Linear brushes work best at 1 ft/s (0.3 m/s). Their wave tolerance is generally good since water flows through the brushes, but response of the entire skimming system depends on the sea-worthiness of the working platform. Excessive movement of the brush packs in waves due to vessel pitch and roll reduces oil recovery rate, particularly if brush packs are bow-mounted (side collectors are more common). Light oils, e.g., diesel, are not effectively recovered with most standard brushes due to low recovery rate and percent oil recovered.

Advantages	Disadvantages
• Suitable for weathered or emulsified oil • Relatively simple mechanical design (e.g., comb/scraper system) • Flow of oil into brushes not affected by waves if units are mounted on stable vessels • Can tolerate some debris	• Low pickup rate of light oil • Oil losses under booms of side collectors possible • Bow-mounted collectors affected by vessel movement/ bow wave interference • Not effective in stationary conditions

9.3.14 Water Jet

Operating Principle

Nozzles on a pressurized pipe spray water over an inclined weir. Entrained water rises and carries oil over the weir lip. Once over the weir lip, a containment boom, skimmer sump or other oil collection system retains the oil.

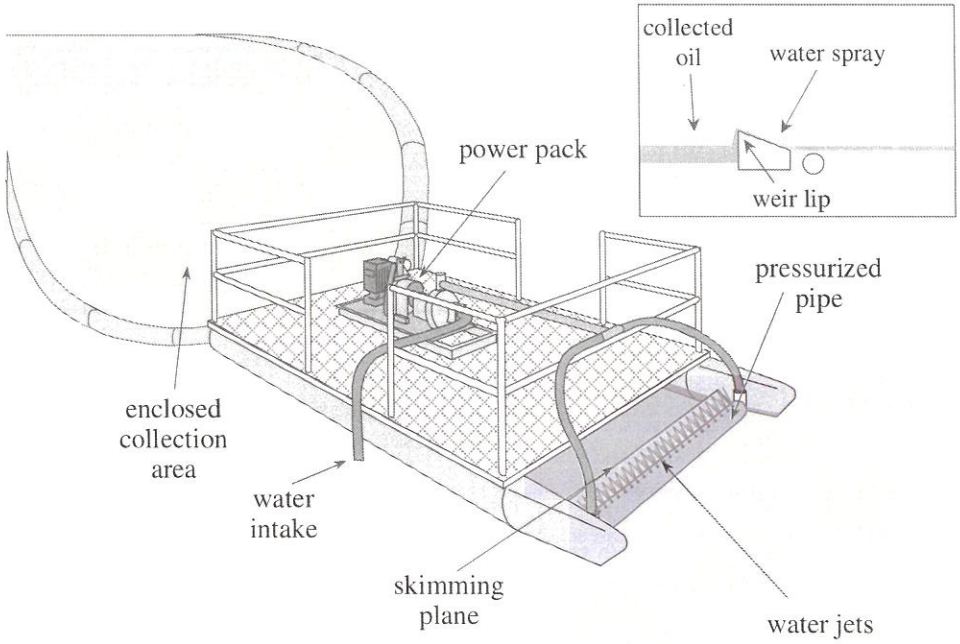

Figure 9-17 Water Jet Skimmer

Expected Performance		
Low viscosity oil	**Medium viscosity oil**	**High viscosity oil**
○	○	○

The water jet skimmer system functions by directing, confining, and concentrating slicks in a boom or other enclosed collection area so that the oil can be more efficiently recovered. As such, this skimming system is normally used in calm water.

Mode	Sea State	Debris Tolerance	% Oil Recovery
Stationary	Calm	◑	◑

Water jet skimmer systems can concentrate oils spanning a wide range of viscosity. However, high viscosity oils can be difficult to recover due to pumping problems.

Advantages	Disadvantages
• Integral, closed boom of some systems provides large storage area • Good oil/water separation achieved in storage area if sufficient residence time is allowed before pumping • Induces oil flow into the skimmer (including slicks in inaccessible areas) • Not affected by small debris • Gentle collection generally does not emulsify oil although some time may be required to allow separation	• Reduced performance in choppy water • Requires sufficient power to operate water jets • Does not work well in sub-freezing temperatures • Oil removal is required from the collection area using a skimmer or vacuum system • Emulsification of oil can occur in some models

9.3.15 Submersion Plane/Belt

Operating Principle

As the skimmer advances, oil is forced downward by a plane or moving belt (Figure 9-18). Once past the belt, the buoyancy of the oil causes it to rise up into a collection well from which it is pumped to onboard storage. Water leaves the collection well through a flow control gate (Figure 9-18 inset). Variations of this skimmer type have been designed that include porous plane and oleophilic belt elements.

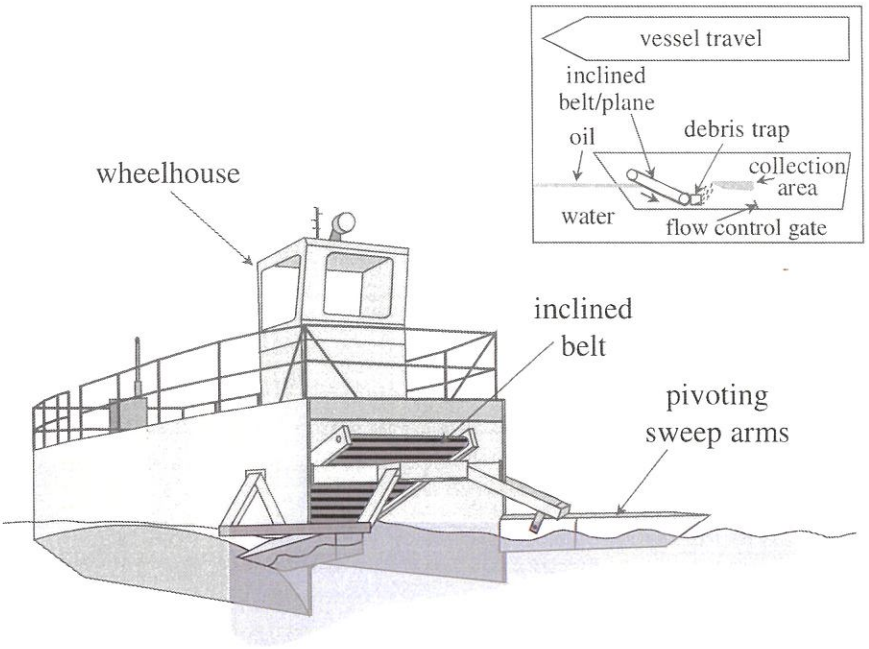

Figure 9-18 Submersion Plane/Belt Skimmer

Expected Performance		
Low viscosity oil	**Medium viscosity oil**	**High viscosity oil**
◑	○	◑

Submersion plane/belt skimmers are effective in medium viscosity oils. Skimming in currents up to 3 kts (up to 1.5 m/s) is possible with some submersion plane models. Oils that are neutrally buoyant can pass under the collection well and escape recovery.

Mode	Sea State	Debris Tolerance	% Oil Recovery
Advancing	Open	◑	◑

Due to limited onboard storage in many models, recovered liquid must be pumped to support vessels. These skimmers can be relatively difficult to maintain since some components are mechanically complex.

Advantages	Disadvantages
• Suitable for medium viscosity oils • Can tolerate some debris and ice	• Debris that passes through the debris trap can impede recovery and requires messy, onboard removal • Less effective for both light and heavy oil • Skimming performance can be affected by vessel movement/bow wave effects

9.3.16 Rotating Vane

Operating Principle

A rotor with a series of vanes rotates beneath the water surface and draws oil towards the weir lip. Water passes through the vanes and is discharged below the skimmer. Recovered oil collects in a sump and is then pumped to remote storage.

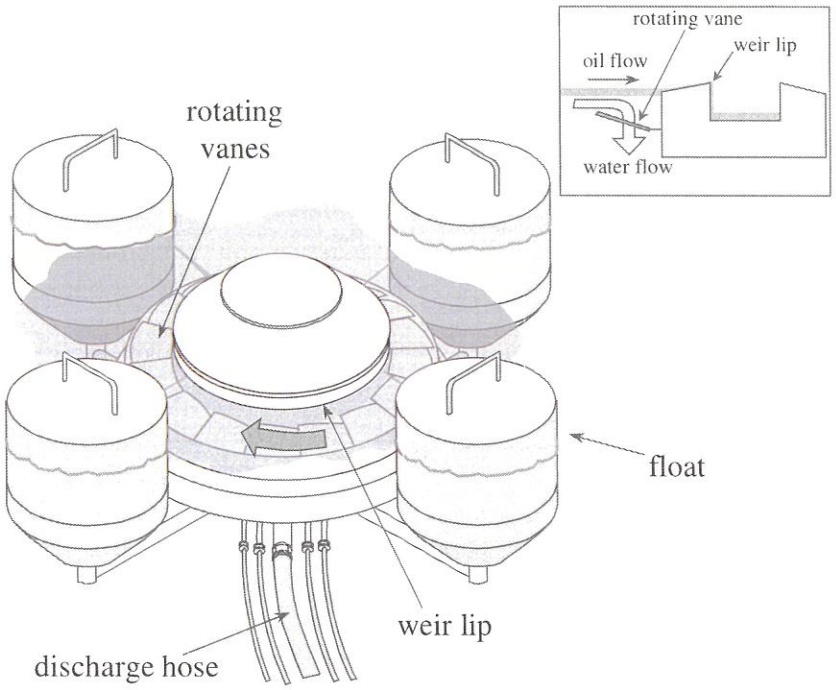

Figure 9-19 Rotating Vane Skimmer

Expected Performance		
Low viscosity oil	**Medium viscosity oil**	**High viscosity oil**
○	○	◑

Rotating vane skimmers pick up light-to-medium viscosity petroleum products. High viscosity oils either flow under the skimmer or can accumulate on the rotors.

Mode	Sea State	Debris Tolerance	% Oil Recovery
Stationary	Calm	◑	◑

Skimmers that induce flow to collect oil are generally effective in thick layers of low-to-medium viscosity oil in calm water. Waves can disrupt the desired flow pattern and prevent the entry of oil into the system.

Advantages	Disadvantages
• Lightweight, can be easily deployed and retrieved • Capable of drawing oil from several feet (1 meter) away • Work best in thick, contained oil • The shipping container of one version also serves as an oil/water separator	• When operated in thick layers of high viscosity oil, recovery rate is limited in models that utilize a remote pump • Pumping rate must be closely monitored to avoid high water pickup because oil collection is hidden below the skimmer • Long stringy debris, e.g., kelp, can clog rotor • Waves and currents can interfere with the vanes

9.3.17 Paddle Belt

Operating Principle

A series of paddles mounted on a moving belt rotate downward into the slick and convey the oil and water held against a baffle underneath the belt into a collection/ separation tank. The collected mixture is allowed to separate and the water is discharged.

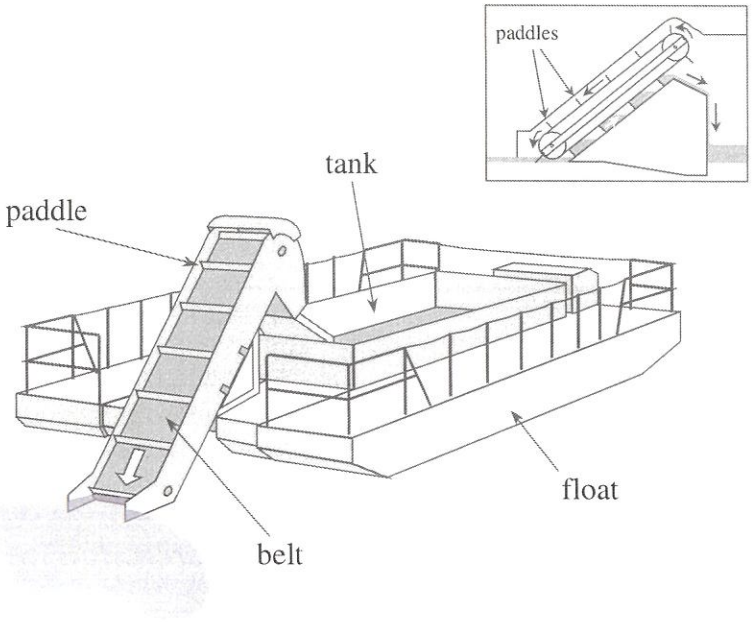

Figure 9-20 Paddle Belt Skimmer

Expected Performance		
Low viscosity oil	**Medium viscosity oil**	**High viscosity oil**
◑	○	○

Operational Considerations

Mode	Sea State	Debris Tolerance	% Oil Recovery
Stationary	Calm	○	○

Paddle belt skimmers are well suited to recovery of viscous oil and debris in calm water. These skimmers recover large amounts of water if the belt is rotated too quickly or in waves.

Advantages	Disadvantages
• Effective in contained oil with medium or high viscosity • Can tolerate most types of debris and some ice • High recovery rate in thick oil layers • Adjustable skimming head allows deployment of belt over booms	• Perforated plate models can be clogged by long, stringy debris • Limited to the recovery of high viscosity oils in calm water • Pick up high percentage of water in thin slicks

9.4 Material Take Off (MTO) List

There are a number of types of equipment required to successfully deploy and maintain skimming operations.

Table 9-5 Material Take Off List for Skimmers

Equipment	Use
Skimmers	Oil recovery
Booms	Oil containment
Pumps/hoses	Oil transfer
Storage	Temporary storage
Fittings	Connecting hoses, pumps, skimmers
Heaters	Assist in oil recovery
Tools	Setup, repair, maintenance
Rope	Positioning of skimmers
Cable	Positioning of skimmers
Vessels	Deployment/positioning of skimmers
Generators	Power for lights, heat, communications
Floodlights	Night-time operations
Oil-water separators	Reduction of oily wastes
Demulsifiers	Oil-water separation
Aircraft	Slick spotting, positioning of skimmers
GPS	Positioning skimmers, activity documentation
Sorbents	Cleaning equipment
Protective equipment	Protection of personnel
Crane/Davit	Used to raise and lower heavy equipment

10 Sorbents

10

10.1 Introduction

Sorbents are used to recover small amounts of oil through **ab**sorption, the penetration of oil into the sorbent material, and/or **ad**sorption, the adherence of oil onto the surface of sorbent material. To enhance recovery, most sorbents are both oleophilic (attract oil) and hydrophobic (repel water).

Use of sorbent materials on large spills on water is generally limited by five factors:

- Logistics of applying and retrieving sorbents on wide-spread slicks
- Labor-intensive nature of the operation
- Relative high cost (versus small skimmers)
- Relative low recovery rates
- Large amount of solid waste generated

In general, use of sorbents is only appropriate during the final stages of a cleanup or to aid in the removal of thin films of oil. Sorbents can also be used to clean up secondary spills, and protect and/or clean environmentally sensitive areas, such as turtle egg-laying areas or marshes, where the use of other cleaning methods is restricted because of the damage they could cause.

10.2 Selection Criteria

All sorbents are effective to some extent. To optimize selection of a particular sorbent product, the properties of a sorbent must be tailored to fit spill conditions. Sorbents that may be useful in one situation may be less desirable in another. In an emergency situation, however, use whichever sorbent is handy until a preferable one can be obtained. Parameters to be considered are discussed below.

10.2.1 Capacity

- Oleophilic and hydrophobic properties are desirable.
- Sorbents should have a high oil/water sorbing ratio when used in water.
- Field sorbent capacity is likely to be less than test data indicate. It may require approximately 25% more sorbent than suggested.
- Suitability of sorbent material depends on oil type and degree of weathering.

10.2.2 Rate of Sorption

- Light oils are sorbed rapidly.
- Sorption time required for saturation is much longer for viscous oils.
- Rate and effectiveness of sorption are proportional to the surface area of sorbent exposed to oil.
- Recovery rate decreases as the oil film becomes thinner. Booms can contain and thicken an oil layer to enhance the use of sorbents.

10.2.3 Buoyancy

- High buoyancy permits sorbents to float for long periods (days or weeks), even when saturated with oil and water.
- Some natural fibers, such as straw and peat moss, have high initial buoyancy but become waterlogged and sink.
- Excessive buoyancy may reduce efficiency to the point that sorbents need to be forced down into the oil to saturate them.

10.2.4 Oil Retention

- Some sorbent materials release much of the oil when the saturated sorbent is lifted out of the water.

10.2.5 Effect of Dispersants

- Dispersants prevent oil from sticking to a sorbent's oleophilic surface.

10.2.6 Suitable Uses

- Matted, lightweight (50 g to 200 g (2–7 ounces) per sheet) sorbent can be blown off the oil surface in strong winds. Two to three sheets in layers are more effective in windy conditions.
- Distribution of sorbents on oil contained in booms can effectively suppress waves and prevent the oil from splashing over the boom.

10.2.7 Reusability

- Reusable sorbents reduce waste.
- Some sorbents work better when "primed" or previously wetted with oil.
- Repeated handling and the need for wringers and storage containers increase the difficulty of applying reusable sorbents.

10.2.8 Ease of Retrieval

- Recovery of floating sorbents is very difficult but may be achieved by use of fishing techniques (such as seining nets) or some belt skimmers, provided they are not prone to clogging.
- Retrieval problems preclude use of uncontained particulate and loose sorbents on water.

10.2.9 Biodegradability

- In situations where material is difficult to recover, a sorbent should be environmentally safe and biodegradable.
- Sorbent products that incorporate nutrients can enhance biodegradation; however, the need for nutrients should be determined to avoid creating a eutrophic environment.

10.2.10 Disposal

- Sorbent selection should consider the ultimate disposal plan.
- Disposal facilities, whether for burial or incineration, generally need to be approved by regulatory authorities prior to the disposal of sorbents.
- Bag and/or drum requirements for storage of recovered sorbents should be calculated based on the quantity of sorbent to be distributed and the volume of oil likely to be sorbed.
- Sorbents must be burnable and not contain too much water for incineration.

The latest edition of the *World Catalog of Oil Spill Response Products* includes a listing of currently available sorbent materials and their suppliers. Also useful are sorbent test results from Environment Canada (Environment Canada, 1991, in Selected References Section of this manual).

Composition of sorbents can be grouped into three main types:

- Synthetic
- Organic
- Inorganic

Synthetic materials, such as polyethylene and polypropylene, generally offer superior oil recovery efficiency compared to organic and inorganic materials, such as peat moss or vermiculite. Typical materials and suitable applications are presented in Table 10-1.

Table 10-1 Sorbent Selection Matrix

Sorbent Type	Typical Materials	Considerations for Use
Synthetic	• Polyethylene/ polyurethane foams and pads • Polypropylene fabric, nets and ribbons • Nylon fabrics and strips • Polyester/cotton fabrics (windshield cleaner cloth)	• Generally the most effective (some absorb up to 25 times their weight of oil); highly oleophilic/hydrophobic • Available in many forms: rolls, sheets, blankets, open netting, pom-poms, loose, etc. • Not biodegradable but most are environmentally safe (inert) • White or light-colored products are preferred for oil visibility; avoid black/ dark colors • High surface area products are good for application to viscous oils • Some products are treated with surfactants to enhance oleophilic properties • Some are reusable
Organic	• Straw • Peat moss • Sawdust • Coconut fiber • Chicken feathers • Cork • Cellulose fiber • Biodegradable sponge • Ground corn cobs • Wool • Wood chips	• Generally absorb 5–10 times their weight • Biodegradable • Have been used to immobilize oil in sensitive environmental areas (e.g., marshes) to protect vegetation and wildlife • Some products are treated to enhance oleophilic properties • Many sink fairly rapidly when soaked • Primarily loose materials that are difficult to recover
Inorganic	• Perlite • Vermiculite • Glass wool • Volcanic rock	• Generally absorb 3–6 times their weight • Relatively inexpensive • Difficult and sometimes hazardous to apply • Some sink and cannot be recovered

10.3 Types of Sorbents

Sorbents are fabricated from various materials in many forms. Examples are shown below. Linear materials, such as pads, rolls, and boom, can be handled as one unit. Particulate sorbents consist of fine materials that are typically spread over the land and then recovered by scraping, raking or vacuuming. Other forms include loose fill that is spread over the spill and recovered mechanically.

	Boom • sorbent material, cylindrically-shaped and deployed like a boom • some models have ballasted skirt and flotation core
	Pads • sheets of sorbent material available in various configurations, e.g., melt-blown, sonic-bonded, laminated and air-laid
	Pillows • sorbent material enclosed in a small sack, which can be easily handled and placed in confined areas
	Pom-poms • bunches of oleophilic strips • can be strung together on a rope as a snare boom
	Rolls • continuous sheet of sorbent material
	Sweeps • long sheets of sorbent material, reinforced with rope and stitching
	Other • other forms include socks, barriers, loose fill, and particulate

10.4 Application

Wide use of sorbents is limited by the intensive labor required, the amount of solid waste generated and other factors listed in Section 10.1. Suitable application of sorbent includes:

- final recovery of residual spilled oil in nearshore areas or locations inaccessible to vessels and equipment
- rapid containment of or response to small, inshore spills while slicks are fresh and relatively thick
- cleaning and wiping lightly-oiled surfaces, such as short segments of rocky shoreline
- covering boat decks, piers, walkways, etc. to prevent contamination of vessels, vehicles, offices or any designated "clean" area
- protecting or cleaning of environmentally sensitive areas, such as turtle egg-laying areas or marshes, where other cleaning methods are restricted because of the damage they could cause

Application techniques for commonly used sorbents are shown in Table 10-2.

Table 10-2 Sorbent Material Application Techniques

Sorbent	Technique
Pads (squares and strips)	• Placed in confined areas to collect small quantities of oil. They should be left for several hours in spilled oil for greater effectiveness • Pads can be wrung out with a simple wringer and re-used
Rolls	• Used in the same manner as squares and strips, but usually more convenient since they can be either torn or cut to an optimum length • Very effective in protecting walkways, boat decks, working areas, previously uncontaminated or cleaned areas; can be used to cover areas used as temporary storage sites for oily materials • Disposal is facilitated by rolling-up the sorbent and placing it in a suitable container

Table 10-2 Sorbent Material Application Techniques (continued)

Sorbent	Technique
Boom	• Can serve a dual function by absorbing and containing oil, but only effective in very calm waters • Most effective on thin films of oil • Tightly compacted sorbent material encased in mesh restricts oil penetration, requiring a boom to be rotated and moved around in the oil to work efficiently. It is usually better to drive oil into the boom. • Solid "sausage" boom is better than loosely packed "pop-corn" (granular) boom. Loosely packed granules absorb more water and mesh bags break easily, requiring additional cleanup effort. • Can be used effectively to protect sheltered areas against oil contamination; also can be deployed behind skimmers to collect excess or missed oil, but not generally effective when used this way • Disposal is accomplished by folding, rolling, and/or stuffing a boom into plastic bags for disposal.
Pom-poms and snare booms	• Most effective on viscous or weathered oil • May be used to recover oil both on shore and in the water • Can be strung together and placed in intertidal area to recover oil • Can be used to seal the shore end of a boom so that no oil escapes. This is particularly useful in tidal waters, especially where the bottom is rocky or strewn with boulders. • Often used as a composite barrier inside a containment boom to limit the escape of oil under varying wind, wave and current conditions • Disposal is accomplished by stuffing the material in a plastic bag for disposal
Loose materials	• Loose sorbent materials are not recommended for use in spills on water; however, loose organic materials have been successfully used to stabilize stranded oil in remote locations.

10.5 Solidifiers

Solidifiers are typically polymeric products that react with oil to bind it into a cohesive mass, immobilizing it and reducing the rate of spreading and thinning. They have been successfully used on small harbor spills of light products and on spills to land. If applied to oil on water, the solidified mass may float until fishnets, perforated shovels or other pickup devices can physically remove it from the water. Because solidifiers are applied as powders, granular mixes, or gels, they are generally impractical for wide-scale application at large spills.

The following points summarize the strengths and weaknesses of solidifiers:

- unlike sorbents, solidifiers must generally be registered with and approved for use by government agencies
- large amounts of solidifier material (10–40% by weight of the oil mass) must be applied for full effectiveness
- solidifiers are most effective on light oils and at higher temperatures
- solidifiers can reduce the vapor emission rate of oil but care must be taken in storing solidified oil because hydrocarbon vapors can still build up over time
- some sinking agents market themselves as solidifiers; sinking agents should not be used on an oil spill
- solidifiers are effective in either a fresh or sea water environment
- most solidifiers are readily combustible so incineration is a feasible disposal option

11 Transfer Systems

11

11.1 Introduction

In oil spill response, transfer systems include pumps and means of transport of recovered oily waste. This chapter focuses on pumps because of their importance on initial oil recovery.

Pumps are used during oil spill response to transfer oil, water, emulsions, and dispersants. Recovered liquids typically need to be transferred:

- From a skimmer to interim storage
- From interim storage to a transportation vessel/vehicle
- From a transportation vessel/vehicle to a final storage/disposal facility

Preplanning recovered oil transfer is critical to ensure continuity of oil spill response operations.

Transfer systems must be selected to suit the quantities and types of liquids being moved. Although a wide range of pumps can be used for fresh, unemulsified oils, pump options can become limited as transfer conditions become more difficult. Careful consideration must be given to each specific transfer situation, particularly in the case of long-term mechanical recovery operations since over time, oil weathers, viscosity increases, and debris is collected.

Pumps may be used to off-load unspilled oil from stricken vessels (called "lightering") and to transfer dispersants from drums and temporary storage tanks to dispersant application systems.

Generally, spill cleanup does not require pumps with extreme capabilities. The head through which the pump must push liquid is usually about 6 to 20 ft (2 to 6 m) and suction lift from a skimmer to a pump is often much less (i.e., only a few feet or about a meter). In some cases, a large head is required, especially when oil is pumped from a skimmer to a large, unballasted barge or storage vessel. In this case, the head required may be 30 ft (10 m) or more.

Some pumps are more suitable for oil spill work for the following reasons:

- They self-prime and maintain prime if used on a skimmer and the skimmer rolls.
- There is provision for draining when shut down. This is essential in cold weather.
- Pumping capacity is steady even with slight increases in oil viscosity.
- Cavitation does not occur when pumping warm or high viscosity oil.
- Emulsification of water in oil and water is not increased by pump design.
- Debris tolerant.
- Parts are oil-resistant.

Pumping viscous oils may be difficult as friction caused by the oil traveling down a hose may reduce flow. To help minimize pressure loss, an annular injection flange may be connected to the discharge hose. The flange allows the injection of a small layer of water or steam around the oil passing through the hose reducing the total pressure loss. See Section 11.3.12 Annular Injection for more information.

11.2 Pump Selection Matrix

The Pump Selection Matrix in Table 11-1 lists 13 generic types of transfer pumps that are generally available worldwide and 15 selection criteria for them. An overall evaluation of each pump follows the table.

To use the Pump Selection Matrix, follow these steps:

Step 1 Identify the type of fluid and/or debris that needs to be transferred. Select pumps that will perform well in moving such material(s).

Step 2 Identify other criteria critical to the situation (e.g., portability) and rank them in order of importance. Search the Matrix for these criteria in descending order of importance, each time selecting the highest rated pump(s) which have not been eliminated in a previous step.

11.2.1 Pump Selection Example

A pool of highly viscous, weathered oil has collected in a remote swampy area. During the recovery process, it is likely that a considerable amount of silt and other small debris will be picked up with the oil. An example of the process of selection is as follows:

- Step 1. The area and conditions suggest that the most feasible oil removal method is a pump. Although rated "good" for handling silt, the vacuum truck is excluded because of its size and difficulty in gaining access to the site. The portable pumps best suited to moving highly viscous fluids are:
  - Lobe
  - Gear
  - Intermeshing Screw
  - Screw/auger
  - Progressive Cavity
  - Reciprocating
- Step 2. Because this is a difficult transfer operation, silt/sand and debris requirements take priority over transfer rate. Of the pumps picked in Step 1, only two have a rating of "good" for handling silt/sand:
  - Screw/auger
  - Progressive cavity
- Step 3. If there is a possibility of gravel being present, then the screw/auger pump should be chosen because of its higher tolerance for this type of debris. For drawing suction from distance, the progressive cavity is the preferred choice. Pump availability should then be verified.

Table 11-1 Pump Selection Matrix

	Characteristics of Transfer System															
	Fluid Type			Debris Tolerance			Other Criteria									
	High Viscosity	Medium Viscosity	Low Viscosity	Silt/sand	Gravel/particulate	Seaweed, stringy material	Transfer rate	Low emulsification tendency	Ability to run dry	Ability to operate continuously	Self-priming	Suction head	Back pressure/head	Portability	Ease of repair	Notes

Legend ○ Good ◑ Fair ● Poor N = Not Applicable

Notes:

1 Normally have remote power sources — are safe around flammable fluids
2 Should have a relief valve in the outlet line to prevent bursting hoses
3 Air-powered models tend to freeze-up in sub-freezing temperatures
4 Units with worn ball valves are difficult to prime
5 Some remotely-powered models are designed to fit inside a tanker's Butterworth hatch
6 Can also pump air at low pressure
7 Transfer is pulsating rather than continuous
8 High shear action tends to emulsify oil/water mixtures

11.3 Detailed Information on Pump Types

11.3.1 Centrifugal Pump

Operating Principle

Liquid enters a pump at the center of a rapidly rotating fan-shaped impeller. Centrifugal force then accelerates fluid toward the impeller's outer edge. From there, the fluid exits through a nozzle on the periphery of the impeller housing. Pressure generated by this pump is from the kinetic energy imparted to fluids by the impeller.

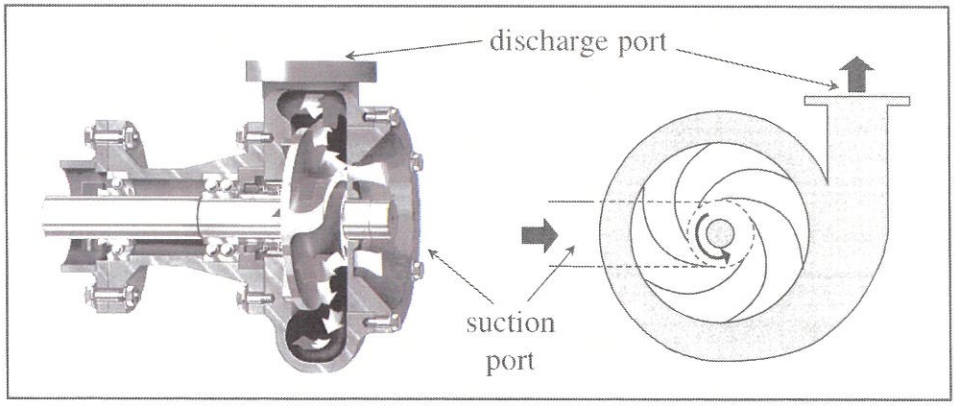

Figure 11-1 Centrifugal Pump

Suitable Uses

- Pumping low viscosity fluids at high rates for short distances
- Supplying water to dispersant spray booms or fire nozzles
- Flooding shoreline with seawater to prevent oil from sticking to soil
- Unloading drums of chemicals, fuels, etc.
- Mixing demulsifier chemical into emulsified oil

Advantages	Disadvantages
• Small, lightweight, easy to handle • High capacity with low viscosity fluids • Inexpensive, considering output capability • Mechanically simple (one moving part) • Tolerant of most debris • Easy to repair in the field	• Output decreases markedly with increasing viscosity of fluid • Many models are not self-priming • May generate oil/water emulsions • Pump performance impaired by stringy debris

11.3.2 Lobe Pump

Operating Principle

Incoming fluid fills cavities between the lobes of two rotating elements and becomes trapped where two adjacent lobes seal against a wall of the pump housing. As lobes rotate, trapped fluid is carried to the pump outlet. When a leading lobe loses contact with a wall, oil trapped in the cavity is forced out of the pump. This means that pumping rate is a function only of rotational speed. This pump shows little or no decrease in pumping rate with increasing fluid viscosity. Because very high pressure can develop in the discharge line, the outlet side should be equipped with a relief valve to prevent a discharge hose from bursting when viscous fluid is pumped at a high rate.

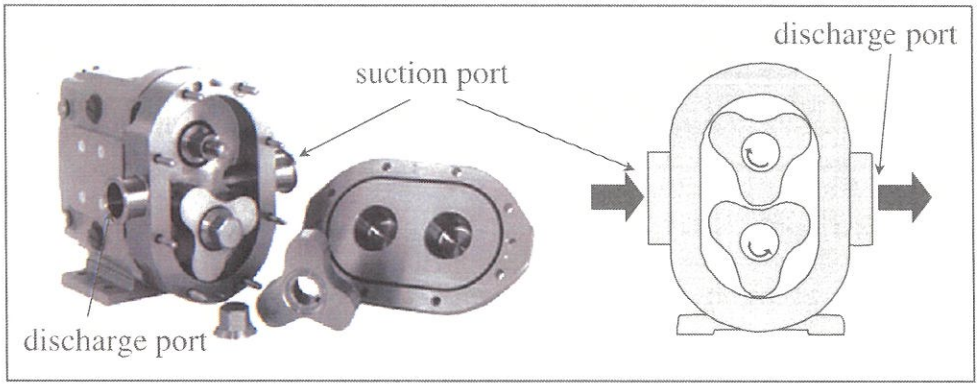

Figure 11-2 Lobe Pump

Suitable Uses

- Mixing viscous emulsions with demulsifier chemicals
- Pumping clean, solids-free fluids
- Feeding viscous emulsions to incineration devices
- Metering dispersant into spray boom systems

Advantages	Disadvantages
• Pumps high viscous fluids at a constant rate • Pumps against high back pressure • Gear-driven models can be run dry without serious damage	• Relatively slow pumping rate • Most models cannot tolerate sand or other abrasive debris • Non gear-driven models cannot be run dry

11.3.3 Gear Pump

Operating Principle

A gear pump works on the same principle as a lobe pump. It usually has close tolerances and many points of metal-to-metal contact. For this reason, a gear pump cannot process large particulate matter or highly abrasive solids. Most gear pumps are bi-directional.

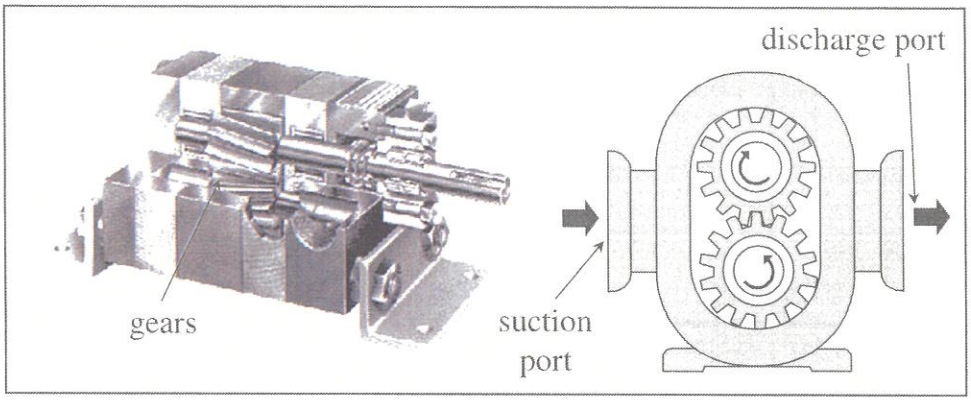

Figure 11-3 Gear Pump

Suitable Uses

- Mixing viscous emulsions with demulsifier chemicals
- Pumping clean, solids-free fluids
- Feeding viscous emulsions to incineration devices
- Metering dispersant into spray boom systems

11

Advantages	Disadvantages
• Pumps very viscous fluids at a constant rate • Pumps against high back pressure • Gear-driven models can be run dry without serious damage	• Relatively slow pumping rate • Most models cannot tolerate sand or other abrasive debris • Non gear-driven models cannot be run dry

11.3.4 Intermeshing Screw Pump

Operating Principle

Intermeshing screw pumps are very similar to gear pumps, but the area of contact between gears is higher in the screw pump. They are especially well suited for pumping clean viscous fluids at high pressures. Intermeshing screw pumps cannot tolerate abrasive solids.

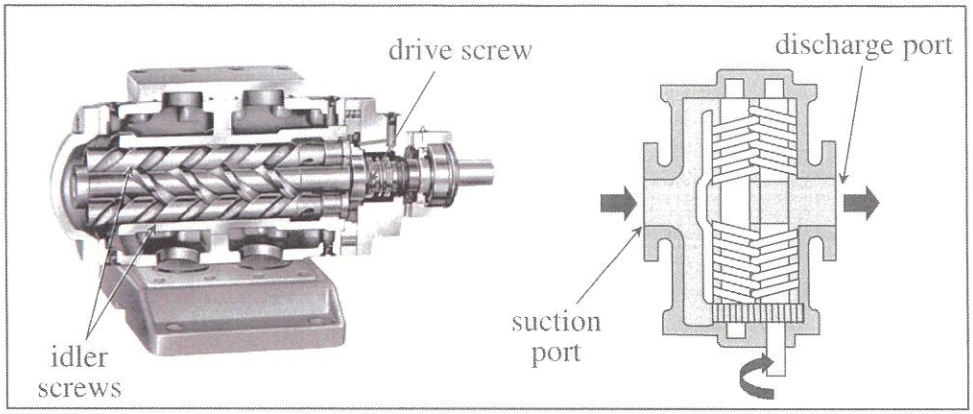

Figure 11-4 Intermeshing Screw Pump

Suitable Uses

- Mixing viscous emulsions with demulsifier chemicals
- Pumping clean, solids-free fluids
- Feeding viscous emulsions to incineration devices
- Metering dispersant into spray boom systems

11

Advantages	Disadvantages
• Pumps very viscous fluids at a constant rate • Pumps against high back pressure • Gear-driven models can be run dry without serious damage	• Relatively slow pumping rate • Most models cannot tolerate sand or other abrasive debris • Non gear-driven models cannot be run dry

11.3.5 Rotary Vane Pump

Operating Principle

A number of mechanical elements extend radially from a central rotating shaft and seal against the inner wall of the pump housing. A seal is accomplished by spring action. A rotating cavity fills with fluid that is transported from the inlet port to the outlet port by a 180° rotation of the central shaft. There is no clearance and because of metal-to-metal contact, vane pumps are sensitive to debris and abrasives.

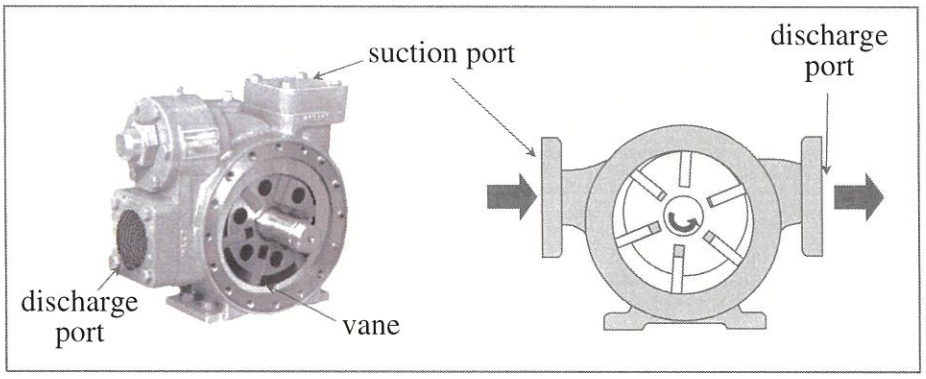

Figure 11-5 Vane Pump

Suitable Uses

- Pumping clean, solids-free fluids from offshore skimmers
- Emptying drums of chemicals or fuel
- Pumping seawater to dispersant spray booms
- Metering dispersant chemicals into spray boom systems
- Pumping oil and water from flexible storage containers to shoreline pits or incinerators

Advantages	Disadvantages
• Small, compact, and easy to handle and repair • Efficiently pumps both low and high viscosity fluids	• Cannot be run dry • Not available in a wide variety of sizes • Sensitive to abrasive solids

11.3.6 Flexible Impeller Pump

Operating Principle

A number of mechanical elements extend radially from a central rotating shaft and seal against the inner wall of the pump housing. A seal is accomplished by deforming the radial elements. A rotating cavity fills with fluid that is transported from the inlet port to the outlet port as the central shaft rotates. Flexible impeller pumps can deform around small, suspended particles and pass them without significantly reducing suction or pressure.

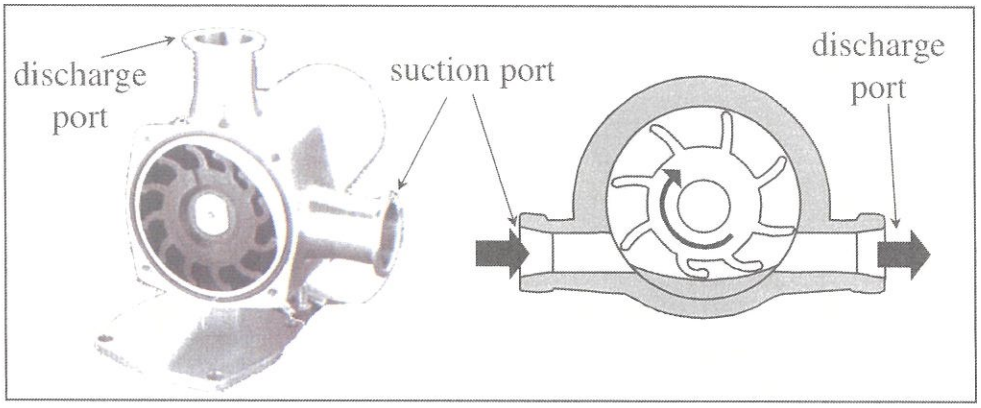

Figure 11-6 Flexible Impeller Pump

Suitable Uses

- Pumping fluids from offshore skimmers
- Emptying drums of chemicals or fuel
- Pumping seawater to dispersant spray booms
- Metering dispersant into spray boom systems
- Pumping oil and water from flexible storage containers to shoreline pits or incinerators

Advantages	Disadvantages
• Self-priming • Can handle small suspended particulates • Small, compact, and easy to handle and repair in field • Efficiently pumps both low and high viscosity fluids	• Cannot be run dry • Not available in a wide variety of sizes • Some models have impellers that are not oil-resistant

11.3.7 Screw/Auger Pump

Operating Principle

Oily material is gravity fed to a screw through a large hopper. As the screw rotates, it carries an oily mixture forward until a special rotary lobe scrapes oil from the groove and forces it out the front of a pump. Debris that fits between the "threads" of a screw is processed. A special cutter at the edge of a hopper can cut long stringy debris, so it can also be pumped. Because of its low rotational speed and the relatively loose clearance between screw, housing, and lobe, this pump has very little self-priming or suction capability.

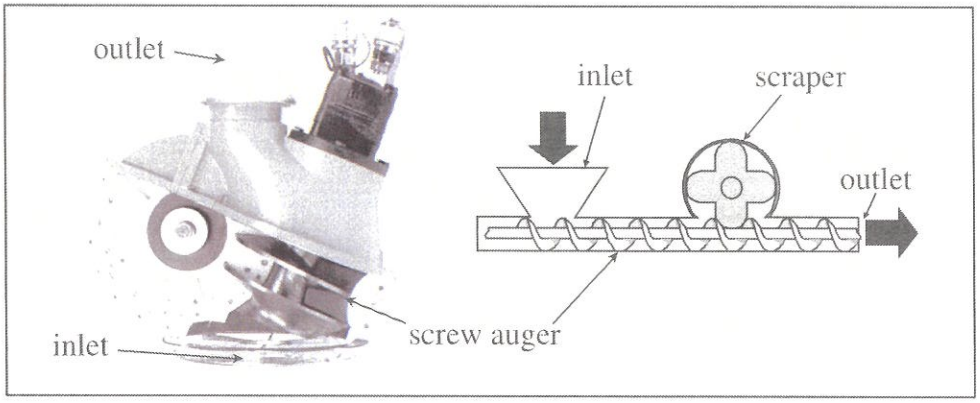

Figure 11-7 Screw/Auger Pump

Suitable Uses

- Pumping weathered crude or mousse
- Off-loading recovered oil from storage barges
- Transferring contents of earthen storage pits to incinerator
- Transferring oil/ice/snow slush

Advantages	Disadvantages
• Can pump highly viscous or semi-solid materials • Processes most debris • Does not emulsify oil/water • Some models can be run dry • Some models are integral with a weir skimmer	• Some models (with nylon casing) cannot be run dry • Not self-priming • Poor suction/lift capacity • Relatively low pumping rate for its power • Relatively expensive for capacity • Can develop high back pressure

11.3.8 Progressive Cavity Pump

Operating Principle

A spiral rotor turns inside a stationary chamber or stator to create pockets that move continuously towards the outlet. A rotor is a smooth, polished metal spiral or helix. A stator is similar in shape, but with only half the pitch of a rotor. It is made of a pliable, oil-resistant rubber, such as neoprene, Buna N, or polyurethane. As fluid enters a pump, it fills part of the cavity adjacent to the inlet. As the rotor turns, its specially shaped lobes seal against the stator and push fluid down the barrel in an advancing or progressing cavity. Pumping action is very gentle and tends not to emulsify oil and water. Depending on the size of cavities, this type of pump can pass solid particles, such as wood pieces, gravel, and ice, up to one inch (25 mm) in diameter. Because a stator is resilient, this pump can transfer fine abrasive solids effectively.

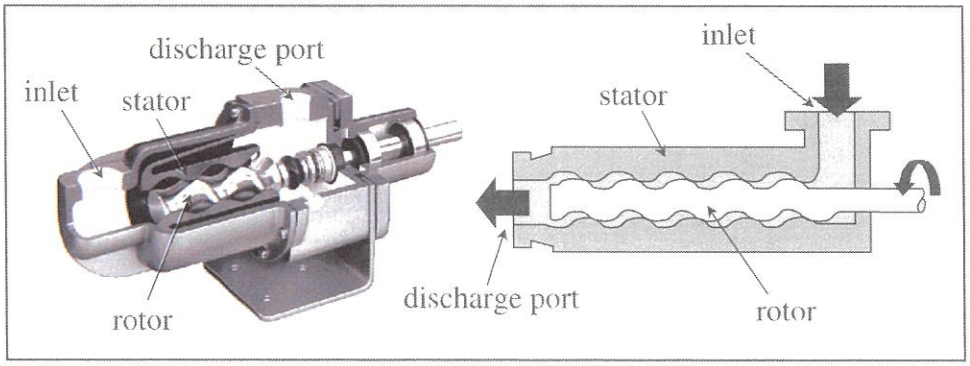

Figure 11-8 Progressive Cavity Pump

Suitable Uses

- Pumping viscous fluids at moderate rates against high back pressure
- Off-loading skimming vessels
- Transferring oil or emulsion from a skimmer to storage
- Pumping oily materials from storage pits to trucks, incinerators, etc.
- Miscellaneous pumping operations around the spill site

Advantages	Disadvantages
• Pumps oil of various viscosities at a constant rate • Can handle most small debris • Self-priming • Does not emulsify oil/water	• Large, heavy, awkward shape • Difficult to repair in field • Should not be run dry • Relatively low pumping rate

11.3.9 Reciprocating Pump

Operating Principle

A drive rod moves a diaphragm to one side of its housing, creating a vacuum in one chamber and pressure in the other. The vacuum opens one inlet valve and closes an outlet valve. When the rod reverses and moves the diaphragm to the other side of a housing, the action of all valves is reversed. Since liquid moves to the discharge port on both forward and reverse strokes of a rod at the same speed as the pump motor, a continuous discharge results.

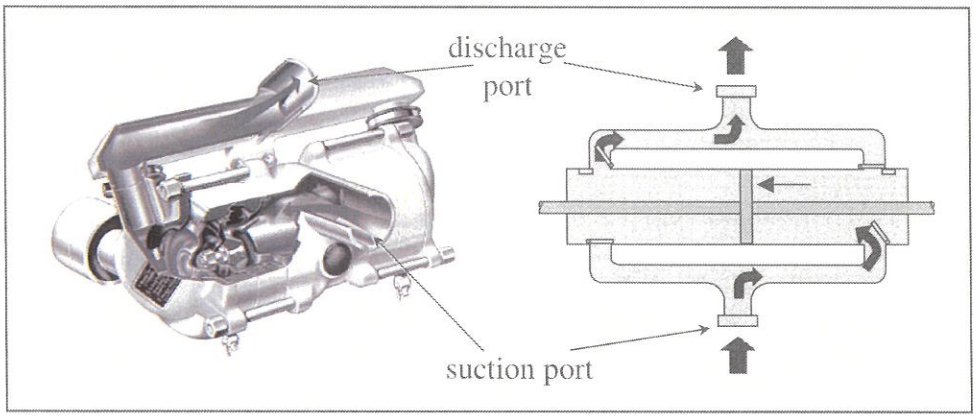

Figure 11-9 Reciprocating Pump

Suitable Uses

- Off-loading low and medium viscosity oils from skimming vessels or barges
- Injecting picked-up oil into incinerator devices

11

Advantages	Disadvantages
• Can pump low to medium viscosity fluids at high pressures • Strong self-priming capability and good suction lift • Processes debris, i.e., small solids • Can be run dry for extended periods	• Some models tend to "walk" if not tethered • Rubber diaphragms wear when exposed to fine abrasives, e.g., sand • Units with worn ball valves are difficult to prime

11.3.10 Diaphragm Pump

Operating Principle

As a diaphragm moves to one side of its housing, it creates a vacuum in one chamber and pressure in the other. The vacuum opens one inlet valve and closes an outlet valve. Pressure opens the other outlet valve and closes the remaining inlet valve. When a diaphragm moves to the other side of its chamber, the action of all valves is reversed. Pumping action gives rise to a slight pulsating discharge. A diaphragm pump has a flexible elastomer piston (diaphragm) with wide clearances between moving parts.

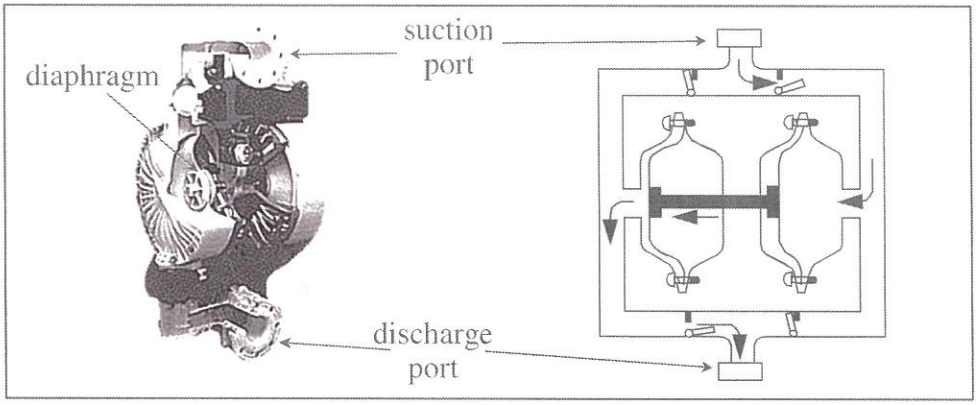

Figure 11-10 Diaphragm Pump

Suitable Uses

- Pumping fluid from small skimmer to nearby storage
- Pumping fluid in hazardous atmospheres (air-operated units)
- Pumping water and/or oil from storage containers to incinerators

11

Advantages	Disadvantages
• Can run dry indefinitely • Can tolerate high concentrations of fine solids • Self-priming and gentle pumping action; good suction lift • Small, portable, easily repaired • Air-operated models are safe around flammable oil	• Diaphragms sometimes burst • Models with worn ball valves do not self prime • Some diaphragm materials are not compatible with oil • Some models require compressor • Cannot operate against high back pressure • Single-acting pumps have strong pulsating action making them less desirable than double-acting pumps

11.3.11 Peristaltic Pump

Operating Principle

The pumping action of a peristaltic pump (also called a "hose pump") is the result of alternate compression and relaxation of a specially designed resilient hose. A hose is compressed between the inner wall of the housing and the compression shoes of a rotor. A liquid lubricant in the housing minimizes sliding friction. The fluid being pumped is in contact only with the inner wall of a hose. During compression, abrasive particles in the fluid are cushioned in the thick inner hose wall, returning to the fluid stream after compression. This pump has no seats, seals, or valves. It is self-priming and can be run dry without damage. Suction, even for medium viscosity materials, is generally excellent.

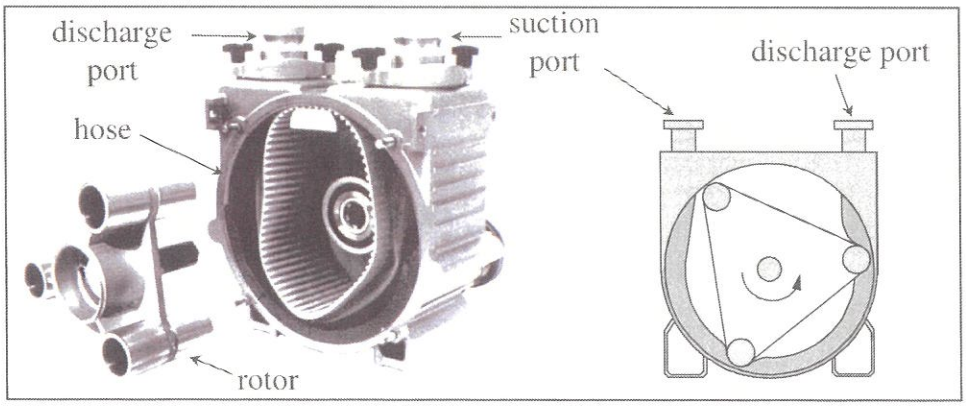

Figure 11-11 Peristaltic Pump

Suitable Uses

- Off-loading light emulsions from skimming vessels or oil storage barges
- Moving low and medium viscosity oils recovered in cold weather conditions as well as for more general use in warmer climates.

Advantages	Disadvantages
• Can be run dry without damage • Can process low to medium viscosity oils • Can pass most debris up to 1 in (25 mm) • Flow reversal can be used to clear blocked hose • Easily repaired in field • Self-priming; good suction lift	• Have pulsating flow • Internal hose wears and can require frequent replacement • Speed control can be difficult in medium viscosity oils • Vacuum on suction line can be lost on medium viscosity oils

11.3.12 Annular Injection

Operating Principle

Pumping flow rates can be adversely effected due to an increase in friction caused by three factors: (1) viscosity, (2) temperature, and (3) debris. An annular injection flange allows an operator to surround the oil within the hose with a layer of water or steam. This layer reduces the friction in the hose and allows for an increase in the distance that recovered oils are able to be pumped or the rate of pumping.

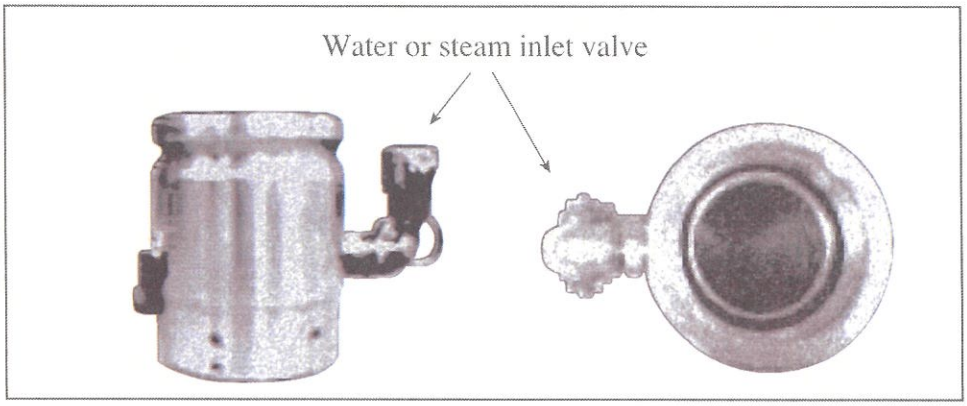

Figure 11-12 Annular Injection Flange

Suitable Uses

- To aid in transferring recovered oil in cold temperatures
- Assist in transferring viscous oil (e.g., emulsions) farther distances

Advantages	Disadvantages
• Assist in transferring oily waste and recovered oil • Compact size and lightweight • Attaches to inlet or outlet side of pumps via camlock fittings	• Not widely available • Secondary unit required to generate steam or pump water

11.4.1 Vacuum Truck

Operating Principle

Vacuum trucks are equipped with high vacuum pumps and a cylindrical chamber capable of sustaining very low internal pressures (i.e., about -14.5 to -12 psig [10–140 mm Hg absolute]). A vacuum is pulled on a chamber and a 3–4 in (8–10 cm) diameter hose is usually placed slightly below the surface of a slick. Depending on slick thickness, a mixture of oil and water enters the collection chamber. Positioning of the intake end of a hose is critical to minimize the amount of water collected. Floating weir skimmers can be attached to the inlet end of a hose to further reduce amounts of water recovered. In this case, a manual flow control valve may be useful.

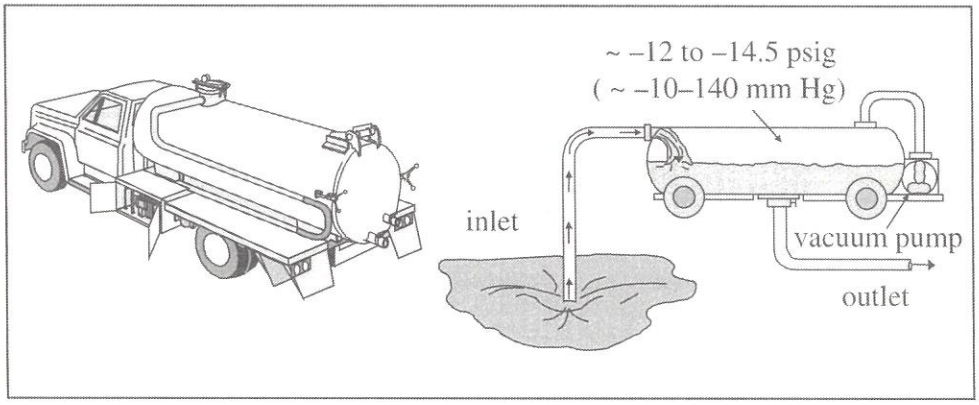

Figure 11-13 Vacuum Truck

Suitable Uses

- Off-loading viscous oil from skimming vessels or storage containers
- Providing suction for weir skimmers
- Removal of oil from boomed areas, earthen pits, flexible storage tanks, etc.
- Transporting recovered oil to a remote disposal site

Advantages	Disadvantages
• Normally readily available in industrialized areas • Can process a wide range of fluid viscosities • Provides transportation once oil is recovered • Does not emulsify oil/water • High pickup rate	• Large and heavy; requires good roads • Slow recovery from loss of vacuum • High water pickup

11.4.2 Air Conveyor

Operating Principle

Portable air conveyors are considered vacuum devices although the amount of vacuum developed in a chamber is relatively low (about -6 to -4 psig [450–550 mm Hg absolute]). Oil and water are entrained in a high velocity (i.e., 150 miles/hr or 240 km/hr) air stream and are conveyed into a collection chamber. Because an air conveyor relies on a steady air flow, the inlet nozzle on an intake hose must be placed slightly above the fluid surface.

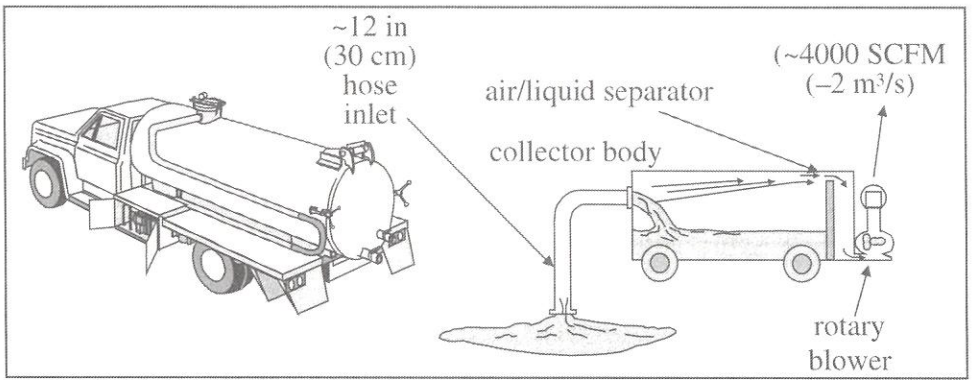

Figure 11-14 Air Conveyor

Suitable Uses

- Picking up weathered oil and tar balls from beaches or near shorelines
- Off-loading viscous oil from skimming vessels, pits, boomed areas, or debris-laden sites
- Moving oil vertically up to 30 ft (10 m)
- Recovery of used oil sorbents
- Providing supply air for portable incinerators

Advantages	Disadvantages
• Can handle most debris • Can process a wide range of fluid viscosities • Can lift fluids up to 30 ft (10 m) • Does not emulsify oil/water • Provides transport of recovered fluids	• Large and heavy; requires good roads • High water pickup • Difficult to make repairs in the field

11.4.3 Wheeled Vehicles

Operating Principle

In practically all oil spill cleanup operations, especially those conducted on or near land, a truck or some other type of wheeled vehicle eventually handles recovered oil and debris. Although vehicles are not usually thought of as transfer systems, they are essential in any cleanup operation. In planning response operations, it is important to match the type of vehicle to the service and road/soil conditions where it will be used. For instance, tank trucks can handle large volumes of water, oil and debris in any proportion. However, because of their heavy weight, they cannot be used on soft soil, unstable sand, or poor roads. Lighter trucks, vehicles with special tires for offroad travel, or light truck/trailer combinations are better suited for operation on beaches and poor roads.

Suitable Uses

- Carry fluids to storage or disposal sites
- Carry oily debris (logs, branches, vegetation, trash, etc.) to disposal sites
- Carry personnel and equipment around spill area

Advantages	Disadvantages
• Can generally handle any type of oil, water, emulsion, or oily debris • Widely available • Spare parts and component repair services are usually available. • Can be used to transfer equipment and personnel	• Limited transfer rate. The largest tank truck typically transfers only 100 barrels (16 m^3) per load. • Large units must have good roads or hard stable soil surfaces on which to operate. • Some units, like flatbeds and pickup trucks, must have separate containers for the waste material they transfer.

11.5 Material Take Off (MTO) List

Various types of equipment are required to conduct transfer operations.

Table 11-2 Material Take Off List for Pumps

Equipment	Use
Pumps	Oily liquid transfer
Suction hoses	Removal of oil/water from skimmers
Discharge hoses	Transfer to storage
Storage	Temporary storage
Fittings	Connectors, adapters, clamps
Tools	Repair/maintenance
Rope	Lashing of pump, hoses
Spare parts	Various
Generators	Power
Water source	Provide steam or water for annular injection
Oil-water separators	Oil-water separation
Demulsifiers	Oil-water separation
Sorbents	Cleanup of equipment
Transport vehicles	Move and/or collect recovered oil

12 Shoreline Treatment

12

12.1 Introduction

The objective of shoreline treatment is to accelerate recovery of oiled shores while minimizing the impact of treatment operations. This approach is consistent with Net Environmental Benefit Analysis described in Section 1.

The selection of an appropriate shoreline treatment technique is based on many factors, including:

- Amount and type of oil
- Shoreline type
- Environmental or cultural sensitivity
- Logistics
- Waste generation
- Safety considerations
- Prevailing oceanographic and meteorological conditions
- Regulatory requirements

The first step in selection is to identify the amount and type/characteristics of the oil that has reached shore. Section 12.2 presents some guidance on how best to achieve this. The first step is shoreline assessment and there is considerable experience and knowledge available which would likely be employed to do this. Most experts use a form to capture the needed information and Section 12.2 describes all the data needed to record details of both the oiling and character of the shoreline. The next step is to select the most appropriate treatment method(s). Section 12.3 provides decision guides to facilitate this process.

Training in the proper use of mechanical equipment is essential for contractors and employees. Training is important to ensure safe operation and avoid accidents, improve oil recovery, minimize collection of clean material, and lessen the impact of equipment on a shoreline

12

A site safety plan must be followed and general safety precautions should be used. Generally, workers will be given a safety briefing designed for the environment they will be working in prior to entering the work area. PPE (Personal Protective Equipment) should be selected to match exposure hazards. Proper electrical grounding of equipment and the use of back-up warning signals are two additional important safety items.

Shoreline treatment options are summarized in Section 12.4 for each shore type. Following a brief review of natural recovery (Section 12.5), each physical treatment method is reviewed in terms of its primary use, physical and biological effects, and the logistical support required including equipment, personnel, and access (Section 12.6). Summaries for bioremediation, and chemical techniques are also presented (Sections 12.7 and 12.8, respectively).

12.2 Assessment of Shoreline Oiling

The following information is used to assess shoreline oiling and its implications for response:

- Shoreline types and coastal character (geologic character and ecological conditions of affected shorelines)
- Amount and properties of an oil that has reached shorelines (possible interactions between any stranded oil and the environment)
- Ecological, cultural, archaeological, human use, or economic constraints/ priorities.

Outputs from assessment surveys are used to develop and implement shoreline treatment plans. During a major oil spill, shoreline oiling must be rigorously assessed before selection of appropriate treatment methods.

Shoreline assessment teams can be used to survey and document affected areas to then provide rapid geographic information on the locations and extent of shoreline oiling conditions. A form is usually employed to ensure that shorelines are characterized uniformly. Figure 12-1 and Table 12-1 present, as an example, the form used by NOAA in the US. The oiling summary form should be completed by a team of experts from a variety of organizations and specialties; e.g., geomorphologist, oil spill specialist, intertidal biologist, and archaeologist. Using a form helps provide a systematic approach to data collection that yields consistent data to aid comparisons among sites. A sketch can be drawn to locate specific oil deposits relative to major features.

Information which can be collected includes:

- General Information, such as date and time of survey, tide height, and some means of labeling or coding the various beach segments for later reference.
- Survey Team members and expertise.
- Some position data on where the segment is. GPS can be helpful, if available.
- Type of shoreline, e.g., rocky, sandy, muddy, wetland, etc. Table 12-1 has some code information which may be useful.
- Amount and distribution of oil on both the surface and subsurface.
- Observations as to sensitivity of the segment, either culturally or ecologically
- Any wildlife issues?

SHORELINE CLEANING ASSESSMENT FORM

1. GENERAL INFORMATION	Date (dd/mm/yy)	Time (24th standard/daylight)	Tide Height L/M/H H/M/L
Segment ID:			
Segment Name:		hrs to hrs	
Survey By: Foot / Boat / Helicopter / Overlook / Other:		Sun / Clouds / Fog / Rain / Snow / Windy	

2. SURVEY TEAM No. _____	Name	Organization	Phone Number

3. SEGMENT — Total Length _____ m/yd — Length Surveyed _____ m/yd — Differential GPS Yes / No

Start GPS: (if applicable) LAT ____ deg. ____ min. LONG ____ deg. ____ min.

End GPS: LAT ____ deg. ____ min. LONG ____ deg. ____ min.

4. SHORELINE TYPE: Select only ONE Primary (P) and ANY Secondary (S) types present

	Rocky Cliffs		Exposed Tidal Flats
	Exposed Man-Made Structures		Exposed Vegetated Tidal Flats
	Wave-cut Platforms		Sheltered Rocky Coasts and Clay Scarps
	Fine-Medium Grained Sand Beaches		Peat and Lowland Flats
	Coarse Grained Sand Beaches		Sheltered Tidal Flats
	Tundra		Salt Marshes and Mangroves
	Gravel and Cobble Beaches		Sensitive Habitats (Coral Reefs, Kelp, Seagrass, etc.)

5. OPERATIONAL FEATURES — Oiled Debris? Yes / No Type _____ Amount _____ bags

Direct backshore access? Yes / No — Access restrictions _____

Alongshore access from next segment? Yes / No — Suitable backshore staging? Yes / No

(Adapted from US National Oceanic and Atmospheric Administration)

Table 12-1 Example Shoreline Oiling Summary (continued)
(Adapted from US National Oceanic and Atmospheric Administration)

SHORELINE CLEANING ASSESSMENT FORM (continued)

6. SURFACE OILING CONDITIONS — Begin with "A" in the lowest tidal zone

Zone ID	Tidal Zone				Oil Cover			Oil Thickness					Oil Character						
					Length	Width	Distr.												
	LI	MI	UI	SU	m/ft	m/ft	%	PO	CV	CT	ST	FL	FR	MS	TB	TC	SR	AP	No

7. SUBSURFACE OILING CONDITIONS — Use letter of Zone location plus Number of trench, e.g., "A1"

Trench No.	Tidal Zone				Trench Depth	Oiled Interval	Subsurface Oil Character						Water Table	Sheen Color	Clean Below?
	LI	MI	UI	SU	cm/in	cm-cm/in-in	OP	PP	OR	OF	TR	No	cm/in	B, R, S, N	Yes / No

8. COMMENTS — Cleanup Recommendations: Ecological / Recreational / Cultural Issues / Wildlife Observations

Sketch: Yes / No Photos: Yes / No (Roll #_____ Frames _____) Video Tape: Yes / No (Tape #_____)

Table 12-1 Example Shoreline Assessment Form Codes
(Source: NOAA)

SHORELINE ASSESSMENT FORM EXPLANATIONS

Calibration and consistency ARE VERY IMPORTANT! Do a calibration exercise to make sure that all teams are consistently using the same terminology and estimations.

Units: Use either metric (m, cm) or English (yd, ft, in). Circle the units used.

Tide Height: Circle the two letters indicating the progression of the tidal stage during the survey.

Sect. 3 SEGMENT SURVEY LENGTH

Always record both lengths on the first survey, especially where the team creates the segments in the field. On repeat surveys, always enter in the Survey Length, especially if only part of the segment is surveyed. Measure in meters or yards. If, applicable, GPS may be used to record ends of segments.

Sect. 6 SURFACE OILING CONDITIONS

Zone ID: Use a different ID for each different oil occurrence, e.g., two distinct bands of oil at mid-tide and high-tide levels, or alongshore where the oil distribution changes from 10% to 50%. Describe each different occurrence on a separate line.

Tidal Zone: Use the codes to indicate the location of the oil being described, as in the lower (LI), mid (MI), or upper (UI) intertidal zone, or in the supra (SU) tidal zone (above the normal high tide level).

Oil Distribution in tidal zones: Enter the estimated percent of oil on the surface, or codes for the following intervals:

C	Continuous	91–100% cover
B	Broken	51–90%
P	Patchy	11–50%
S	Sporadic	<1–10%
T	Trace	<1%

Figure 12-1 Example Shoreline Assessment Form Codes (continued)
(Source: NOAA)

Surface Oil Thickness: Use the following codes:

PO	Pooled Oil (fresh oil or mousse >0.4 in. (~1 cm) thick)
CV	Cover (oil or mousse from >0.04 in (0.1 cm) to <0.4 in. (~1 cm) on any surface)
CT	Coat (visible oil <0.1 in (0.1 cm), which can be scraped off with fingernail)
ST	Stain (visible oil, which cannot be scraped off with fingernail)
FL	Film (transparent or iridescent sheen or oily film)

Surface Oil Character

FR	Fresh Oil (unweathered, liquid oil)
MS	Mousse (emulsified oil occurring over broad areas)
TB	Tarballs (discrete accumulations of oil <10 cm in diameter)
TC	Tar (highly weathered oil, of tarry, nearly solid consistency)
SR	Surface Oil Residue (non-cohesive, oiled surface sediments)
AP	Asphalt Pavements (cohesive, heavily oiled surface sediments)
NO	No oil (no evidence of any type of oil)

SUBSURFACE OILING CONDITIONS

Oiled Interval: Measure the depths (from the sediment surface to top/bottom of subsurface oiled) layer. Enter multiple oil layers on separate lines.

Subsurface Oiling Descriptors: Use the following codes:

OP	Oil-Filled Pores (pore spaces are completely filled with oil)
PP	Partially Filled Pores (the oil does not flow out of the sediments when disturbed)
OR	Oil Residue (sediments are visibly oiled with black/brown coat or cover on the clasts, but little or no accumulation of oil within the pore spaces)
OF	Oil Film (sediments are lightly oiled with an oil film, or stain on the clasts)
TR	Trace (discontinuous film or spots of oil, or an odor or tackiness)

Sheen Color: Describe sheen on the water table as brown (B), rainbow (R), silver (S), or none (N).

Because the predominant grain size and substrate(s) in a section of oiled shoreline largely determine treatment methods, shoreline types are usually categorized in terms of their geologic character. The following shore types are used in this Manual as the basis for selecting treatment methods (Sections 12-3 and 12-4) (See also Table 6-1):

- Bedrock and wave-cut platforms
- Man-made solid structures and boulder beaches
- Fine-to-medium grain sand beaches
- Coarse-grain sand beaches
- Tundra cliffs
- Gravel and cobble beaches
- Riprap
- Exposed tidal flats
- Exposed vegetated tidal flats
- Sheltered rocky coasts and clay scarps
- Peat and lowland tundra
- Sheltered tidal flats
- Salt marshes and mangroves
- Sensitive near-shore and offshore habitats (coral reefs, lagoons, kelp beds, and seagrass beds)

12.3 Shoreline Treatment Decision Guides

Once a consensus is reached on the character of a shore and the nature of oiling, appropriate treatment methods can be selected. Figures 12-2 through 12-5 indicate potentially applicable treatment techniques, with the most preferred method listed first. If the first technique cannot be used, then the next one should be selected.

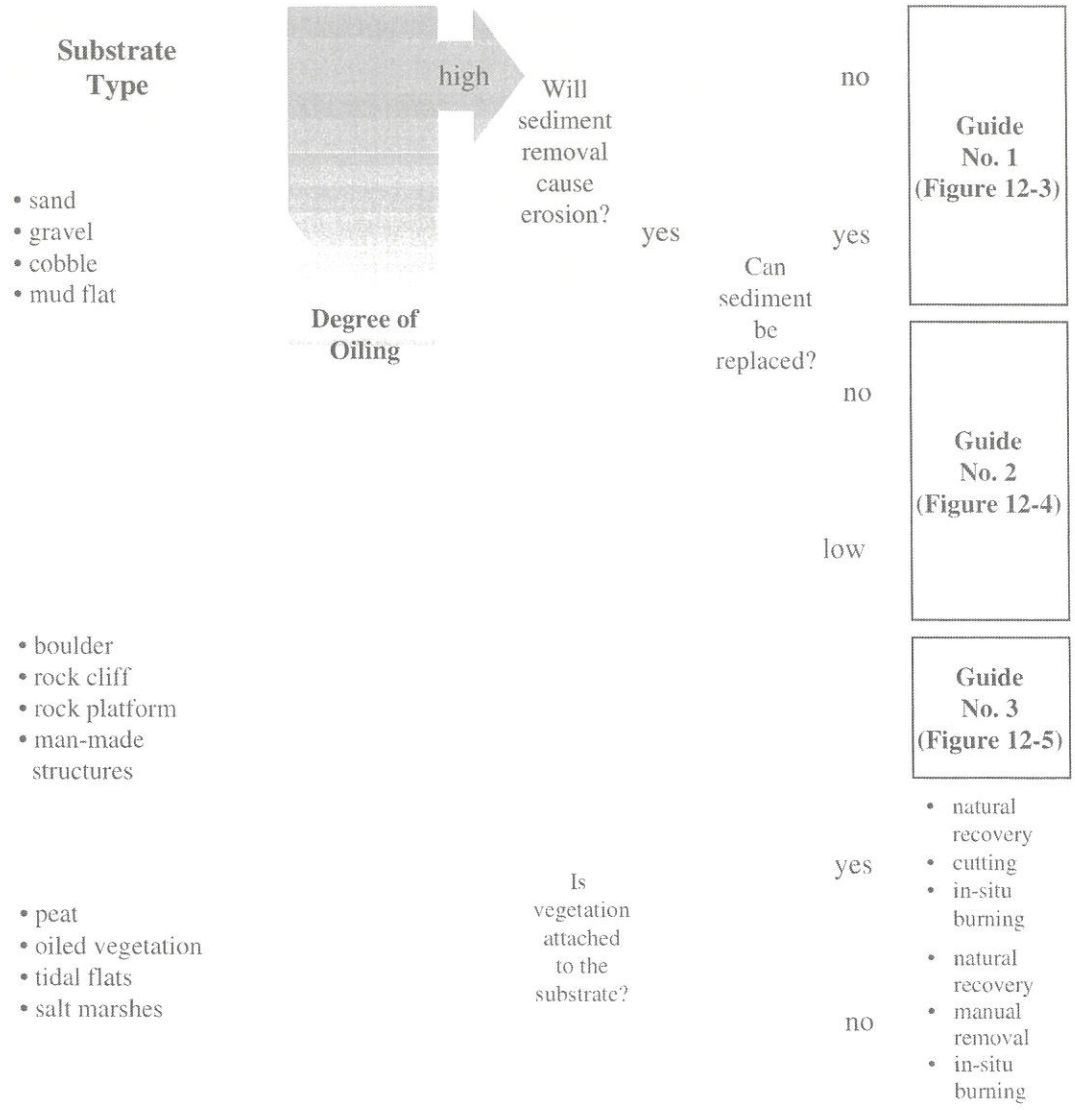

Figure 12-2 Shoreline Treatment Guide Key

12

Trafficability		Substrate Type	Oil Penetration	Cleanup Technique in Order of Preference	Access		
Can rubber-tired equipment operate on the beach?	yes	• sand • gravel • mud • cobble	<1 in (2.5 cm)	• motor grader and elevating scraper • elevating scraper • motor grader and front-end loader	Is there access to the beach for heavy equipment or can access be constructed?	yes	Select preferred technique
			>1 in (2.5 cm)	• elevating scraper • front-end loader • bulldozer and front-end loader			
no							
Can tracked equipment operate on the beach?	yes	• sand • gravel • mud • cobble	<10 in (25 cm)	• front-end loader • bulldozer and front-end loader			
no					no		
Use dragline or hydraulic grader or allow to recover naturally					**Guide No. 2 (Figure 12-4)**		

Figure 12-3 Shoreline Treatment Guide No. 1

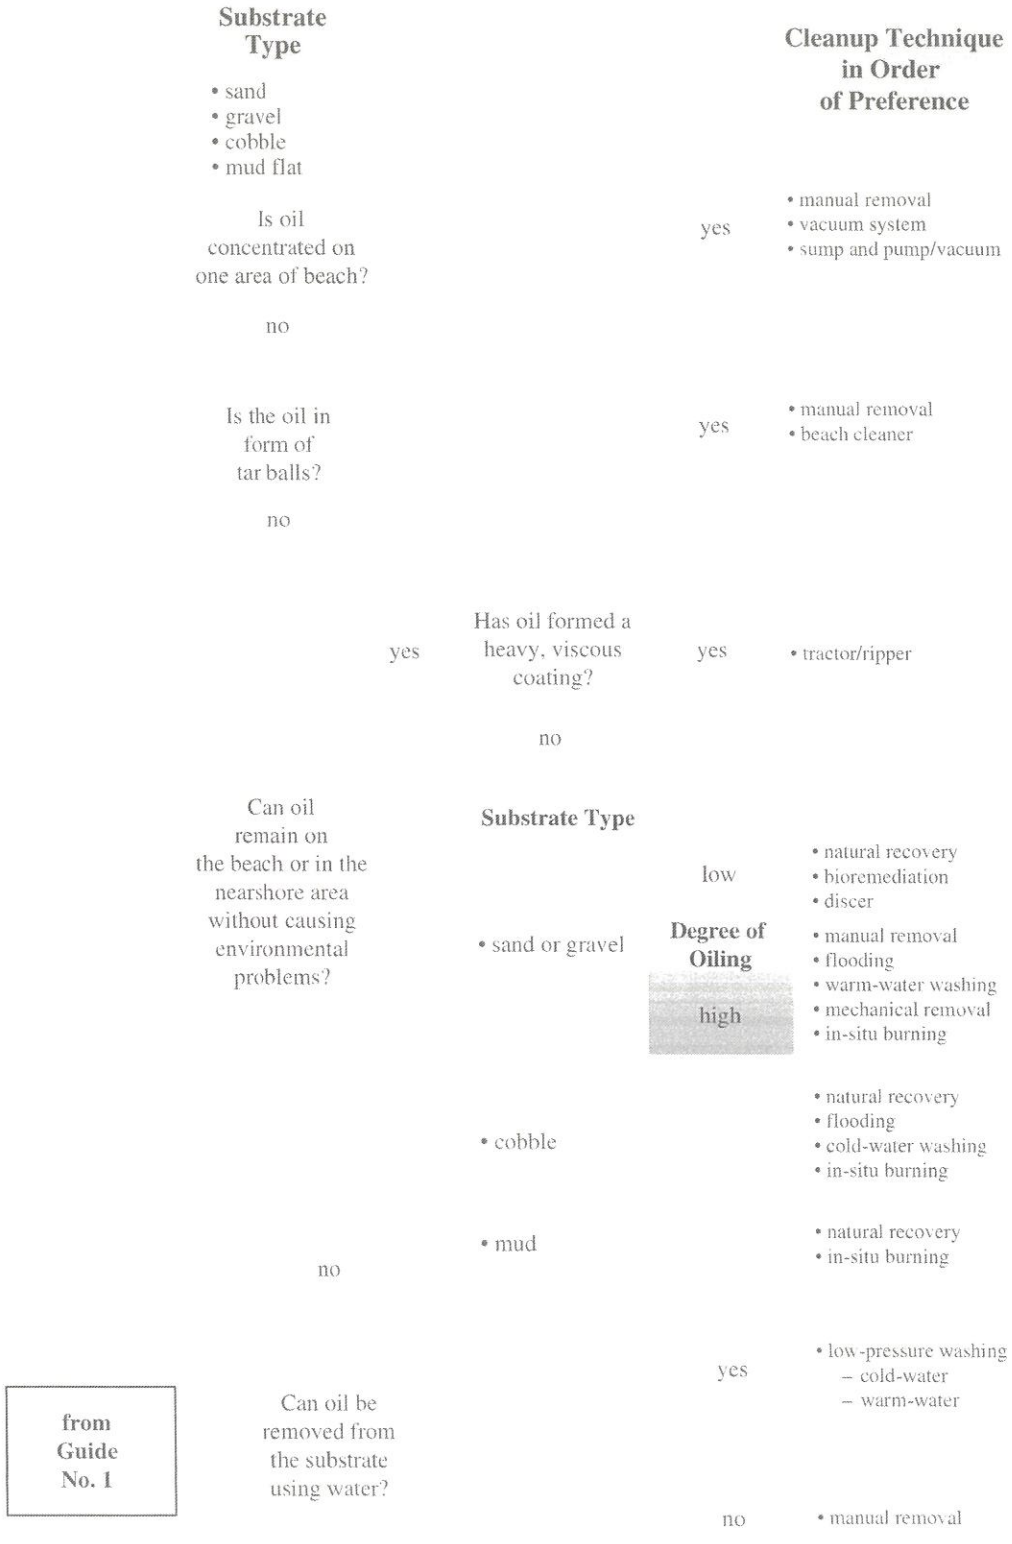

Figure 12-4 Shoreline Treatment Guide No. 2

Figure 12-5 Shoreline Treatment Guide No. 3

12.4 Treatment of Shoreline Types

Because many variables affect selection of treatment options, the decision-making process requires insights not provided in the Decision Guides. Table 12-2 supplements the Decision Guides by summarizing treatment options according to shoreline type. Further, note the following:

- Spray or flood from shore only when lower intertidal zones are under water.
- Do not spray freshwater on intertidal communities.
- Heat and hot water can affect organisms. Use with caution.
- Minimize foot traffic where organisms may be trampled.

Table 12-2 Treatment Options by Shore Type

Shore Type	Treatment Options
Exposed Rocky Headlands and Wave-Cut Platforms	• Natural recovery is preferred for light-medium oils that reach exposed coasts. Stranded, light oil may be rapidly removed by wave action. Light oil in sheltered areas is often removed by waves within weeks. Heavy oil can collect in hollows and be present for a significant time if not removed. • Vacuums are effective for light, medium and heavy oils that collect in tidal pools and hollows (unsafe for gasoline). • Flooding with water from a perforated pipe or hose without a nozzle is appropriate for light oils. Prevent oil flow downslope into lower intertidal zone. • Low-pressure, cold-water washing can also be used on light-medium oils. Washing from a boat or barge eliminates effects on organisms from foot traffic. Prevent oil flow downslope into lower intertidal zone. Contain and collect oil using booms and skimmers or sorbents. • Use high-pressure, cold-water washing on viscous oils that cannot be removed by low-pressure washing. • Manually remove small amounts of medium-heavy oils. Use low-pressure, warm/hot water wash on more viscous oils that cannot be removed by cold water. • Shoreline cleaners and chemicals may be used prior to flooding or low-pressure washing. Contain and collect recovered oil. • For steep cliffs, specially-designed omni-booms are the safest means of washing off oil.

Table 12-2 Treatment Options by Shore Type (continued)

Shore Type	Treatment Options
Man-Made Solid Structures and Boulder Beaches	• Natural recovery is preferred for light-medium oils that reach exposed coasts. Stranded, light oil may be rapidly removed by wave action, although heavy oil can persist for some time and may collect in hollows. Light oil in sheltered areas is often removed by waves within weeks. • Manually remove small amounts of medium-heavy oils. • Apply dispersants or other cleaning agents on small amounts of oil during flooding tide in countries that approve this procedure. • Flooding from a perforated pipe or a hose without a nozzle is appropriate for light oils. Do not allow oil to flow downslope into lower intertidal zone. • Low-pressure, cold-water washing can also be useful for light-medium oils. Washing from a boat or barge eliminates effects on organisms from foot traffic. Do not allow oil to flow downslope into lower intertidal zone. Contain and collect oil using booms and skimmers or sorbents. • Low-pressure, warm/hot water washing can remove more viscous oils that are not affected by cold water. • Use high-pressure, cold-water washing on more viscous oils that cannot be removed by low-pressure washing. • Use high-pressure, warm/hot water washing, steam cleaning, or sandblasting for surfaces where no organisms are present. • High-pressure, warm/hot water washing may remove viscous oil from stonework and plaster. Do not use abrasives (e.g., sandblasting) or chemicals on these surface types if damage might result. Consult government agencies when cleaning historic structures.

Table 12-2 Treatment Options by Shore Type (continued)

Shore Type	Treatment Options
Fine- to Medium-Grained Sand Beaches	• Natural recovery is preferred for small spills of light-medium oils on exposed or remote coasts. • Tilling/aeration or sediment relocation accelerates degradation and natural removal of light oils. • Mechanical removal is appropriate for long sections of beach with high concentrations of surface oil, provided that the operation can limit the removal of non-contaminated material. Graders and elevated scrapers are preferred since they can scrape a thin layer of oiled sand. Front-end loaders are less accurate, but can remove windrows made with graders. Bulldozers should be used as a last resort. Fine sand beaches are harder and provide better traction for vehicles. Traction is worse in the lower intertidal zone due to water-saturated sediments and above the normal intertidal area due to soft, wind-blown sediments. Reduced tire pressure can improve traction. Avoid excessive removal of sediment. • Manual removal is preferred for medium-heavy oils, but is less effective where oil is buried or reworked into sediments. Straight-edged shovels work better than pointed shovels. Front-end loaders can improve the efficiency of manual removal. • Flooding from a perforated pipe or a hose without a nozzle can remove light-medium oils on the surface but is ineffective if oils have penetrated below the surface. Flood oil into lined trenches or sumps and collect with skimmers or vacuum units. • Use low-pressure, cold-water washing on light-medium oils where penetration is not too deep and direct the liquid into lined trenches. Collect oil using vacuum units or skimmers. • Skimmers in boomed areas adjacent to a shoreline being cleaned can also collect washed oil. However, currents, waves, water depth, and the amount of debris may limit this approach.

Table 12-2 Treatment Options by Shore Type (continued)

Shore Type	Treatment Options
Coarse-Grained Sand Beaches	• Natural recovery may be acceptable for small spills, light-medium oils, or on exposed or remote coasts. • Mechanical removal is appropriate using graders or scrapers only if large amounts of heavy-to-solid oil can be recovered. Due to poor bearing capacity, use front-end loader with backhoe only as second choice. • Natural replacement of coarse sediment is very slow so removal of oiled material may require replacement to prevent shoreline retreat. Obtain advice from a coastal geomorphologist regarding the appropriate quantity of sediment that can be removed. • Flooding from a perforated pipe or a hose without a nozzle can remove light-medium surface oils but is ineffective if oil has penetrated into underlying sediments. Flood oil into lined trenches or sumps and collect the oil with skimmers or vacuum units. • Low-pressure, cold-water washing can be applied to light-medium oils. This removes mobile oil from surface and subsurface sediments, which is more effective than flooding. Contain oil in lined trenches and collect the oil using vacuum systems. • Avoid using warm-water washing or flooding on viscous oils. Heating can reduce oil viscosity, resulting in deeper oil penetration into the beach. • Skimmers in boomed areas adjacent to the shoreline being cleaned can also collect washed oil. However, currents, waves, water depth, and the amount of debris present may limit this approach.

Table 12-2 Treatment Options by Shore Type (continued)

Shore Type	Treatment Options
Tundra Cliffs	• Oil will most likely be naturally removed within a very short time. • Manual removal of oil or oiled tundra at the base of a cliff is only practical for a small amount of material. • Mechanical options are not advisable because they can accelerate erosion. • Natural peats are common and can be used as a sorbent, provided they do not come from the living tundra. • Vacuuming may be applicable for oil that has pooled. • Flooding can accelerate flushing of light oils from the beach sediment or from peat. • Aggressive treatments, such as high-pressure washing, hot-water washing, or burning are not appropriate.
Gravel and Cobble Beaches	• Natural recovery is preferred for small spills of light-to-medium oils on exposed or remote coasts. • Manually remove surface oiled sediments, asphalt pavement, tar patties, small oiled debris. Pointed shovels work best. • Flooding using water from a perforated pipe or a hose without a nozzle can remove light-medium oils but is ineffective on oils that have penetrated into underlying sediments. Direct oil into lined trenches or sumps and collect the oil with skimmers or vacuums. • Low-pressure, cold-water washing also can be used to direct oil into lined trenches. This is more effective in removing viscous oils from surface and subsurface sediments than flooding. • Avoid using warm-water washing or flooding on viscous oils. Heating can reduce oil viscosity resulting in deeper oil penetration into the beach. • Skimmers in boomed areas adjacent to the shoreline being cleaned can also collect washed oil. However, currents, waves, water depth, and the amount of debris present may limit this approach. • Before removing gravel or cobble, obtain advice from a coastal geomorphologist regarding the appropriate quantity of sediment that can be removed, if any. • For steep cliffs, specially-designed omni-booms are the safest means of washing off oil.

Table 12-2 Treatment Options by Shore Type (continued)

Shore Type	Treatment Options
Riprap	• Natural recovery is preferred for lighter oils and more exposed settings. • Manual removal of debris and small persistent oil pockets. • Early use of vacuum on pooled oil in crevices can increase the oil recovery rate. • High pressure/temperature washing may be needed to flush out viscous oils.
Exposed Tidal Flats	• Natural recovery is preferred for all oil types since response activities can cause more impacts than the oiling of the shore. • Mechanical removal is not an option since the poor bearing capacity of tidal flats to support personnel and machinery causes difficulties for treatment operations. Operations may be staged from a barge or flat-bottomed boat, which can ground at low tide and be refloated at high water. Care should be taken not to disturb sediment. • Vacuum systems are useful for small amounts of pooled light-to-medium oil (unsafe for gasoline). Trenches may capture oil during ebb tide. • Manually remove small amounts of pooled oil. • Flooding can be used for low-medium viscosity oil with sorbent for collection. • Low-pressure, cold-water washing can be used on light-medium oils. Contain oil in lined trenches and recover with vacuum unit or skimmer.

Table 12-2 Treatment Options by Shore Type (continued)

Shore Type	Treatment Options
Exposed Vegetated Tidal Flats	• Natural recovery is preferred for small spills of light-to-medium oils on exposed or remote coasts. • Manual removal of surface oiled sediments, asphalt pavement, tar patties, and small, oily debris is possible where the bearing capacity allows. • Flooding from a perforated pipe or a hose without a nozzle can remove light-medium oils, but is ineffective on oils that have penetrated into underlying sediments. Flood oil into lined trenches or sumps and collect it with skimmers or vacuum systems. • Methods of trapping or containing oil (trenches and ditches) for collection on a falling (ebb) tide may be effective. • Low-pressure, cold-water washing is more effective in removing viscous oils from surface and subsurface sediments than flooding. Wash oil into lined trenches. • Avoid using warm-water flooding or washing on viscous oils. Heating can reduce oil viscosity resulting in deeper oil penetration into the beach. • Manual removal with hand tools can be combined with vacuum systems and skimmers. • In situations where tidal flats do not support personnel or equipment, low-pressure, cold-water washing may be used at high tide to herd light-medium oil into boomed areas. Recover using either drum, disc, and rope mop skimmers, or sorbents for small amounts of oil. • Cutting vegetation can delay recovery, but may be advisable when migratory or nesting birds are at risk. Cutting affects plant re-growth and survival least during fall and winter. Consult ecology experts for advise.

Table 12-2 Treatment Options by Shore Type (continued)

Shore Type	Treatment Options
Sheltered Rocky Shores and Clay Scarps	• Natural recovery is preferred for light-medium oils that reach sheltered rocky shores. Stranded, light oil may be removed by wave action within weeks, although heavy oil can persist for years and may collect in hollows or burrows. Manual removal of small amounts of medium-heavy oils is usually possible. • Vacuum systems are effective for light, medium and heavy oils that collect in tidal pools and hollows (unsafe for gasoline). • Flooding from a perforated pipe or a hose without a nozzle is appropriate for light oils. Do not allow oil to flow downslope into lower intertidal zone. • Low-pressure, cold-water washing can also be useful for light-medium oils. Washing from a boat or barge eliminates impacts to organisms from foot traffic. Prevent oil flow downslope into lower intertidal zone. Contain and collect the oil using booms and skimmers or sorbents. • Low-pressure, warm/hot water washing is appropriate on more viscous oils that cannot be removed by cold water. • High-pressure, cold-water washing can be used on viscous oils that cannot be removed by low-pressure washing. • High-pressure, warm/hot water washing, steam cleaning, or sandblasting are effective and appropriate on surfaces where no organisms are present. • Chemical shoreline cleaners may be applied to small amounts of oil during flooding tide where there is sufficient circulation. Sorbents can be used to collect the freed oil. • For steep cliffs, specially-designed omni-booms are the safest means of washing off oil.

Table 12-2 Treatment Options by Shore Type (continued)

Shore Type	Treatment Options
Peat	• Natural recovery may be the preferred option. • Partial removal of heavily oiled peat may be beneficial. • Mechanical cleaning and aggressive removal are often not appropriate.
Inundated Lowland Tundra	• Natural recovery is preferred and has least impact for small to moderate spills. • Cleanup is warranted when large amounts of oil persist and act as a source of chronic re-oiling of adjacent sensitive habitats. • Sorbents, debris removal, and low-pressure flooding are the principal options to consider.
Sheltered Tidal Flats	• Natural recovery is preferred for all oil types since response activities can cause more impacts than shoreline oiling. • Flooding with water from a perforated pipe or a hose without a nozzle can remove light-medium oils but is ineffective if oil has penetrated to underlying sediment. Flood oil into lined trenches or sumps and collect with skimmers or vacuums. • Low-pressure, cold-water washing can be used on light-medium oils. Washing from a boat or barge eliminates impacts to organisms from foot traffic. Disc, drum and rope mop skimmers in boomed areas adjacent to the affected shoreline can collect washed oil.

Table 12-2 Treatment Options by Shore Type (continued)

Shore Type	Treatment Options
Salt Marshes and Mangroves	• The best protection is to spray with dispersants offshore before the oil can enter these habitats. • Natural recovery is generally preferred since treatment may disrupt the natural regenerative processes. But, since oil can affect the root systems of mangroves, a shoreline cleaner sprayed onto mangroves, which are covered with heavy oil, may reduce adhesion. (See Section 12.8) • Burning in salt marshes is one of the preferred treatment methods. Avoid burning when the lower stems are dry and exposed. • Intervention may be appropriate in marshes where oil has concentrated and may be widely spread with tidal action, where oil is a threat to wildlife, or when recovery may take decades (thick deposits of heavy oil). To avoid disruption of root systems by sediment removal or compaction from machinery and workers, work should be carried out from a boat. Road mats and low-pressure tires can reduce impacts when equipment must be moved on land. • In marshes and mangroves, low-pressure, cold-water washing may be used to herd light-medium surface oil into boomed areas. Recover oil using drum, disc and rope mop skimmers, or sorbents for small amounts of oil. Care should be taken to avoid excessive erosion. • Cutting oiled marsh plants can delay recovery, but may be advisable where migratory or nesting birds are at risk. Consult ecology experts for advice.

Table 12-2 Treatment Options by Shore Type (continued)

Shore Type	Treatment Options
Sensitive Near-shore and Offshore Habitats *Coral Reefs, Lagoons, Kelp Beds, Seagrass Beds*	• Dispersants can be used to protect coral reefs and associated nearshore kelp and seagrass beds when applied in waters >30 ft (10 m) or in areas with rapid natural dispersal. Their use minimizes cleanup vessel traffic. • In coral lagoons, removal of surface oil using booms and skimmers or vacuum units is advisable. • Navigating fringe coral reef areas is difficult and may preclude skimming, particularly when surface oil obscures sight of the coral. Natural recovery is preferred. • Low-pressure water streams can sometimes be used to direct oil floating above corals into booms for removal by skimmers or vacuum units. • Avoid in-situ burning and sinking agents directly above coral reefs, kelp, and seagrass beds. • Sorbents and manual removal methods should not be used on coral reefs.

12.5 Natural Recovery

Natural recovery is a treatment technique that allows a site to recover without intervention or intrusion. All shore types affected by small amounts of non-persistent oil can recover naturally, given appropriate circumstances. Assessment of the oiling (Section 12.2) and resources at risk is required to determine the likely consequences of allowing oil to weather naturally. Shorelines should be monitored to ensure that recovery occurs.

Natural recovery may be appropriate when:

- Oiling has occurred on high-energy beaches (primarily cobble, boulder and rock) where wave action will remove most of the oil in a relatively short time.
- Shorelines are remote or inaccessible.
- Treatment or cleaning of stranded oil may cause more damage than leaving the shore to recover naturally.
- Other response techniques either cannot accelerate natural recovery or are not practical.

Natural recovery may not be appropriate when:

- Important ecological resources or human activities/resources are threatened.
- Stranded oil might be remobilized and contaminate or re-oil adjacent resources or clean sections of shore.

Possible ramifications of natural recovery include:

- Sensitive areas may take considerable time to recover.
- The oil may adversely affect vegetation and organisms (smothering and/or toxicity).

12.6 Physical Treatment Techniques

Physical techniques are typically used to remove oil stranded in an intertidal zone when natural recovery is not an acceptable response strategy. In this section, a series of tables presents information on physical treatment options, including a brief description of each method, where it likely would be applied, its possible effects, and the logistical support required. Treatment rates and personnel requirements have been estimated based on the level of effort generally required to treat an area in an 8-hr day. Techniques have been arranged in approximate order of their likely environmental impact, beginning with the least intrusive:

- Four methods used by cleanup teams to manually remove oil from shores are described in Tables 12-3 through 12-6.
- Treatment techniques involving the application of water to remove oil from sediments and bedrock have been summarized in Tables 12-7 through 12-9.
- Steam cleaning and sandblasting, sometimes used to remove oil from hard surfaces, are described in Tables 12-10 and 12-11. Operators and nearby crew of such equipment need PPE, especially respiratory protection from any aerosols created during use.
- Vacuums, including truck-mounted and portable units (see also Section 11.4) used to remove oil pooled on shore, are listed in Tables 12-12 and 12-13.
- Heavy machinery, used singly and in combination when access and other circumstances allow, are detailed in Tables 12-14 through 12-23. In selected circumstances, draglines or clamshell dredges could be used to collect oiled sediment and debris.

Many types of mobile mechanical equipment use inflatable tires, whose pressure can influence the efficiency of operation. It is advisable to adjust tire pressures to suit shoreline conditions.

Table 12-3 Sorbent Application

Description

Sorbents are applied manually to soak up non-sticky oil stranded on shore. Pom-poms are positioned in the intertidal zone as a passive array to collect viscous (sticky) oil.

Application

Use on all shore types to remove small accumulations of oil.

Possible Adverse Effects

Foot traffic may disturb sediments and affect organisms. Birds and small mammals may ingest particulate sorbents if they are left uncollected.

Equipment	Quantity Required (per day)
Sorbent sheets	20 bales (100–200 pads/bale)
Sorbent rolls	20 rolls [36 in (90 cm) x 150 ft (45 m)/roll]
Sorbent boom	20 bales [4 ft (1.2 m) length x 8 in (20 cm) dia. x 10 ft (3 m)/bale]
Pom-poms (for viscous (sticky) oil)	10 bales (100/bale)
Pitchforks, rakes, etc.	10–20
6-mil (0.15 mm) plastic bags (white or light color)	10 cartons (40–50/carton)
Personnel	**Optimum Treatment Rate**
10–20 workers	Treatment rate is highly variable. Expect up to 1/4 gal (1 liter)/pad of oil recovery, depending on oil type.
1 foreman for every 10 workers	
Disposal	**Suggestion**
Pads and rolls	Disposal is facilitated by rolling up sorbent and placing it in suitable containers.
Boom	Disposal is accomplished by folding, rolling and/or stuffing the boom into plastic bags for removal.
Loose material	Loose sorbent materials are not recommended for use on oil on water or tidal shorelines due to difficulty in recovery for disposal.
Access	
Light motor vehicle, shallow craft or helicopter	

Table 12-4 Manual Removal of Oiled Materials

Description
Oiled sediment and debris are removed by hand, shovels, rakes, etc.

Application
Use on mud, sand, gravel, and cobble when oiling is light, sporadic, and/or at or near the beach surface, or on beaches where there is no access for heavy equipment.

Possible Adverse Effects
May disturb/remove sediment and shallow burrowing organisms.

Equipment	Number Required	
	Lightly Oiled Shoreline [~1.2 miles (2 km)]	**Heavily Oiled Shoreline [~1.2 miles (2 km)]**
Shovels, rakes, picks	10–20	50–100
Debris box or super sac	2	3–4
ATV[1] with trailers or wheelbarrows	1–2	1–2
Personnel	**Lightly Oiled Shoreline [~1.2 miles (2 km)]**	**Heavily Oiled Shoreline [~1.2 miles (2 km)]**
Workers	10–20	50–100
Foremen	1–2	5–10
Access		
Foot path, road, shallow craft or helicopter		

[1] ATV is an All Terrain Vehicle.

Table 12-5 Manual Scraping

Description

Oil is manually scraped from substrate using hand tools.

Application

Use on lightly oiled boulders, rocks, and man-made structures or heavy accumulations when other techniques are not allowed or are not practical.

Possible Adverse Effects

May disturb sediment and remove or injure organisms. Unremoved or unrecovered oil can injure organisms that are repopulating the rocky substrate or inhabiting sediment downslope of cleanup activities.

Equipment	Number per Crew
Paint scrapers	1 per worker (plus several extra to allow for loss of edge or breakage)
Sharpening tool (file/hone)	1
Rakes, shovels, trowels	1 each per worker
Plastic bags	75–100
Ground cover (for initially catching removed oil) such as: • Plastic film • Cloth • Sorbents	1–3 rolls
Personnel	**Optimum Treatment Rate**
5 crews of 10 workers each	The treatment rate is highly variable, depending on degree of oiling, type of substrate, and the number of non-oiled plants and animals to be protected.
1 foreman for each crew	
Access	
Foot path, shallow craft, or helicopter	

Table 12-6 Vegetation Cutting

Description

Oiled vegetation is cut by hand, collected, and put into bags or containers for disposal.

Application

Use on oiled vegetation.

Possible Adverse Effects

May disturb and remove sediment and organisms. Heavy foot traffic may cause root damage and delayed recovery. May cause erosion due to loss of vegetation.

Equipment	Number per Crew
Cutting tools such as: • Scythes • Power cutters • Shears	3–4 (plus 1 or 2 extra in case of breakage or dull blades)
Sharpening tool (file/hone)	1
Collecting tools such as: • Pitch forks • Rakes	4–6
Plastic bags	75–100
Ground cover such as: • Plastic film • Burlap • Sorbents	1–3 rolls
Personnel	**Optimum Treatment Rate**
5 crews of 10 workers each	Each crew can cut and bag about 77 yd^2/hr (65 m^2/hr) of vegetation on a heavily vegetated shoreline.
1 foreman for each crew	
Access	
Foot path, shallow craft or helicopter	

Table 12-7 Low Pressure, Cold-Water Washing

Description

Low-pressure water spray removes oil from substrate and channels it to recovery points. [Nozzle pressure is kept below 100 psi (690 kPa)].

Application

Use to wash oil from mud, cobble, boulder, rock, man-made structures, and vegetation.

Possible Adverse Effects

May create a potential for re-oiling and disturbance of organisms downslope of cleanup if oil is not contained and removed.

Primary Equipment	Type	Number
Washing unit (pump and hoses)	10–20 psi (70–140 kPa) pressure @ 50–100 gpm (190–380 L/min)	3–5
Vacuum system	110 barrel (17.5 m^3) capacity	1–2
Pump and tank truck	50–75 gpm (190–285 L/min), 125 barrel (20 m^3) capacity	1–2
Equipment to contain and recover loosened oil, if required	Boom and skimmer	
Personnel	**Optimum Treatment Rate**	
1–2 workers per washing or recovery unit; PPE required	The rate of treatment depends on the degree of oiling, type of oil and substrate and is difficult to forecast. (~220 gpm [50m^3/hr])	
1 foreman for every 10 workers; PPE required		
Access		
Road for heavy equipment, barge, or landing craft for trucks		
Light motor vehicle, shallow craft, or helicopter for washing unit		

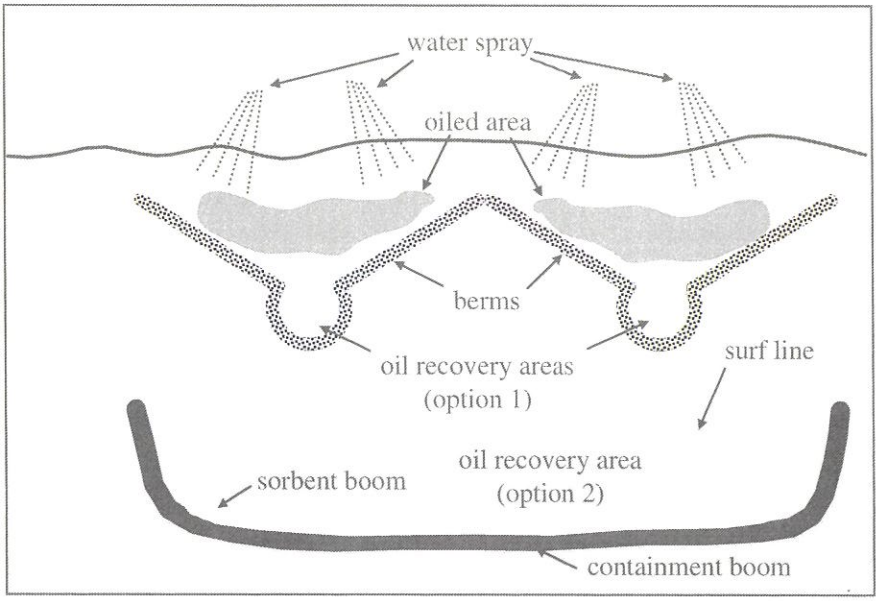

Figure 12-6 Low Pressure Flushing

Table 12-8 Low-Pressure, Warm-Water Washing/Cold-Water Flooding

Description

Heated seawater softens weathered oil; cold-water flooding moves the loosened oil to the adjacent water for collection. These two techniques can be used separately or together.

Application

Use on heavy concentrations of weathered, sticky oil that has reached sheltered or moderate energy shorelines composed of rock, cobble, and gravel.

Possible Adverse Effects

May injure intertidal organisms. High nozzle pressure can cause localized erosion.

Primary Equipment	Size of Unit	Quantity
Landing craft (or suitable trailers for land-based operations)	40–80 ft (12–24 m)	1
Direct-fired water heater	8 million BTU/hr (2340 kW) 125 gpm (475 L/min) @ 140°F (60°C)	2
Pumps	6 in (15 cm) @ 100 psi (690 kPa)	2
Generator	70 hp (50 kW)	1
Containment boom	inshore boom	600 ft (180 m)
Sorbent boom		300 ft (90 m)
Fire hoses/nozzles	1/2–1 in (1.25–2.5 cm)	4
Perforated flushing header, corrugated pipe	6 in (15 cm)	100 ft (30 m)
Manifold hose	6 in (15 cm)/4 in. (10 cm)	100 ft (30 m)
Snare boom/pom-poms		300 ft (90 m)
Support Equipment		
Water heater • Pump and generator • Landing craft		
Personnel	**Optimum Treatment Rate**	
2 crews of 10 workers each, 1 foreman for each crew; PPE required	The rate of treatment depends on the degree of oiling, type of oil and substrate, and is difficult to forecast. (~220 gpm [50m³/hr])	
Access		
Landing craft or road for heavy equipment, barge		

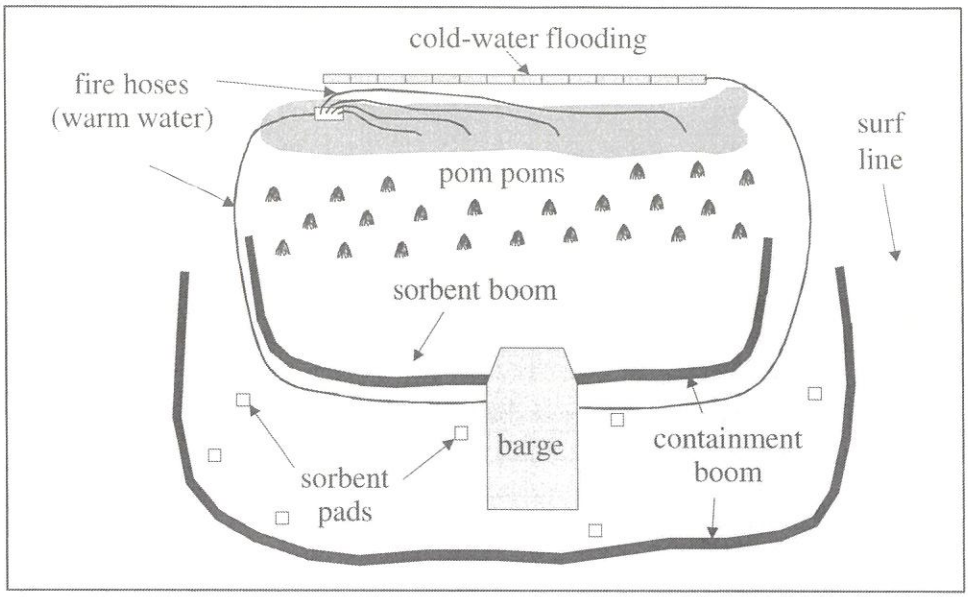

Figure 12-7 Low-Pressure, Warm-Water Washing/Cold-Water Flooding

Table 12-9 High-Pressure Washing

Description

High-pressure cold or warm water streams remove oil from substrate and channel it to a recovery area.

Application

Use to remove oil from boulder, rock, and man-made structures.

Possible Adverse Effects

May remove some organisms and shells from substrate. Can disturb substrate surface and wash oil into sub-surface sediments and downslope organisms.

Primary Equipment	Type	Number
Pressure washing unit	Self-contained 10 gpm (38 L/min) @ 4000 psi (27,000 kPa)	2–3
Equipment to contain and recover loosened oil, if required	Boom and skimmer	
Support Equipment	**Type**	**Number**
Vacuum system	60–80 barrel (9.5–13 m^3) capacity	1
Trash pump	25–50 gpm (95–190 L/min)	1
Tank truck	60–80 barrel (9.5–13 m^3) capacity	1
Personnel	**Optimum Treatment Rate**	
1–2 operators per pressure washing unit; PPE required	One unit that produces 3,000–4,000 psi (20,000–26,667 kPa) pressure can clean 7–15 ft^2 (0.75–1.5 m^2) per minute.	
1–2 workers per recovery equipment; PPE required		
1 foreman for every 10 workers; PPE required		
Access		
Road or barge for heavy equipment, trucks		
Light motor vehicle path, shallow craft, or helicopter for washer only		

Table 12-10 Steam Cleaning

Description

Steam removes oil from substrates and it is channeled to a recovery area.

Application

Use to remove oil coatings from man-made structures, boulders, and rock. Establish an exclusion zone.

Possible Adverse Effects

Removal of and mortality to some organisms are likely. Oil not recovered can affect organisms downslope of cleanup activities.

Primary Equipment	Size of Unit	Number Required	Optimum Treatment Rate
Steam cleaner	280 psi (1930 kPa) @ 325°F (163°C)	4–6	600 ft²/hr (55 m²/hr)
Vacuum truck	80–100 barrel (12.7–15.9 m³) capacity	1–2	
Skimmer	Small	1–2	
Containment boom	2–4 x length of shoreline cleaned	2	

Consumables	Fresh Water Consumption/Unit
Steam cleaner	3.8–4.3 gpm (14–16 L/min)

Personnel
2 operators for each cleaning unit; PPE required
1 foreman for every 10 workers; PPE required

Access
Road for heavy equipment, trucks
Light motor vehicle path, shallow craft, or helicopter for steam cleaning units

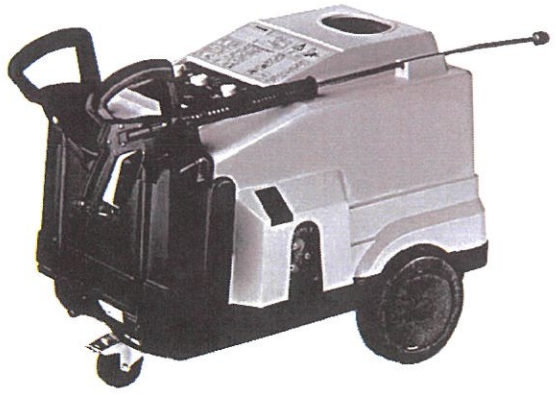

Figure 12-8 Steam Cleaner

Table 12-11 Sandblasting

Description

Sand moving at high velocity removes oil from a substrate.

Application

Use to remove thin oil residue from man-made structures and other hard surfaces. Establish an exclusion zone.

Possible Adverse Effects

May remove organisms and shells from a substrate and leave behind a clean, barren surface. Can affect downslope organisms. Adds sand to environment, along with potential re-oiling, erosion, and deeper oil penetration.

Primary Equipment	Number Required	Optimum Treatment Rate
Sandblasting unit (compressor included)	1	150 ft²/hr (14 m²/hr)
Sand supply truck	1	
Front-end loader (if used)	1	
Consumables	**Amount**	**Optimum Treatment Rate**
Sand	Approx. 1000 lb/hr (455 kg/hr)	150 ft²/hr (14 m²/hr)
Ground cover	1–3 rolls	
Personnel	**Number Required**	**Optimum Treatment Rate**
Workers for sandblasting	2–4; PPE required	150 ft²/hr (14 m²/hr)
Cleanup workers	2–3; PPE required	
Foreman	1; PPE required	
Access		
Road for heavy equipment, barge or landing craft		

Figure 12-9 Sand Blaster

Table 12-12 Vacuum Systems

Description

Truck or portable vacuum unit is positioned near oil pool or recovery site where oil is collected via vacuum hose.

Application

Use to remove oil accumulations on water in the absence of skimmers and to recover oil pooled in natural depressions on all shoreline types (except inaccessible vegetated or other areas). Unsafe for recovery of gasoline.

Possible Adverse Effects

May remove some organisms. Watch for collection of vapors.

Primary Equipment	Typical Suction Rate for Pooled Oil	Typical Suction Rate for Oil on Water	Typical Fill Time for 110-bbl (17.5 m^3) Tank
Vacuum unit[1] with 2–3 in (5–7.5 cm) suction hose and skimming head	50–100 gpm (190–380 L/min) (75% oil)	25–50 gpm (95–190 L/min) (5% oil)	0.75 hr @ 100 gpm (380 L/min) 1.5 hr @ 50 gpm (190 L/min) 3 hrs @ 25 gpm (90 L/min)

Range of Capacities	
Vacuum system	6–140 barrels (0.9 m^3–22.3 m^3)
6 in (15 cm) suction hose	700–900 gpm (2650–3400 L/min) maximum[2]
4 in (10 cm) suction hose	500–600 gpm (1900–2270 L/min) maximum[2]
3 in (7.5 cm) suction hose	50–400 gpm (190–1510 L/min) maximum[2]
2 in (5 cm) suction hose	50–200 gpm (190–760 L/min) maximum[2]

Support Equipment

Devices for herding oil on water can include:

- Boom
- Skimming boards
- Low-pressure water hoses
- Leaf blowers/air movers

Personnel

1 worker per suction hose

1–2 workers for containing, herding and manual skimming of oil

1 foreman for every 10 workers

Access

Road for heavy equipment, barge or landing craft

[1] Number of vacuum units required is dependent on the quantity of oil, the number of recovery sites, and the oil-to-water ratio.

[2] Intake is completely submerged, drawing fluid with little or no suction lift.

Table 12-13 Sump Pump/Vacuum System

Description

Oil flows into and collects in a sump where it is removed by pump or vacuum unit.

Application

Use on firm sand or mud beaches that are being continuously oiled.

Possible Adverse Effects

May cause removal of organisms due to excavation of 2–4 ft (0.6–1.2 m) sump. Watch for collection of vapors.

Primary Equipment	Typical Suction Rate for Thick Oil [0.08 in (2 mm)]	Typical Suction Rate for Thin Oil [0.04 in (1 mm)]	Typical Fill Time for 110-bbl (17.5 m^3) Tank
Vacuum unit[1] or high capacity pump typically with 2–3 in (5–7.5 cm) suction hose and skimming head	75 gpm (285 L/min) 50 gpm (190 L/min) (50% oil)	50 gpm (190 L/min) 25 gpm (95 L/min) (5% oil)	1 hr @ 75 gpm (285 L/min) 1.5 hr @ 50 gpm (190 L/min)

Range of Capacities	
Vacuum unit	6–140 barrels (0.9 m^3–22.3 m^3)
Tank truck	20–160 barrels (3.2 m^3–25.4 m^3)
6 in (15 cm) suction hose	700–900 gpm (2650–3400 L/min) maximum[2]
4 in (10 cm) suction hose	500–600 gpm (1900–2270 L/min) maximum[2]
3 in (7.5 cm) suction hose	50–400 gpm (190–1510 L/min) maximum[2]
2 in (5 cm) suction hose	50–200 gpm (190–760 L/min) maximum[2]

Personnel
1 worker per suction hose
1–2 workers for containing, herding and manual skimming of oil
1 foreman for every 10 workers

Access
Road for heavy equipment, barge or landing craft

[1] Number of vacuum units or pumps required is dependent on the quantity and collection rate of oil in the sump.

[2] Intake is completely submerged, drawing water with little or no suction lift.

Table 12-14 Beach Cleaner

Description
Pulled by tractor or self-propelled across a beach picking up tar balls or patties.

Application
Use on lightly oiled (tar balls or patties) sand or gravel beaches.

Possible Adverse Effects
May disturb upper sediments and shallow-burrowing organisms.

Primary Equipment	Number	Optimum Treatment Rate
Operated at 4 mph (6.4 km/hr)	1	25 min/acre (1 hr/hectare)
taking a skim cut 6 ft (1.8 m) wide Operated at 1 mph (1.6 km/hr) taking a deep cut 6 ft (1.8 m) wide	1	1.4 hr/acre (3.5 hr/hectare)
Support Equipment		
Tractor (rubber-tired)		
Personnel		
1 operator for each piece of equipment		
Access		
Road for heavy equipment, barge, or landing craft		

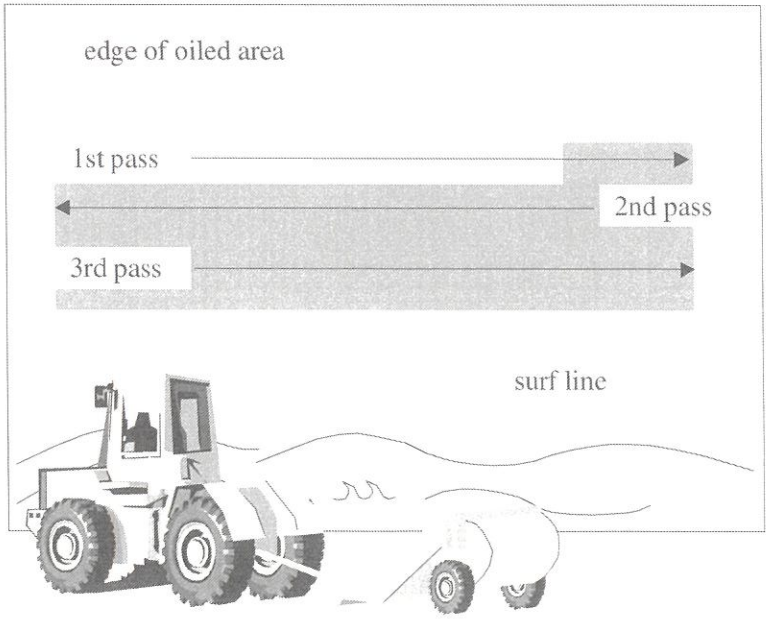

Figure 12-10 Beach Cleaner Treatment Pattern

Table 12-15 Heavily Oiled Sediment Mixing-Tractor/Ripper

Description

Tractor fitted with either a ripper or tines is operated up and down beach (so sediments remain and erosion is minimized) to promote evaporation and weathering by shoreline processes.

Application

Use on heavy surface oiling ("pavement") on cobble, gravel, and sand beaches. Use on low amenity beaches. Use where substrate removal would cause erosion.

Possible Adverse Effects

May disturb sediments and both shallow- and deep-burrowing organisms.

Primary Equipment	Number Required	
	66 ft (20 m) x 1.2 mi (2 km) Area	165 ft (50 m) x 1.2 mi (2 km) Area
Tractor/ripper	1	2

Personnel	Optimum Treatment Rate
1 operator for each piece of equipment	Machine operating at 1.5 mph (2.4 km/hr) can rip a 10 ft (3 m) swath at 1.8 acres/hr (7280 m²/hr). About 1.2 mi (2 km) of beach can be cleaned per day.

Access
Road for heavy equipment, barge or landing craft

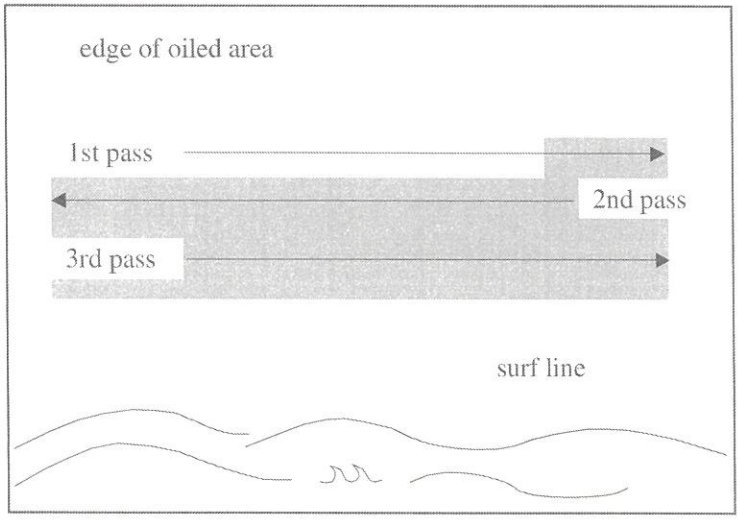

Figure 12-11 Tractor/Ripper Treatment Pattern

Table 12-16 Lightly Oiled Sediment Mixing-Discer

Description
Tractor pulls discing equipment along an oiled area to promote evaporation and weathering by shoreline processes.

Application
Use on lightly oiled, non-recreational sand and gravel beaches.

Possible Adverse Effects
May disturb surface substrate and shallow-burrowing organisms.

Primary Equipment	Number Required	Optimum Treatment Rate
Tractor (track-type preferred, Rubber-tired 2nd choice) and:	1	
8 ft (2.4 m) wide discer 12 ft. (3.6 m) wide discer	1 1	0.3–0.4 hr/acre (0.75–1 hr/hectare) 0.2–0.3 hr/acre (0.5–.75 hr/hectare)
Personnel		
1 operator for each piece of equipment		
Access		
Road for heavy equipment, barge or landing craft		

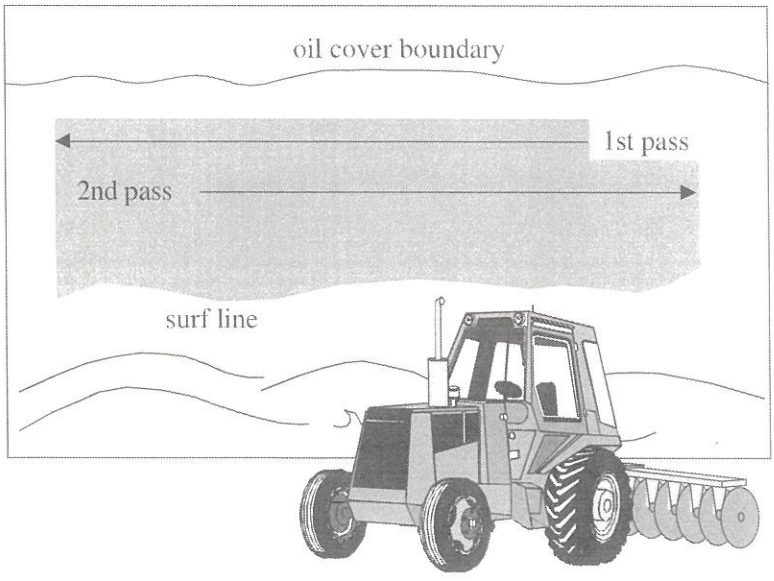

Figure 12-12 Discer Treatment Pattern

Table 12-17 Surf Washing–Bulldozer

Description

Mechanical equipment pushes oiled substrate into the surf zone to accelerate natural cleaning while causing minimal erosion.

Application

Use on level gravel and cobble beaches or firm sand where erosion of beach or backshore area is a concern.

Possible Adverse Effects

Leaves oil in the intertidal zone (re-oiling is possible) and may disrupt the top layer of substrate. Because of a less accurate depth of cut and pushing of sediments, considerable mixing of sediments is likely.

Primary Equipment	Number Required		Optimum Treatment Rate
	66 ft (20 m) wide oiled zone	165 ft (50 m) wide oiled zone	
Bulldozer	2	5	264 ft (80 m) shoreline/hr

Personnel	Optimum Treatment Rate
1 operator for each piece of equipment	Each bulldozer covers about 5 hr/acre (12.5 hr/hectare)

Access
Road for heavy equipment, barge, or landing craft

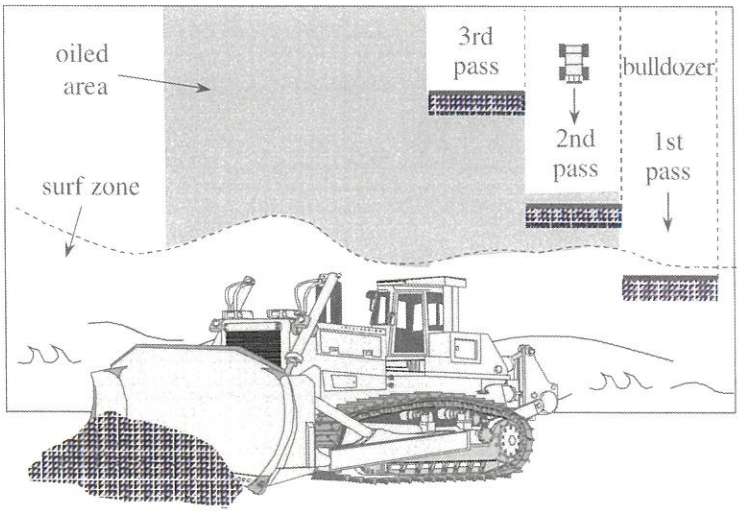

Figure 12-13 Bulldozer Treatment Pattern

Table 12-18 Mechanical Surface Cleaner–Elevating Scraper

Description

Elevating scraper collects oiled material directly off a beach.

Application

Use to remove surface oil, tar balls, and patties on sand and gravel beaches.

Possible Adverse Effects

May cause disturbance of upper sediments (<1 in/2.5 cm) and shallow- and deep-burrowing organisms. Minor reduction of beach stability may lead to erosion and beach retreat.

Primary Equipment (elevating scraper)	Number Required		Optimum Treatment Rate
	500 ft (150 m) Haul Distance	2,000 ft (600 m) Haul Distance	
20 yd^3 (15 m^3) Holding capacity	2	4	1.2–1.4 hr/acre (3–3.5 hr/hectare)
10 yd^3 (7.5 m^3) Holding capacity	4	8	
Estimated Maximum Hourly Waste Generation			
Approx. 100 yd^3 (76 m^3) with a 6 in (15 cm) cut			
Personnel			
1 operator for each piece of equipment			
Access			
Road for heavy equipment, barge or landing craft			

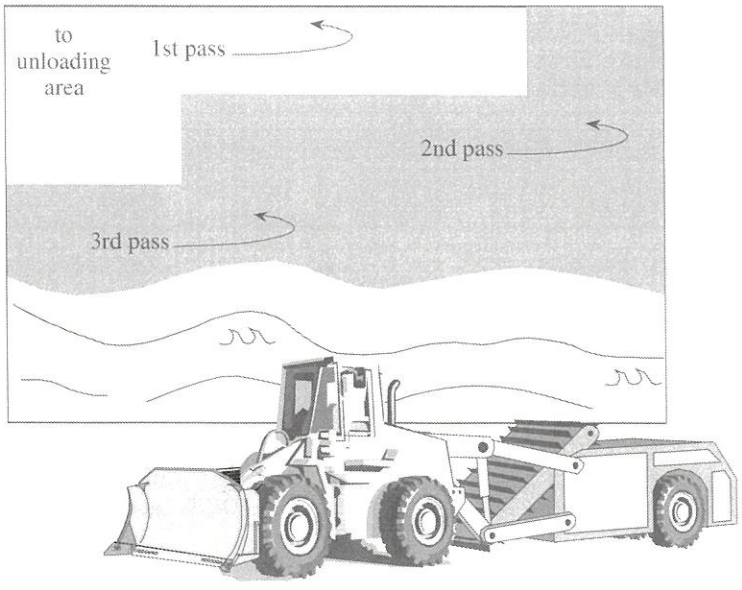

Figure 12-14 Elevating Scraper Treatment Pattern

Table 12-19 Mechanical Sediment Removal — Motor Grader/Elevating Scraper Combination

Description
Motor grader forms windrows for collection by an elevating scraper.

Application
Use to remove surface oil on hard-packed sand with good trafficability.

Possible Adverse Effects
May cause disturbance of upper beach sediments (up to 6 in (15 cm) or greater) and shallow-burrowing organisms. May remove clean material.

Primary Equipment	Number Required		Optimum Treatment Rate
	500 ft (150 m) Haul Distance	2,000 ft (600 m) Haul Distance	
Motor grader and:	1	1	—
Elevating scraper: 20 yd^3 (15 m^3) Holding capacity	2	4	1.2–1.4 hr/acre (3 to 3.5 hr/hectare)
10 yd^3 (7.5 m^3) Holding capacity	4	8	
Estimated Maximum Hourly Waste Generation			
Approx. 620 yd^3 (475 m^3) with a 6 in (15 cm) cut			
Personnel			
1 operator for each piece of equipment			
Access			
Road for heavy equipment, barge or landing craft			

Note: Spillage from graders can increase when multiple passes are made to side-cast oiled sediments.

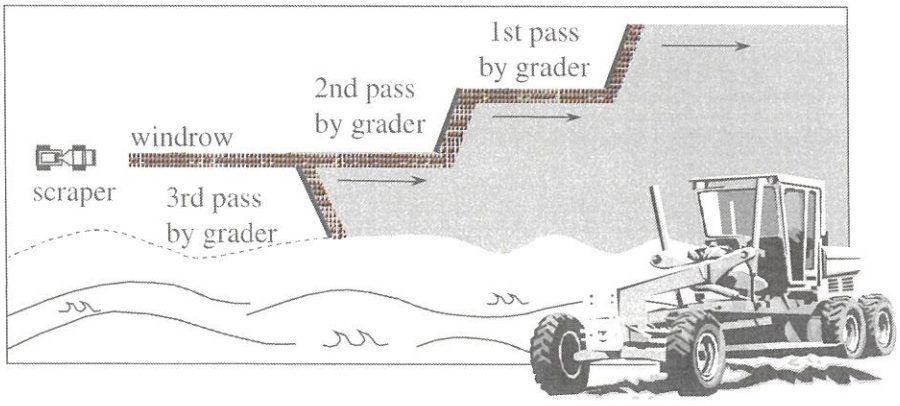

Figure 12-15 Motor Grader/Elevating Scraper Combination Treatment Pattern

Table 12-20 Mechanical Sediment Removal–Front-End Loader

Description

Front-end loader collects material directly off a beach and hauls it to an unloading area. 1st choice: rubber-tired loaders, 2nd choice: track-type loaders

Application

Use on light-to-moderately oiled firm mud, firm sand, gravel, and (especially) cobble beaches where oil penetration exceeds 1 in (2.5 cm) and on extensively oiled vegetation. Depth of cut is ~ 6 in (15 cm).

Possible Adverse Effects

May remove sediment and shallow- and deep-burrowing organisms. Reduction of beach stability may lead to beach erosion and retreat.

Primary Equipment	Number Required		Optimum Treatment Rate [3 yd^3 (2.2 m^3) bucket 2/3 full]
	100 ft (30 m) Haul Distance	500 ft (150 m) Haul Distance	
Front-end loader (rubber-tired: preferred)	2	4	3.2–3.4 hr/acre (8–8.5 hr/hectare)
Front-end loader (track-type: 2nd choice)	2	6	4.4–4.6 hr/acre (11–11.5 hr/hectare)
Support Equipment	**Optimum Number of Truck Loads/Hr**		**Optimum Treatment Rate**
	10 yd^3 (7.5 m^3)	**20 yd^3 (15 m^3)**	
Dump trucks	20	10	3.6 hr/acre (9 hr/hectare) and 850 yd^3/acre (1521 m^3/hectare)
Estimated Maximum Hourly Waste Generation			
Approx. 180–240 yd^3 (140–180 m^3) with a 6 in (15 cm) cut			
Personnel			
1 operator for each piece of equipment			
Access			
Road for heavy equipment, barge or landing craft			

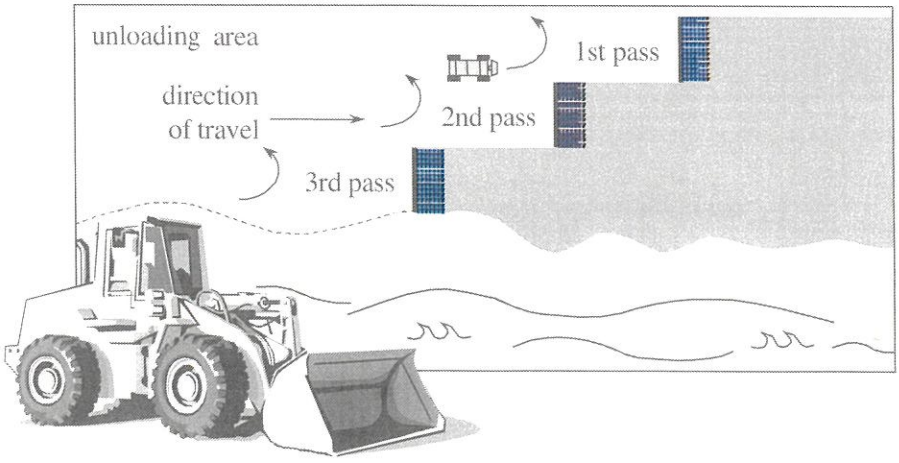

Figure 12-16 Front-End Loader Treatment Pattern

Table 12-21 Mechanical Sediment Removal–Motor Grader/Front-End Loader Combination

Description

Motor grader forms windrows for pickup by a front-end loader.

Application

Use to remove surface oil from hard-packed sand beaches.

Possible Adverse Effects

May remove shallow-burrowing organisms. May remove clean material up to 6 in (15 cm) or greater.

Primary Equipment	Number Required		Optimum Treatment Rate [3 yd^3 (2.2 m^3) bucket 2/3 full]
	500 ft (150 m) Haul Distance	2000 ft (600 m) Haul Distance	
Motor grader and:	1	1	—
Front-end loader (rubber-tired)	2	4	1.3–1.5 hr/acre (3.25–3.75 hr/hectare)
Front-end loader (track-type)	4	6	1.6–1.8 hr/acre (4–4.5 hr/hectare)
Support Equipment	**Optimum Number of Truck Loads/Hr**		**Optimum Treatment Rate**
	10 yd^3 (7.5 m^3)	**20 yd^3 (15 m^3)**

1 operator for each piece of equipment			
Access			
Road for heavy equipment, barge or landing craft			

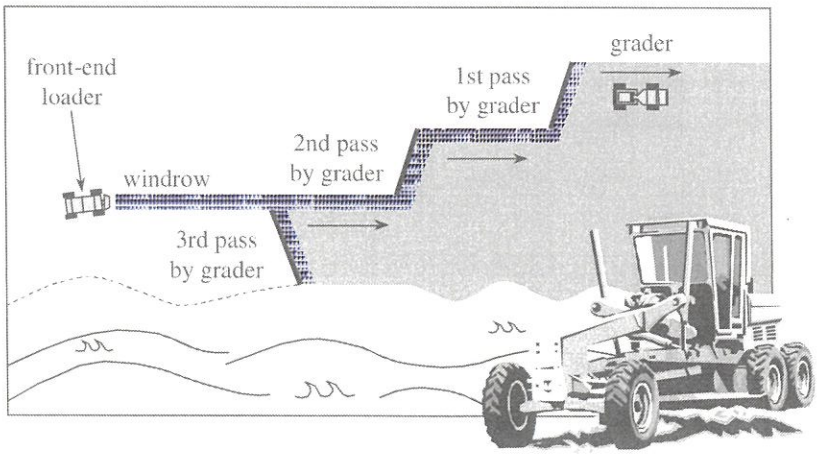

Figure 12-17 Motor Grader/Front-End Loader Combination Treatment Pattern

Table 12-22 Mechanical Sediment Removal–Bulldozer/Front-End Loader (Rubber-Tired) Combination

Description

Bulldozer pushes oiled substrate into piles for pickup by front-end loader.

Application

Use on level, heavily oiled coarse sand, gravel, and cobble beaches with poor trafficability.

Possible Adverse Effects

Removes 6–20 in (15–50 cm) of beach and organisms. May lead to erosion and cliff or beach retreat and inundation of backshores in extreme circumstances.

Primary Equipment	Number Required		Optimum Treatment Rate [3 yd^3 (2.2 m^3) bucket 2/3 full]
	100 ft (30 m) Haul Distance	500 ft (150 m) Haul Distance	
Bulldozer and:	1	1	—

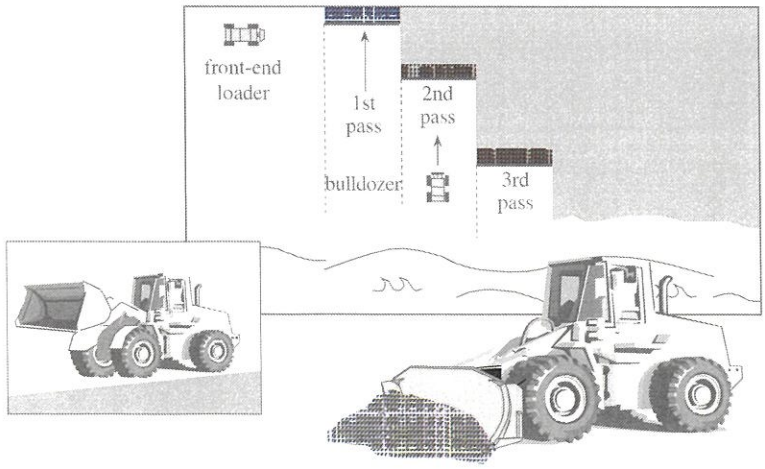

Figure 12-18 Bulldozer/Front-End Loader Combination Treatment Pattern

Table 12-23 Mechanical Sediment Removal–Backhoe

Description

Operates from top of a bank or beach and from a shore to remove oiled sediments and loads them into a truck.

Application

Use to remove oiled material, including logs and debris.

Possible Adverse Effects

Removes 6 – 20 in (15 – 50 cm) of beach and organisms. May lead to reduction of beach stability and beach retreat.

Primary Equipment	Number Required		Optimum Treatment Rate
	0.45 yd^3 (0.3 m^3) Bucket	0.6 yd^3 (0.4 m^3) Bucket	
Backhoe	4	3	6.4–6.8 hr/acre (16–17 hr/hectare)

Road for heavy equipment, barge or landing craft			

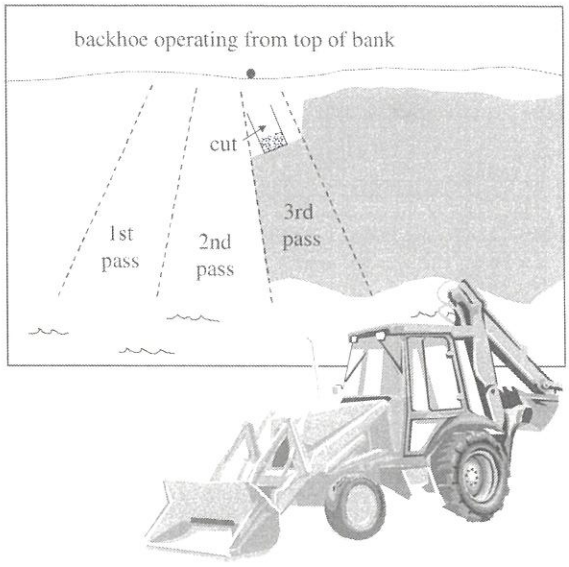

Figure 12-19 Backhoe with Front Bucket Treatment Pattern

12.7 Bioremediation

Biodegradation is the microbial conversion of hydrocarbons in oil to carbon dioxide and water. It typically occurs at an oil-water interface and may be limited by the availability of oxygen, moisture, and nutrients, particularly nitrogen and phosphorus. Biodegradation rate is a function of temperature.

Bioremediation is acceleration of the microbial conversion of hydrocarbons in oil to carbon dioxide and water. This typically occurs through application of nutrients where organisms are metabolically limited. On many shorelines, the limiting nutrients will be nitrogen and phosphorus, which can be applied in the form of fertilizer.

- In temperate climates, bioremediation generally works best during summer months, provided sufficient moisture is present.
- Low ambient temperatures do not necessarily exclude bioremediation. Activity has been recorded at temperatures below freezing, and biodegradation does occur in arctic areas during summer.
- In most cases, other forms of treatment may be required prior to nutrient addition to achieve the desired enhancement rate.

Most areas of the world have indigenous bacteria capable of degrading oil.

- The use of products containing non-native bacteria and enzymes is currently not recommended because they are generally not required and may be detrimental.
- The decision to use bioremediation should be based on the nature of an oil, the character of an affected shoreline, and the relevant political jurisdiction.

Bioremediation is typically used as a final treatment step after completing conventional shoreline treatment or in locations where other forms of treatment are either not possible or not recommended. In cases where surface oiling is either moderate or high, water or chemical washing of a shoreline is recommended as a first step to remove bulk oil. For light surface oiling and subsurface oil, bioremediation may be considered without pre-treatment. Any pooled oil, mousse, or tar balls should be manually or mechanically removed before attempting bioremediation.

The challenge for bioremediation is to supply nutrients in such a way that they are not applied in excessive amounts and are not washed away by tides, beach runoff, or any water supplied by mechanical sprinkler systems. For similar reasons, application of nutrients to spills on open water is not recommended.

Data collected to date indicate that when application guidelines are followed, the environmental risks associated with bioremediation are negligible.

- Toxicity concerns to biota in the water column and on the shoreline are primarily related to ammonia concentration.

- Ammonia is not a problem when nutrients are properly applied.
- Concerns about algae blooms due to increased nutrient levels need to be addressed, especially for beaches with relatively poor natural flushing.

Fertilizer application does not preclude future physical treatment techniques, but it will be most effective after physical techniques have been conducted.

- Applying fertilizer at the same time that any tilling or berm relocation is done would be particularly effective.
- Experience has shown that fertilizer applications are most effective when applied some time after the initial oiling, probably at least 14 days after oil has become incorporated into beach material.
- There is time to get fertilizers to the spill site after the spill has occurred. Therefore, it is unnecessary to stockpile fertilizers as part of contingency planning.

Application rates. For a liquid fertilizer, for example containing 7–8% nitrogen and 3% phosphorus, a suitable application rate of 0.75 gal/100ft^2 (300 g/m^2) may be used. When using solid, time-release fertilizers use a suitable application rate for example of 4 lb/100 ft^2 (200 g/m^2). These fertilizers typically contain 25-30% nitrogen and 3-4% phosphorous. Reapplicaton may be warranted.

12.8 Chemical Treatment Methods

Chemical treatment products can increase the efficiency of water-washing oiled shorelines, seawalls, and docks. These products include treatment chemicals, such as COREXIT EC9580. For use on shorelines, such products must be listed on government-approved product schedules in some countries.

An important consideration in selecting a chemical treatment product is whether the authorities require that the oil be recovered or allow it to be dispersed into the sea.

- When recovery of the washed oil is required, a shoreline treatment product may be applied as a pre-soak at a rate of 0.5 to 1 gallon per 100 ft^2 (2–4 liters per 10 m^2) 10 to 15 minutes before water washing.
- No chemical cleansing product is normally needed in the wash water.
- Boom is used to contain the oily washings in the area immediately offshore.
- Washing should be done during an incoming tide.
- Skimmers and/or sorbents are used to recover the released oil from the surface of the water.
- For spot washing applications, sorbents (in the form of pads, snares, or booms) can be placed around the base of the rock surfaces to be cleaned in order to recover oil from the wash water.

In the US, the Environmental Protection Agency maintains a list of products that may potentially be used in the event of an oil spill response. Other countries may maintain similar lists.

12.9 Inland Spills

Inland spills present a variety of challenges in regard to soil composition, vegetation, geology, bodies of water and water tables, and access to spill site in some cases. The proximity of human populations, land use, and potable water sources should be considered in developing response strategies. Depending on the season, inland spills may have a high potential for wildlife exposure. For spills on or near roadways, traffic control and safety may be the dominant factors in response decision-making.

A spill on land can occur to the surface (e.g., tanker truck rollover, train derailment) or subsurface (e.g., pipeline, underground storage tank). It may be difficult to model the trajectory or path of oil due to natural contours of the land, vegetation, and manmade structures. Oil on land is greatly influenced by the sorbtive capacity of land surfaces, will flow down slope to lower lying areas, and can flow to surface waters or ground waters. A spill to flowing freshwater has a greater potential for transporting a slick than a spill to a quiesant lake or pond.

12.9.1 Cleanup Strategies

As with spills on water, cleanup operations on land should begin as soon as possible. Response options include mechanical recovery, in-situ burning, manual collection, and bioremediation. Unlike response on water, where the spreading of oil is unabated except for the use of containment boom, other barrier, or when oil strands on a shoreline, containing a spill on land can be done by berms, dams, sorbents or trenches.

Response strategies should consider the type of land oil is spilled on, the season, and the type of oil, which will influence the slick transport, its weathering, and potential effects (e.g., including adhesion, penetration, degradation, and toxicity). For example,

- Gasoline does not adhere well to vegetation in comparison to heavy crude, and it will degrade and evaporate much faster.
- Frozen ground in winter will be impermeable to spilled oil.

Natural depressions will cause pooling of surface oil that can be collected using skimmers and vacuum systems. The use of heavy machinery, such as bulldozers and front-end loaders should be considered in view of potential damage to some substrates (see Section 12 treatment guides). For altered terrains and in developed areas, their use may be preferred. For spills on or near roadways, vapor suppression

and firefighting may be the preferred initial response strategy. Use of in-situ burning should consider proximity to populated areas due to estimated particulates in the smoke plume and its forecast trajectory.

12.10 Material Take Off (MTO) List

A wide variety of equipment is used to conduct shoreline treatment.

Equipment	Use
Graders/draglines	Shoreline treatment
Tractor/rippers	Shoreline treatment
Front-end loaders	Shoreline treatment
Beach cleaners	Shoreline treatment
Discers	Shoreline treatment
Backhoes	Shoreline treatment
Bulldozers	Shoreline treatment
Elevating scrapers	Shoreline treatment
Flatbed, dump trucks	Removal of oiled material
Vacuum trucks	Removal of pooled liquid
Garbage cans and bags	Removal of oiled material
Portable tanks	Storage of recovered materials
Sorbents	Recovery of pooled liquid
Booms and skimmers	Containment and removal of oil
Hand tools	Vegetation cutting, equipment repair
Shovels/rakes/pitchforks	Removal of oiled material
Protective clothing	Personal protection
Pumps/hoses	Transfer of collected oil
High-pressure washers	Low- and high-pressure washing
Steam cleaners	High-pressure washing
Sandblasting equipment	High-pressure washing
Fuel	Fueling equipment
Chemicals	Removal of oil coating on hard surfaces
Fertilizer	Biodegradation of oil

12.6 Physical Treatment Techniques

Physical techniques are typically used to remove oil stranded in an intertidal zone when natural recovery is not an acceptable response strategy. In this section, a series of tables presents information on physical treatment options, including a brief description of each method, where it likely would be applied, its possible effects, and the logistical support required. Treatment rates and personnel requirements have been estimated based on the level of effort generally required to treat an area in an 8-hr day. Techniques have been arranged in approximate order of their likely environmental impact, beginning with the least intrusive:

- Four methods used by cleanup teams to manually remove oil from shores are described in Tables 12-3 through 12-6.
- Treatment techniques involving the application of water to remove oil from sediments and bedrock have been summarized in Tables 12-7 through 12-9.
- Steam cleaning and sandblasting, sometimes used to remove oil from hard surfaces, are described in Tables 12-10 and 12-11. Operators and nearby crew of such equipment need PPE, especially respiratory protection from any aerosols created during use.
- Vacuums, including truck-mounted and portable units (see also Section 11.4) used to remove oil pooled on shore, are listed in Tables 12-12 and 12-13.
- Heavy machinery, used singly and in combination when access and other circumstances allow, are detailed in Tables 12-14 through 12-23. In selected circumstances, draglines or clamshell dredges could be used to collect oiled sediment and debris.

Many types of mobile mechanical equipment use inflatable tires, whose pressure can influence the efficiency of operation. It is advisable to adjust tire pressures to suit shoreline conditions.

Table 12-3 Sorbent Application

Description

Sorbents are applied manually to soak up non-sticky oil stranded on shore. Pom-poms are positioned in the intertidal zone as a passive array to collect viscous (sticky) oil.

Application

Use on all shore types to remove small accumulations of oil.

Possible Adverse Effects

Foot traffic may disturb sediments and affect organisms. Birds and small mammals may ingest particulate sorbents if they are left uncollected.

Equipment	Quantity Required (per day)
Sorbent sheets	20 bales (100–200 pads/bale)
Sorbent rolls	20 rolls [36 in (90 cm) x 150 ft (45 m)/roll]
Sorbent boom	20 bales [4 ft (1.2 m) length x 8 in (20 cm) dia. x 10 ft (3 m)/bale]
Pom-poms (for viscous (sticky) oil)	10 bales (100/bale)
Pitchforks, rakes, etc.	10–20
6-mil (0.15 mm) plastic bags (white or light color)	10 cartons (40–50/carton)
Personnel	**Optimum Treatment Rate**
10–20 workers	Treatment rate is highly variable. Expect up to 1/4 gal (1 liter)/pad of oil recovery, depending on oil type.
1 foreman for every 10 workers	
Disposal	**Suggestion**
Pads and rolls	Disposal is facilitated by rolling up sorbent and placing it in suitable containers.
Boom	Disposal is accomplished by folding, rolling and/or stuffing the boom into plastic bags for removal.
Loose material	Loose sorbent materials are not recommended for use on oil on water or tidal shorelines due to difficulty in recovery for disposal.
Access	
Light motor vehicle, shallow craft or helicopter	

Table 12-4 Manual Removal of Oiled Materials

Description
Oiled sediment and debris are removed by hand, shovels, rakes, etc.

Application
Use on mud, sand, gravel, and cobble when oiling is light, sporadic, and/or at or near the beach surface, or on beaches where there is no access for heavy equipment.

Possible Adverse Effects
May disturb/remove sediment and shallow burrowing organisms.

Equipment	Number Required	
	Lightly Oiled Shoreline [~1.2 miles (2 km)]	**Heavily Oiled Shoreline [~1.2 miles (2 km)]**
Shovels, rakes, picks	10–20	50–100
Debris box or super sac	2	3–4
ATV[1] with trailers or wheelbarrows	1–2	1–2
Personnel	**Lightly Oiled Shoreline [~1.2 miles (2 km)]**	**Heavily Oiled Shoreline [~1.2 miles (2 km)]**
Workers	10–20	50–100
Foremen	1–2	5–10
Access		
Foot path, road, shallow craft or helicopter		

[1] ATV is an All Terrain Vehicle.

Table 12-5 Manual Scraping

Description

Oil is manually scraped from substrate using hand tools.

Application

Use on lightly oiled boulders, rocks, and man-made structures or heavy accumulations when other techniques are not allowed or are not practical.

Possible Adverse Effects

May disturb sediment and remove or injure organisms. Unremoved or unrecovered oil can injure organisms that are repopulating the rocky substrate or inhabiting sediment downslope of cleanup activities.

Equipment	Number per Crew
Paint scrapers	1 per worker (plus several extra to allow for loss of edge or breakage)
Sharpening tool (file/hone)	1
Rakes, shovels, trowels	1 each per worker
Plastic bags	75–100
Ground cover (for initially catching removed oil) such as: • Plastic film • Cloth • Sorbents	1–3 rolls
Personnel	**Optimum Treatment Rate**
5 crews of 10 workers each	The treatment rate is highly variable, depending on degree of oiling, type of substrate, and the number of non-oiled plants and animals to be protected.
1 foreman for each crew	
Access	
Foot path, shallow craft, or helicopter	

Table 12-6 Vegetation Cutting

Description

Oiled vegetation is cut by hand, collected, and put into bags or containers for disposal.

Application

Use on oiled vegetation.

Possible Adverse Effects

May disturb and remove sediment and organisms. Heavy foot traffic may cause root damage and delayed recovery. May cause erosion due to loss of vegetation.

Equipment	Number per Crew
Cutting tools such as: • Scythes • Power cutters • Shears	3–4 (plus 1 or 2 extra in case of breakage or dull blades)
Sharpening tool (file/hone)	1
Collecting tools such as: • Pitch forks • Rakes	4–6
Plastic bags	75–100
Ground cover such as: • Plastic film • Burlap • Sorbents	1–3 rolls
Personnel	**Optimum Treatment Rate**
5 crews of 10 workers each	Each crew can cut and bag about 77 yd^2/hr (65 m^2/hr) of vegetation on a heavily vegetated shoreline.
1 foreman for each crew	
Access	
Foot path, shallow craft or helicopter	

Table 12-7 Low Pressure, Cold-Water Washing

Description

Low-pressure water spray removes oil from substrate and channels it to recovery points. [Nozzle pressure is kept below 100 psi (690 kPa)].

Application

Use to wash oil from mud, cobble, boulder, rock, man-made structures, and vegetation.

Possible Adverse Effects

May create a potential for re-oiling and disturbance of organisms downslope of cleanup if oil is not contained and removed.

Primary Equipment	Type	Number
Washing unit (pump and hoses)	10–20 psi (70–140 kPa) pressure @ 50–100 gpm (190–380 L/min)	3–5
Vacuum system	110 barrel (17.5 m^3) capacity	1–2
Pump and tank truck	50–75 gpm (190–285 L/min), 125 barrel (20 m^3) capacity	1–2
Equipment to contain and recover loosened oil, if required	Boom and skimmer	
Personnel	**Optimum Treatment Rate**	
1–2 workers per washing or recovery unit; PPE required	The rate of treatment depends on the degree of oiling, type of oil and substrate and is difficult to forecast. (~220 gpm [50m^3/hr])	
1 foreman for every 10 workers; PPE required		
Access		
Road for heavy equipment, barge, or landing craft for trucks		
Light motor vehicle, shallow craft, or helicopter for washing unit		

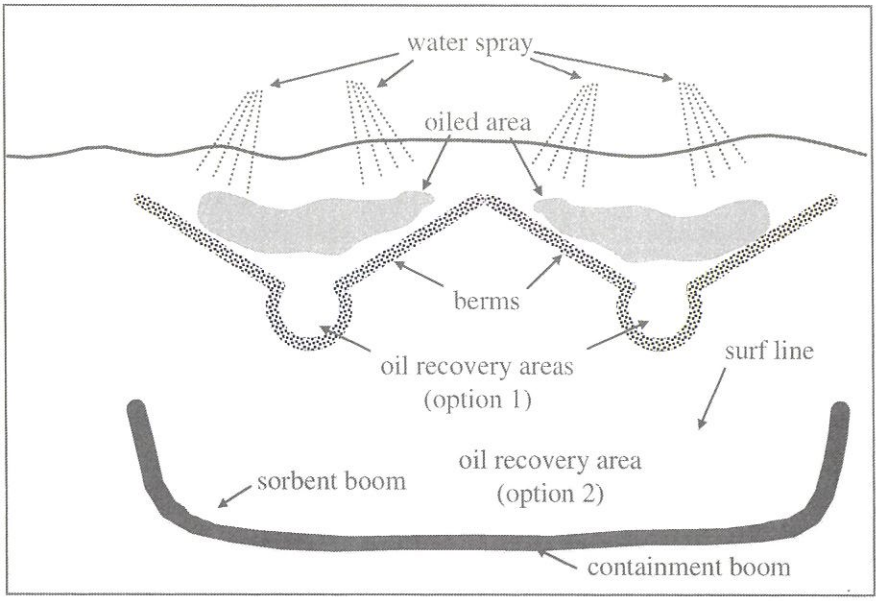

Figure 12-6 Low Pressure Flushing

Table 12-8 Low-Pressure, Warm-Water Washing/Cold-Water Flooding

Description

Heated seawater softens weathered oil; cold-water flooding moves the loosened oil to the adjacent water for collection. These two techniques can be used separately or together.

Application

Use on heavy concentrations of weathered, sticky oil that has reached sheltered or moderate energy shorelines composed of rock, cobble, and gravel.

Possible Adverse Effects

May injure intertidal organisms. High nozzle pressure can cause localized erosion.

Primary Equipment	Size of Unit	Quantity
Landing craft (or suitable trailers for land-based operations)	40–80 ft (12–24 m)	1
Direct-fired water heater	8 million BTU/hr (2340 kW) 125 gpm (475 L/min) @ 140°F (60°C)	2
Pumps	6 in (15 cm) @ 100 psi (690 kPa)	2
Generator	70 hp (50 kW)	1
Containment boom	inshore boom	600 ft (180 m)
Sorbent boom		300 ft (90 m)
Fire hoses/nozzles	1/2–1 in (1.25–2.5 cm)	4
Perforated flushing header, corrugated pipe	6 in (15 cm)	100 ft (30 m)
Manifold hose	6 in (15 cm)/4 in. (10 cm)	100 ft (30 m)
Snare boom/pom-poms		300 ft (90 m)
Support Equipment		
Water heater • Pump and generator • Landing craft		
Personnel	**Optimum Treatment Rate**	
2 crews of 10 workers each, 1 foreman for each crew; PPE required	The rate of treatment depends on the degree of oiling, type of oil and substrate, and is difficult to forecast. (~220 gpm [50m³/hr])	
Access		
Landing craft or road for heavy equipment, barge		

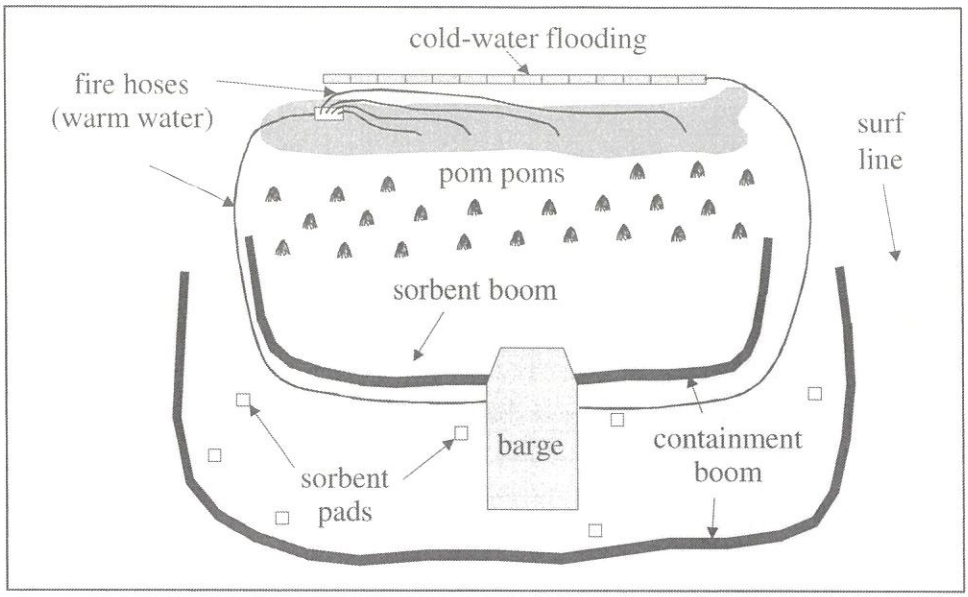

Figure 12-7 Low-Pressure, Warm-Water Washing/Cold-Water Flooding

Table 12-9 High-Pressure Washing

Description

High-pressure cold or warm water streams remove oil from substrate and channel it to a recovery area.

Application

Use to remove oil from boulder, rock, and man-made structures.

Possible Adverse Effects

May remove some organisms and shells from substrate. Can disturb substrate surface and wash oil into sub-surface sediments and downslope organisms.

Primary Equipment	Type	Number
Pressure washing unit	Self-contained 10 gpm (38 L/min) @ 4000 psi (27,000 kPa)	2–3
Equipment to contain and recover loosened oil, if required	Boom and skimmer	
Support Equipment	**Type**	**Number**
Vacuum system	60–80 barrel (9.5–13 m^3) capacity	1
Trash pump	25–50 gpm (95–190 L/min)	1
Tank truck	60–80 barrel (9.5–13 m^3) capacity	1
Personnel	**Optimum Treatment Rate**	
1–2 operators per pressure washing unit; PPE required	One unit that produces 3,000–4,000 psi (20,000–26,667 kPa) pressure can clean 7–15 ft^2 (0.75–1.5 m^2) per minute.	
1–2 workers per recovery equipment; PPE required		
1 foreman for every 10 workers; PPE required		
Access		
Road or barge for heavy equipment, trucks		
Light motor vehicle path, shallow craft, or helicopter for washer only		

Table 12-10 Steam Cleaning

Description

Steam removes oil from substrates and it is channeled to a recovery area.

Application

Use to remove oil coatings from man-made structures, boulders, and rock. Establish an exclusion zone.

Possible Adverse Effects

Removal of and mortality to some organisms are likely. Oil not recovered can affect organisms downslope of cleanup activities.

Primary Equipment	Size of Unit	Number Required	Optimum Treatment Rate
Steam cleaner	280 psi (1930 kPa) @ 325°F (163°C)	4–6	600 ft²/hr (55 m²/hr)
Vacuum truck	80–100 barrel (12.7–15.9 m³) capacity	1–2	
Skimmer	Small	1–2	
Containment boom	2–4 x length of shoreline cleaned	2	

Consumables	Fresh Water Consumption/Unit
Steam cleaner	3.8–4.3 gpm (14–16 L/min)

Personnel
2 operators for each cleaning unit; PPE required
1 foreman for every 10 workers; PPE required

Access
Road for heavy equipment, trucks
Light motor vehicle path, shallow craft, or helicopter for steam cleaning units

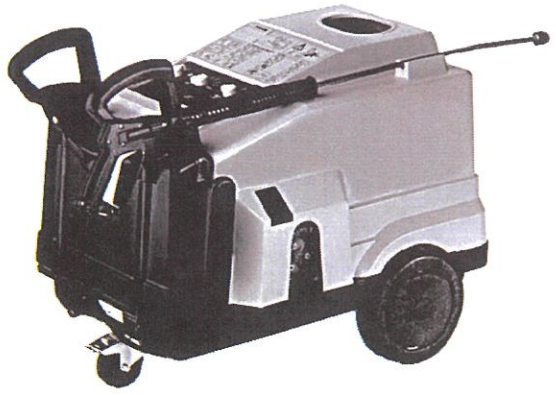

Figure 12-8 Steam Cleaner

Table 12-11 Sandblasting

Description

Sand moving at high velocity removes oil from a substrate.

Application

Use to remove thin oil residue from man-made structures and other hard surfaces. Establish an exclusion zone.

Possible Adverse Effects

May remove organisms and shells from a substrate and leave behind a clean, barren surface. Can affect downslope organisms. Adds sand to environment, along with potential re-oiling, erosion, and deeper oil penetration.

Primary Equipment	Number Required	Optimum Treatment Rate
Sandblasting unit (compressor included)	1	150 ft²/hr (14 m²/hr)
Sand supply truck	1	
Front-end loader (if used)	1	
Consumables	**Amount**	**Optimum Treatment Rate**
Sand	Approx. 1000 lb/hr (455 kg/hr)	150 ft²/hr (14 m²/hr)
Ground cover	1–3 rolls	
Personnel	**Number Required**	**Optimum Treatment Rate**
Workers for sandblasting	2–4; PPE required	150 ft²/hr (14 m²/hr)
Cleanup workers	2–3; PPE required	
Foreman	1; PPE required	
Access		
Road for heavy equipment, barge or landing craft		

Figure 12-9 Sand Blaster

Table 12-12 Vacuum Systems

Description

Truck or portable vacuum unit is positioned near oil pool or recovery site where oil is collected via vacuum hose.

Application

Use to remove oil accumulations on water in the absence of skimmers and to recover oil pooled in natural depressions on all shoreline types (except inaccessible vegetated or other areas). Unsafe for recovery of gasoline.

Possible Adverse Effects

May remove some organisms. Watch for collection of vapors.

Primary Equipment	Typical Suction Rate for Pooled Oil	Typical Suction Rate for Oil on Water	Typical Fill Time for 110-bbl (17.5 m^3) Tank
Vacuum unit[1] with 2–3 in (5–7.5 cm) suction hose and skimming head	50–100 gpm (190–380 L/min) (75% oil)	25–50 gpm (95–190 L/min) (5% oil)	0.75 hr @ 100 gpm (380 L/min) 1.5 hr @ 50 gpm (190 L/min) 3 hrs @ 25 gpm (90 L/min)

Range of Capacities	
Vacuum system	6–140 barrels (0.9 m^3–22.3 m^3)
6 in (15 cm) suction hose	700–900 gpm (2650–3400 L/min) maximum[2]
4 in (10 cm) suction hose	500–600 gpm (1900–2270 L/min) maximum[2]
3 in (7.5 cm) suction hose	50–400 gpm (190–1510 L/min) maximum[2]
2 in (5 cm) suction hose	50–200 gpm (190–760 L/min) maximum[2]

Support Equipment

Devices for herding oil on water can include:

- Boom
- Skimming boards
- Low-pressure water hoses
- Leaf blowers/air movers

Personnel

1 worker per suction hose

1–2 workers for containing, herding and manual skimming of oil

1 foreman for every 10 workers

Access

Road for heavy equipment, barge or landing craft

[1] Number of vacuum units required is dependent on the quantity of oil, the number of recovery sites, and the oil-to-water ratio.

[2] Intake is completely submerged, drawing fluid with little or no suction lift.

Table 12-13 Sump Pump/Vacuum System

Description

Oil flows into and collects in a sump where it is removed by pump or vacuum unit.

Application

Use on firm sand or mud beaches that are being continuously oiled.

Possible Adverse Effects

May cause removal of organisms due to excavation of 2–4 ft (0.6–1.2 m) sump. Watch for collection of vapors.

Primary Equipment	Typical Suction Rate for Thick Oil [0.08 in (2 mm)]	Typical Suction Rate for Thin Oil [0.04 in (1 mm)]	Typical Fill Time for 110-bbl (17.5 m^3) Tank
Vacuum unit[1] or high capacity pump typically with 2–3 in (5–7.5 cm) suction hose and skimming head	75 gpm (285 L/min) 50 gpm (190 L/min) (50% oil)	50 gpm (190 L/min) 25 gpm (95 L/min) (5% oil)	1 hr @ 75 gpm (285 L/min) 1.5 hr @ 50 gpm (190 L/min)

Range of Capacities	
Vacuum unit	6–140 barrels (0.9 m^3–22.3 m^3)
Tank truck	20–160 barrels (3.2 m^3–25.4 m^3)
6 in (15 cm) suction hose	700–900 gpm (2650–3400 L/min) maximum[2]
4 in (10 cm) suction hose	500–600 gpm (1900–2270 L/min) maximum[2]
3 in (7.5 cm) suction hose	50–400 gpm (190–1510 L/min) maximum[2]
2 in (5 cm) suction hose	50–200 gpm (190–760 L/min) maximum[2]

Personnel
1 worker per suction hose
1–2 workers for containing, herding and manual skimming of oil
1 foreman for every 10 workers

Access
Road for heavy equipment, barge or landing craft

[1] Number of vacuum units or pumps required is dependent on the quantity and collection rate of oil in the sump.

[2] Intake is completely submerged, drawing water with little or no suction lift.

Table 12-14 Beach Cleaner

Description
Pulled by tractor or self-propelled across a beach picking up tar balls or patties.

Application
Use on lightly oiled (tar balls or patties) sand or gravel beaches.

Possible Adverse Effects
May disturb upper sediments and shallow-burrowing organisms.

Primary Equipment	Number	Optimum Treatment Rate
Operated at 4 mph (6.4 km/hr)	1	25 min/acre (1 hr/hectare)
taking a skim cut 6 ft (1.8 m) wide Operated at 1 mph (1.6 km/hr) taking a deep cut 6 ft (1.8 m) wide	1	1.4 hr/acre (3.5 hr/hectare)
Support Equipment		
Tractor (rubber-tired)		
Personnel		
1 operator for each piece of equipment		
Access		
Road for heavy equipment, barge, or landing craft		

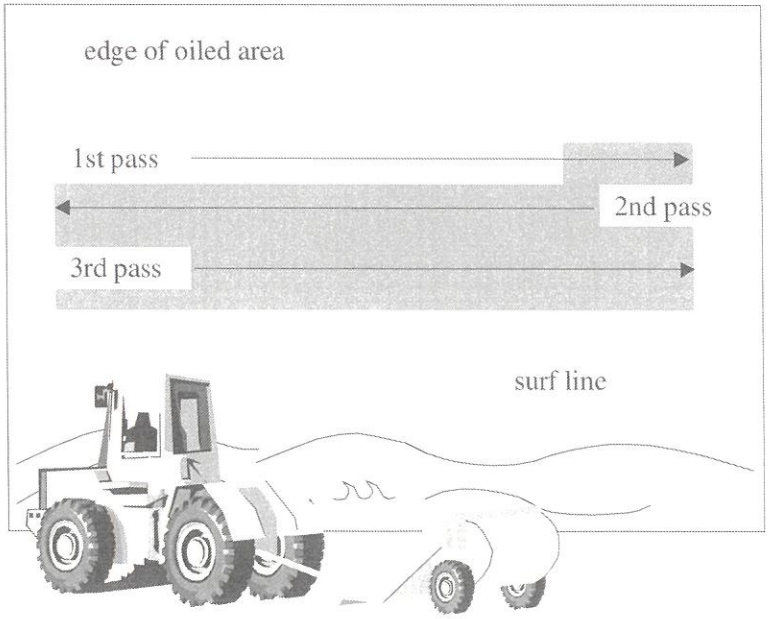

Figure 12-10 Beach Cleaner Treatment Pattern

Table 12-15 Heavily Oiled Sediment Mixing-Tractor/Ripper

Description

Tractor fitted with either a ripper or tines is operated up and down beach (so sediments remain and erosion is minimized) to promote evaporation and weathering by shoreline processes.

Application

Use on heavy surface oiling ("pavement") on cobble, gravel, and sand beaches. Use on low amenity beaches. Use where substrate removal would cause erosion.

Possible Adverse Effects

May disturb sediments and both shallow- and deep-burrowing organisms.

Primary Equipment	Number Required	
	66 ft (20 m) x 1.2 mi (2 km) Area	165 ft (50 m) x 1.2 mi (2 km) Area
Tractor/ripper	1	2

Personnel	Optimum Treatment Rate
1 operator for each piece of equipment	Machine operating at 1.5 mph (2.4 km/hr) can rip a 10 ft (3 m) swath at 1.8 acres/hr (7280 m²/hr). About 1.2 mi (2 km) of beach can be cleaned per day.

Access
Road for heavy equipment, barge or landing craft

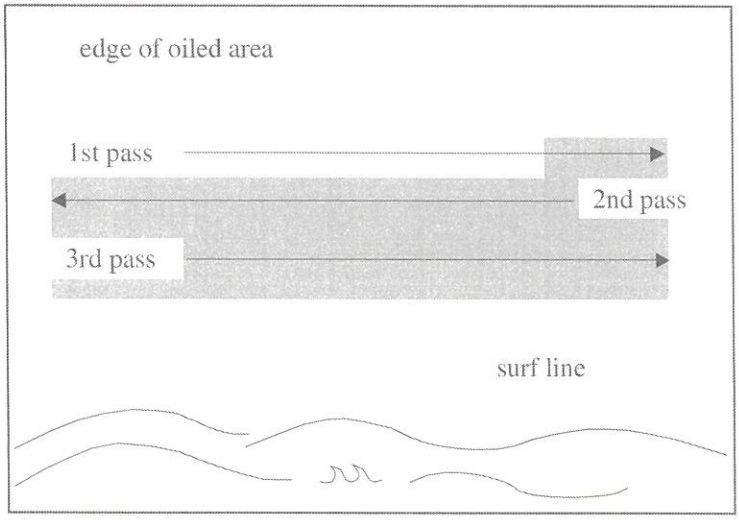

Figure 12-11 Tractor/Ripper Treatment Pattern

Table 12-16 Lightly Oiled Sediment Mixing-Discer

Description
Tractor pulls discing equipment along an oiled area to promote evaporation and weathering by shoreline processes.

Application
Use on lightly oiled, non-recreational sand and gravel beaches.

Possible Adverse Effects
May disturb surface substrate and shallow-burrowing organisms.

Primary Equipment	Number Required	Optimum Treatment Rate
Tractor (track-type preferred, Rubber-tired 2nd choice) and:	1	
8 ft (2.4 m) wide discer 12 ft. (3.6 m) wide discer	1 1	0.3–0.4 hr/acre (0.75–1 hr/hectare) 0.2–0.3 hr/acre (0.5–.75 hr/hectare)
Personnel		
1 operator for each piece of equipment		
Access		
Road for heavy equipment, barge or landing craft		

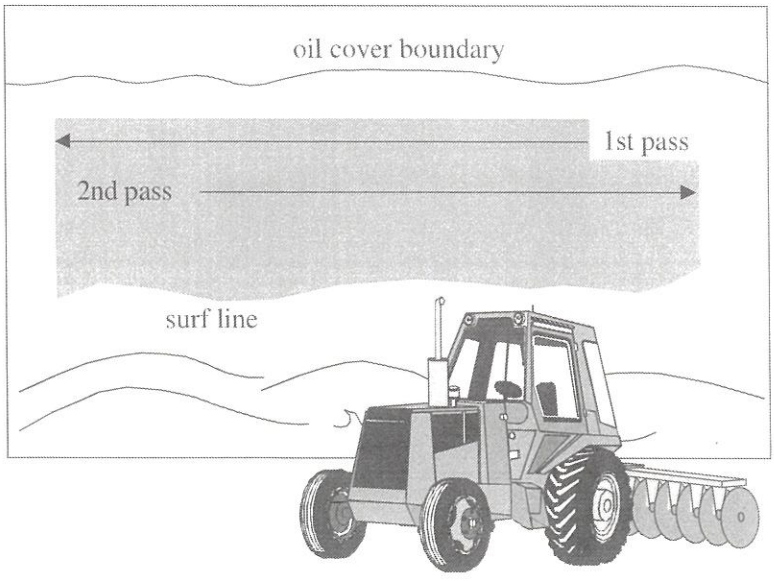

Figure 12-12 Discer Treatment Pattern

Table 12-17 Surf Washing–Bulldozer

Description

Mechanical equipment pushes oiled substrate into the surf zone to accelerate natural cleaning while causing minimal erosion.

Application

Use on level gravel and cobble beaches or firm sand where erosion of beach or backshore area is a concern.

Possible Adverse Effects

Leaves oil in the intertidal zone (re-oiling is possible) and may disrupt the top layer of substrate. Because of a less accurate depth of cut and pushing of sediments, considerable mixing of sediments is likely.

Primary Equipment	Number Required		Optimum Treatment Rate
	66 ft (20 m) wide oiled zone	165 ft (50 m) wide oiled zone	
Bulldozer	2	5	264 ft (80 m) shoreline/hr

Personnel	Optimum Treatment Rate
1 operator for each piece of equipment	Each bulldozer covers about 5 hr/acre (12.5 hr/hectare)

Access
Road for heavy equipment, barge, or landing craft

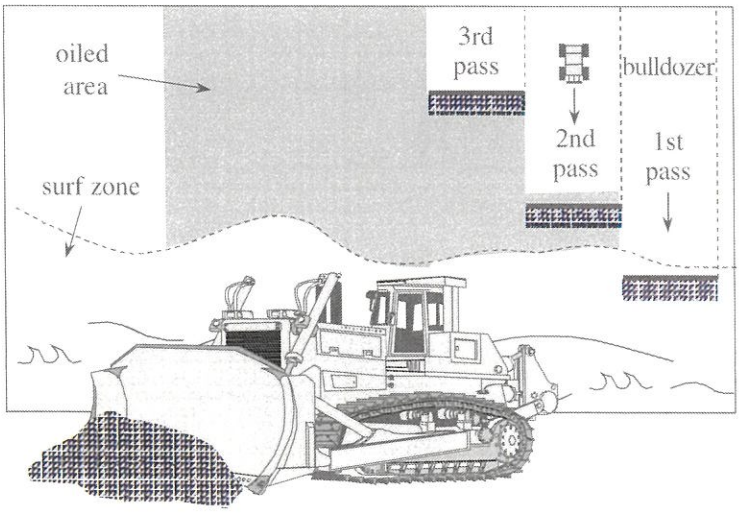

Figure 12-13 Bulldozer Treatment Pattern

Table 12-18 Mechanical Surface Cleaner–Elevating Scraper

Description

Elevating scraper collects oiled material directly off a beach.

Application

Use to remove surface oil, tar balls, and patties on sand and gravel beaches.

Possible Adverse Effects

May cause disturbance of upper sediments (<1 in/2.5 cm) and shallow- and deep-burrowing organisms. Minor reduction of beach stability may lead to erosion and beach retreat.

Primary Equipment (elevating scraper)	Number Required		Optimum Treatment Rate
	500 ft (150 m) Haul Distance	2,000 ft (600 m) Haul Distance	
20 yd^3 (15 m^3) Holding capacity	2	4	1.2–1.4 hr/acre (3–3.5 hr/hectare)
10 yd^3 (7.5 m^3) Holding capacity	4	8	
Estimated Maximum Hourly Waste Generation			
Approx. 100 yd^3 (76 m^3) with a 6 in (15 cm) cut			
Personnel			
1 operator for each piece of equipment			
Access			
Road for heavy equipment, barge or landing craft			

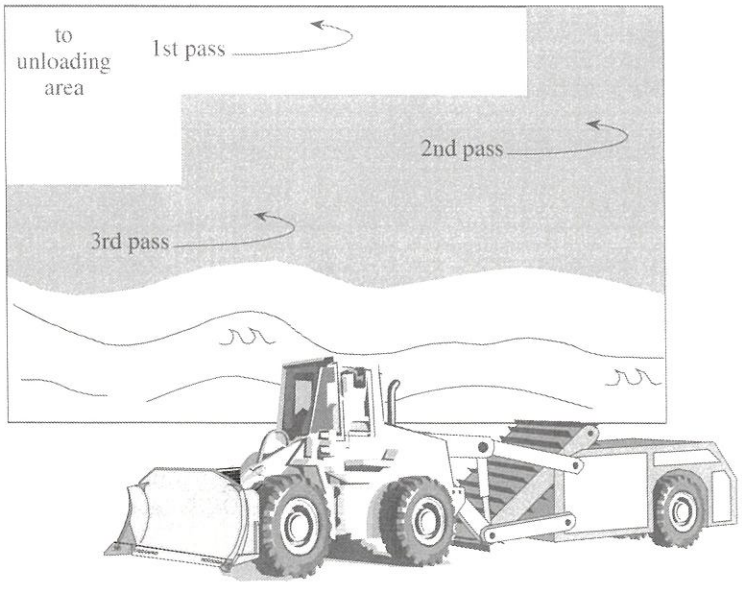

Figure 12-14 Elevating Scraper Treatment Pattern

Table 12-19 Mechanical Sediment Removal — Motor Grader/Elevating Scraper Combination

Description
Motor grader forms windrows for collection by an elevating scraper.

Application
Use to remove surface oil on hard-packed sand with good trafficability.

Possible Adverse Effects
May cause disturbance of upper beach sediments (up to 6 in (15 cm) or greater) and shallow-burrowing organisms. May remove clean material.

Primary Equipment	Number Required		Optimum Treatment Rate
	500 ft (150 m) Haul Distance	2,000 ft (600 m) Haul Distance	
Motor grader and:	1	1	—
Elevating scraper: 20 yd^3 (15 m^3) Holding capacity	2	4	1.2–1.4 hr/acre (3 to 3.5 hr/hectare)
10 yd^3 (7.5 m^3) Holding capacity	4	8	
Estimated Maximum Hourly Waste Generation			
Approx. 620 yd^3 (475 m^3) with a 6 in (15 cm) cut			
Personnel			
1 operator for each piece of equipment			
Access			
Road for heavy equipment, barge or landing craft			

Note: Spillage from graders can increase when multiple passes are made to side-cast oiled sediments.

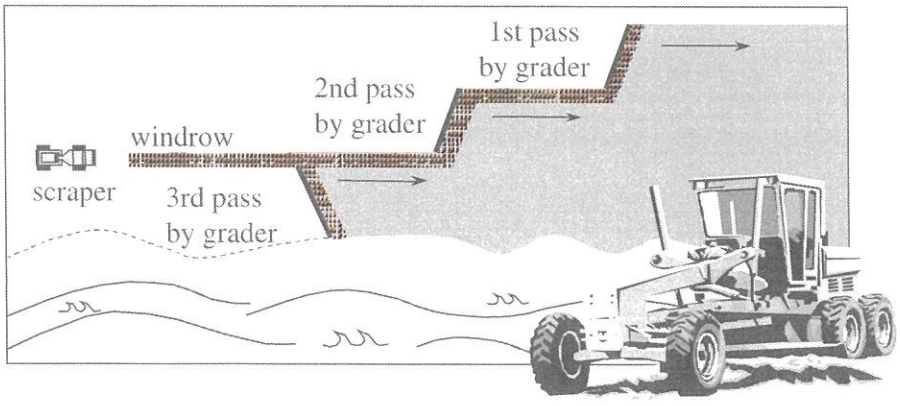

Figure 12-15 Motor Grader/Elevating Scraper Combination Treatment Pattern

Table 12-20 Mechanical Sediment Removal–Front-End Loader

Description

Front-end loader collects material directly off a beach and hauls it to an unloading area. 1st choice: rubber-tired loaders, 2nd choice: track-type loaders

Application

Use on light-to-moderately oiled firm mud, firm sand, gravel, and (especially) cobble beaches where oil penetration exceeds 1 in (2.5 cm) and on extensively oiled vegetation. Depth of cut is ~ 6 in (15 cm).

Possible Adverse Effects

May remove sediment and shallow- and deep-burrowing organisms. Reduction of beach stability may lead to beach erosion and retreat.

Primary Equipment	Number Required		Optimum Treatment Rate [3 yd^3 (2.2 m^3) bucket 2/3 full]
	100 ft (30 m) Haul Distance	500 ft (150 m) Haul Distance	
Front-end loader (rubber-tired: preferred)	2	4	3.2–3.4 hr/acre (8–8.5 hr/hectare)
Front-end loader (track-type: 2nd choice)	2	6	4.4–4.6 hr/acre (11–11.5 hr/hectare)

1 operator for each piece of equipment			
Access			
Road for heavy equipment, barge or landing craft			

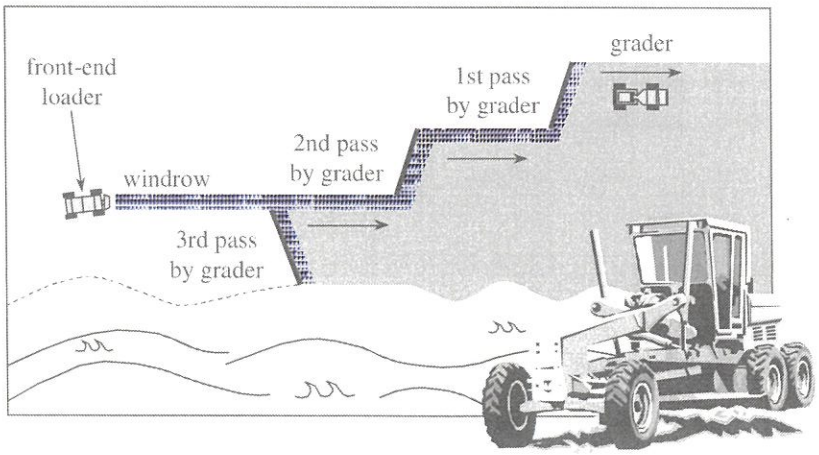

Figure 12-17 Motor Grader/Front-End Loader Combination Treatment Pattern

Table 12-22 Mechanical Sediment Removal–Bulldozer/Front-End Loader (Rubber-Tired) Combination

Description

Bulldozer pushes oiled substrate into piles for pickup by front-end loader.

Application

Use on level, heavily oiled coarse sand, gravel, and cobble beaches with poor trafficability.

Possible Adverse Effects

Removes 6–20 in (15–50 cm) of beach and organisms. May lead to erosion and cliff or beach retreat and inundation of backshores in extreme circumstances.

Primary Equipment	Number Required		Optimum Treatment Rate [3 yd^3 (2.2 m^3) bucket 2/3 full]
	100 ft (30 m) Haul Distance	500 ft (150 m) Haul Distance	
Bulldozer and:	1	1	—

12.7 Bioremediation

Biodegradation is the microbial conversion of hydrocarbons in oil to carbon dioxide and water. It typically occurs at an oil-water interface and may be limited by the availability of oxygen, moisture, and nutrients, particularly nitrogen and phosphorus. Biodegradation rate is a function of temperature.

Bioremediation is acceleration of the microbial conversion of hydrocarbons in oil to carbon dioxide and water. This typically occurs through application of nutrients where organisms are metabolically limited. On many shorelines, the limiting nutrients will be nitrogen and phosphorus, which can be applied in the form of fertilizer.

- In temperate climates, bioremediation generally works best during summer months, provided sufficient moisture is present.
- Low ambient temperatures do not necessarily exclude bioremediation. Activity has been recorded at temperatures below freezing, and biodegradation does occur in arctic areas during summer.
- In most cases, other forms of treatment may be required prior to nutrient addition to achieve the desired enhancement rate.

Most areas of the world have indigenous bacteria capable of degrading oil.

- The use of products containing non-native bacteria and enzymes is currently not recommended because they are generally not required and may be detrimental.
- The decision to use bioremediation should be based on the nature of an oil, the character of an affected shoreline, and the relevant political jurisdiction.

Bioremediation is typically used as a final treatment step after completing conventional shoreline treatment or in locations where other forms of treatment are either not possible or not recommended. In cases where surface oiling is either moderate or high, water or chemical washing of a shoreline is recommended as a first step to remove bulk oil. For light surface oiling and subsurface oil, bioremediation may be considered without pre-treatment. Any pooled oil, mousse, or tar balls should be manually or mechanically removed before attempting bioremediation.

The challenge for bioremediation is to supply nutrients in such a way that they are not applied in excessive amounts and are not washed away by tides, beach runoff, or any water supplied by mechanical sprinkler systems. For similar reasons, application of nutrients to spills on open water is not recommended.

Data collected to date indicate that when application guidelines are followed, the environmental risks associated with bioremediation are negligible.

- Toxicity concerns to biota in the water column and on the shoreline are primarily related to ammonia concentration.

- Ammonia is not a problem when nutrients are properly applied.
- Concerns about algae blooms due to increased nutrient levels need to be addressed, especially for beaches with relatively poor natural flushing.

Fertilizer application does not preclude future physical treatment techniques, but it will be most effective after physical techniques have been conducted.

- Applying fertilizer at the same time that any tilling or berm relocation is done would be particularly effective.
- Experience has shown that fertilizer applications are most effective when applied some time after the initial oiling, probably at least 14 days after oil has become incorporated into beach material.
- There is time to get fertilizers to the spill site after the spill has occurred. Therefore, it is unnecessary to stockpile fertilizers as part of contingency planning.

Application rates. For a liquid fertilizer, for example containing 7–8% nitrogen and 3% phosphorus, a suitable application rate of 0.75 gal/100ft^2 (300 g/m^2) may be used. When using solid, time-release fertilizers use a suitable application rate for example of 4 lb/100 ft^2 (200 g/m^2). These fertilizers typically contain 25-30% nitrogen and 3-4% phosphorous. Reapplicaton may be warranted.

12.8 Chemical Treatment Methods

Chemical treatment products can increase the efficiency of water-washing oiled shorelines, seawalls, and docks. These products include treatment chemicals, such as COREXIT EC9580. For use on shorelines, such products must be listed on government-approved product schedules in some countries.

An important consideration in selecting a chemical treatment product is whether the authorities require that the oil be recovered or allow it to be dispersed into the sea.

- When recovery of the washed oil is required, a shoreline treatment product may be applied as a pre-soak at a rate of 0.5 to 1 gallon per 100 ft^2 (2–4 liters per 10 m^2) 10 to 15 minutes before water washing.
- No chemical cleansing product is normally needed in the wash water.
- Boom is used to contain the oily washings in the area immediately offshore.
- Washing should be done during an incoming tide.
- Skimmers and/or sorbents are used to recover the released oil from the surface of the water.
- For spot washing applications, sorbents (in the form of pads, snares, or booms) can be placed around the base of the rock surfaces to be cleaned in order to recover oil from the wash water.

In the US, the Environmental Protection Agency maintains a list of products that may potentially be used in the event of an oil spill response. Other countries may maintain similar lists.

12.9 Inland Spills

Inland spills present a variety of challenges in regard to soil composition, vegetation, geology, bodies of water and water tables, and access to spill site in some cases. The proximity of human populations, land use, and potable water sources should be considered in developing response strategies. Depending on the season, inland spills may have a high potential for wildlife exposure. For spills on or near roadways, traffic control and safety may be the dominant factors in response decision-making.

A spill on land can occur to the surface (e.g., tanker truck rollover, train derailment) or subsurface (e.g., pipeline, underground storage tank). It may be difficult to model the trajectory or path of oil due to natural contours of the land, vegetation, and manmade structures. Oil on land is greatly influenced by the sorbtive capacity of land surfaces, will flow down slope to lower lying areas, and can flow to surface waters or ground waters. A spill to flowing freshwater has a greater potential for transporting a slick than a spill to a quiesant lake or pond.

12.9.1 Cleanup Strategies

As with spills on water, cleanup operations on land should begin as soon as possible. Response options include mechanical recovery, in-situ burning, manual collection, and bioremediation. Unlike response on water, where the spreading of oil is unabated except for the use of containment boom, other barrier, or when oil strands on a shoreline, containing a spill on land can be done by berms, dams, sorbents or trenches.

Response strategies should consider the type of land oil is spilled on, the season, and the type of oil, which will influence the slick transport, its weathering, and potential effects (e.g., including adhesion, penetration, degradation, and toxicity). For example,

- Gasoline does not adhere well to vegetation in comparison to heavy crude, and it will degrade and evaporate much faster.
- Frozen ground in winter will be impermeable to spilled oil.

Natural depressions will cause pooling of surface oil that can be collected using skimmers and vacuum systems. The use of heavy machinery, such as bulldozers and front-end loaders should be considered in view of potential damage to some substrates (see Section 12 treatment guides). For altered terrains and in developed areas, their use may be preferred. For spills on or near roadways, vapor suppression

and firefighting may be the preferred initial response strategy. Use of in-situ burning should consider proximity to populated areas due to estimated particulates in the smoke plume and its forecast trajectory.

12.10 Material Take Off (MTO) List

A wide variety of equipment is used to conduct shoreline treatment.

Equipment	Use
Graders/draglines	Shoreline treatment
Tractor/rippers	Shoreline treatment
Front-end loaders	Shoreline treatment
Beach cleaners	Shoreline treatment
Discers	Shoreline treatment
Backhoes	Shoreline treatment
Bulldozers	Shoreline treatment
Elevating scrapers	Shoreline treatment
Flatbed, dump trucks	Removal of oiled material
Vacuum trucks	Removal of pooled liquid
Garbage cans and bags	Removal of oiled material
Portable tanks	Storage of recovered materials
Sorbents	Recovery of pooled liquid
Booms and skimmers	Containment and removal of oil
Hand tools	Vegetation cutting, equipment repair
Shovels/rakes/pitchforks	Removal of oiled material
Protective clothing	Personal protection
Pumps/hoses	Transfer of collected oil
High-pressure washers	Low- and high-pressure washing
Steam cleaners	High-pressure washing
Sandblasting equipment	High-pressure washing
Fuel	Fueling equipment
Chemicals	Removal of oil coating on hard surfaces
Fertilizer	Biodegradation of oil

13 Oiled Wildlife Response

13

13.1 Introduction

This section is intended as an overview and to provide general guidance when dealing with wildlife in conjunction with oil spill response activities. New technology and methods have increased the success rate for oiled wildlife response. Research continues to improve the successes of oiled wildlife response. The basic sequence of steps in oiled wildlife response is:

- Hazing
- Capture and transport
- Processing captured animals
- Health assessment / triage
- Stabilization and cleaning
- Conditioning and release
- Necropsy and disposal

Success of a rescue program will depend on the level of cooperation with government agencies and wildlife rehabilitators. Capture of and care for oiled wildlife can be a hazardous activity and a rescue program will be successful only if people are not injured or placed at unreasonable risk. In addition to the health and safety information in Section 2, there are special considerations due to the potential for injury and infection from the capture and caring of wildlife.

Oiled wildlife response is logistics-intensive and requires significant planning for trained personnel, equipment, and facilities. The sooner oiled wildlife are captured and rehabilitated, the better their chance of survival. Although many animal species can be exposed by oil spills, birds are the most likely to be affected by oil spills as they may fly into an oiled area, on land or on water. Therefore, birds are used as wildlife examples in the process flow depicted in Figure 13-1 and in the Decision Trees provided in Figures 13-4 and 13-5.

13.2 Key Considerations

Important considerations in any wildlife response are to:

- Ensure the safety of the workforce
- Coordinate with the proper agencies and experienced rehabilitation organizations.

Following a significant oil spill, federal and state/provincial/territorial wildlife agencies and wildlife rescue centers should be contacted. These professionals are knowledgeable about vulnerable wildlife, including threatened or endangered species, and regulatory requirements including applicable wildlife permits. Additionally, it is often the case that an oiled wildlife hotline phone number will be provided for the public and regulatory authorities to report the locations of oiled animals.

13.3 Safety Guidelines

Wildlife rescue/rehabilitation workers can minimize risks associates with physical and chemical hazards by following the precautions below:

- Observe all safety precautions stated in the Health and Safety Plan. *Consult with site safety personnel as field conditions can change.*
- Wildlife capture and handling should be done by experienced personnel who are trained in oiled wildlife rescue and rehabilitation.
- Ensure wildlife rescue/rehabilitation workers are trained to deal with the hazards of work tasks and the proper use and limitations of personal protective equipment.
- Never conduct rescue/rehabilitation work alone; always work in teams.
- Wear approved personal protective equipment (goggles, gloves, non-skid boots or shoes, etc.).
- Maintain situation awareness in the field regarding hazardous conditions (e.g. weather, waves, tides, slippery terrain, venomous snakes, etc.)
- Keep animals below waist level to protect face and eyes from pokes, bites, and scratches. Animal bites or scratches have the potential to transmit diseases to the handler.
- Remove protective equipment and wash hands and face with soap and water or approved cleaners before eating, drinking, or smoking.
- Never eat, drink, or smoke in animal handling areas.
- Report all injuries or illnesses.

13.4 Wildlife Protection

Wildlife exposure to oil can occur through multiple routes. Exposure can occur from direct contact, through inhalation of volatile components of oil, through ingestion of oil-contaminated food or water, or through ingestion of oil as an animal cleans its oiled feathers, fur, or skin. The most effective method for protecting wildlife is to minimize potential exposure to surface oil. Therefore, the primary response strategy for wildlife protection emphasizes controlling the release and spread of spilled oil at a source. The use of dispersants, in-situ burning, protective booming, and mechanical recovery operations will help reduce the amount of oil that could potentially affect wildlife.

Wildlife species and habitats at risk should be rapidly identified and prioritized for protection. Oil-contaminated food sources including carcasses should be removed from the field.

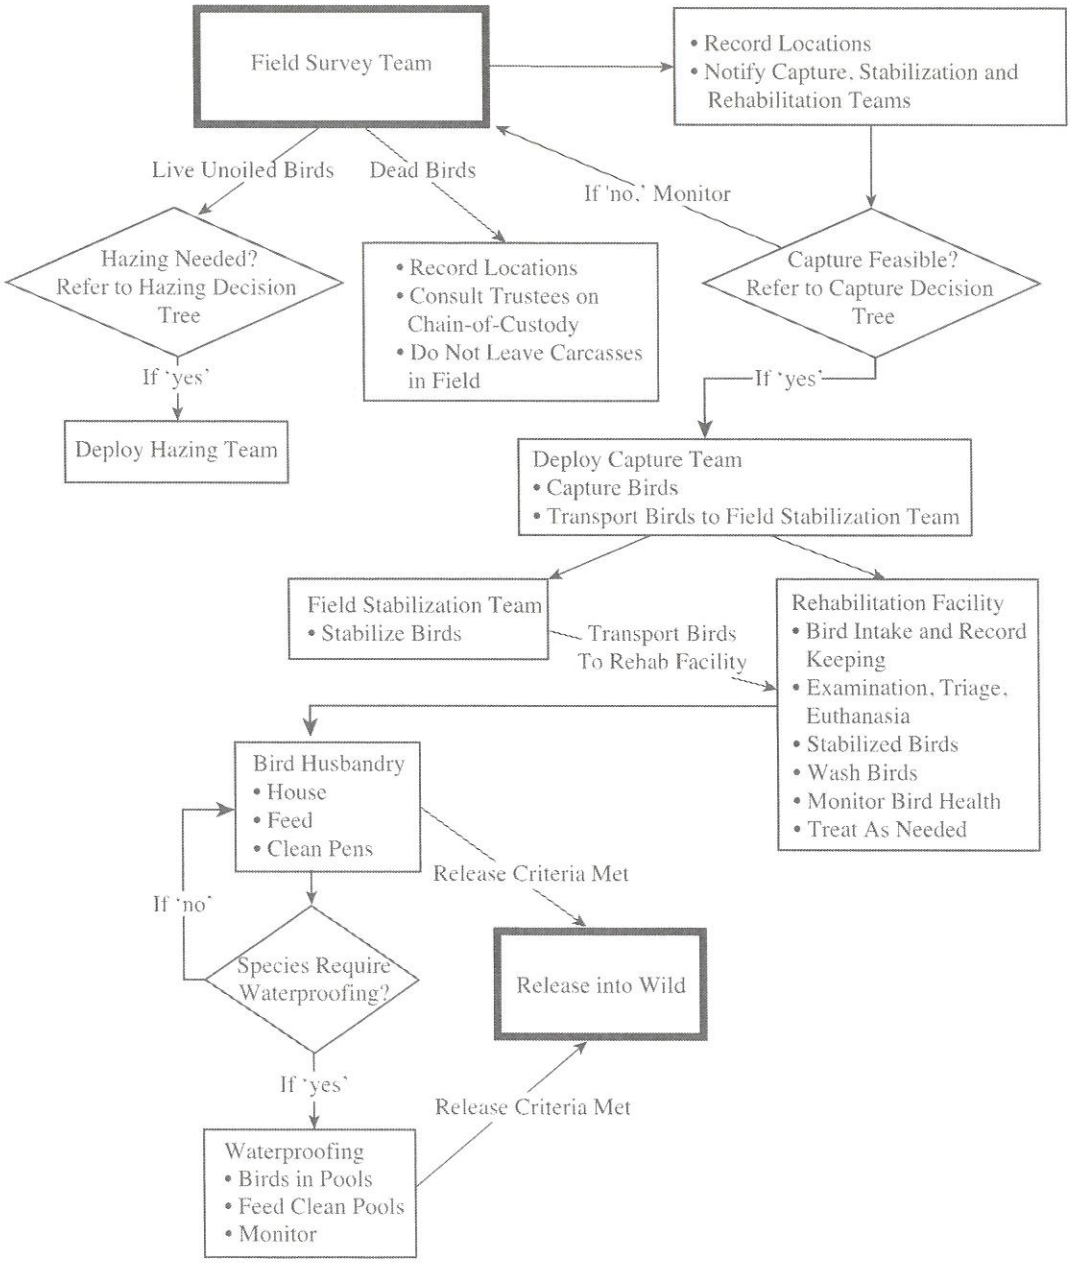

Figure 13-1 Bird rescue and rehabilitation process

13.5 Deterrence (Hazing)

Wildlife deterrent techniques can be used to move wildlife from locations that are in the predicted pathway of spilled oil. Hazing techniques can be used to deter wildlife from entering into areas that have been previously oiled. Hazing should be carefully planned and executed. It should be done in full cooperation with regulatory agencies responsible for wildlife, especially when dealing with threatened or endangered species. Figure 13-4 provides a decision tree to help determine whether hazing operations should occur. Hazing techniques include:

- Noise deterrents, including pyrotechnics, shotgun or pistol-launched projectiles, air horns, motorized equipment, propane cannons (Figure 13-2), and recorded bird alarm sounds.
- Scare devices, including deployment of reflective tape, helium-filled balloons (Figure 13-3), and scarecrows (either human or predator effigies) on oiled beaches.
- Herding wildlife using aircraft, boats, or other vehicles.
- Hazing by human presence.

Deterrent operations should consider the potential effects of human activity and disturbance on sensitive habitats and species. Disturbance of nesting, rookery, or haulout sites should be avoided as much as possible.

Figure 13-2 Noise deterrent - propane cannon

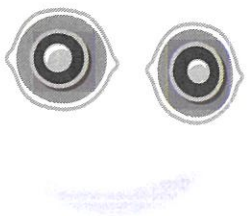

Figure 13-3 Visual deterrent - scare balloon

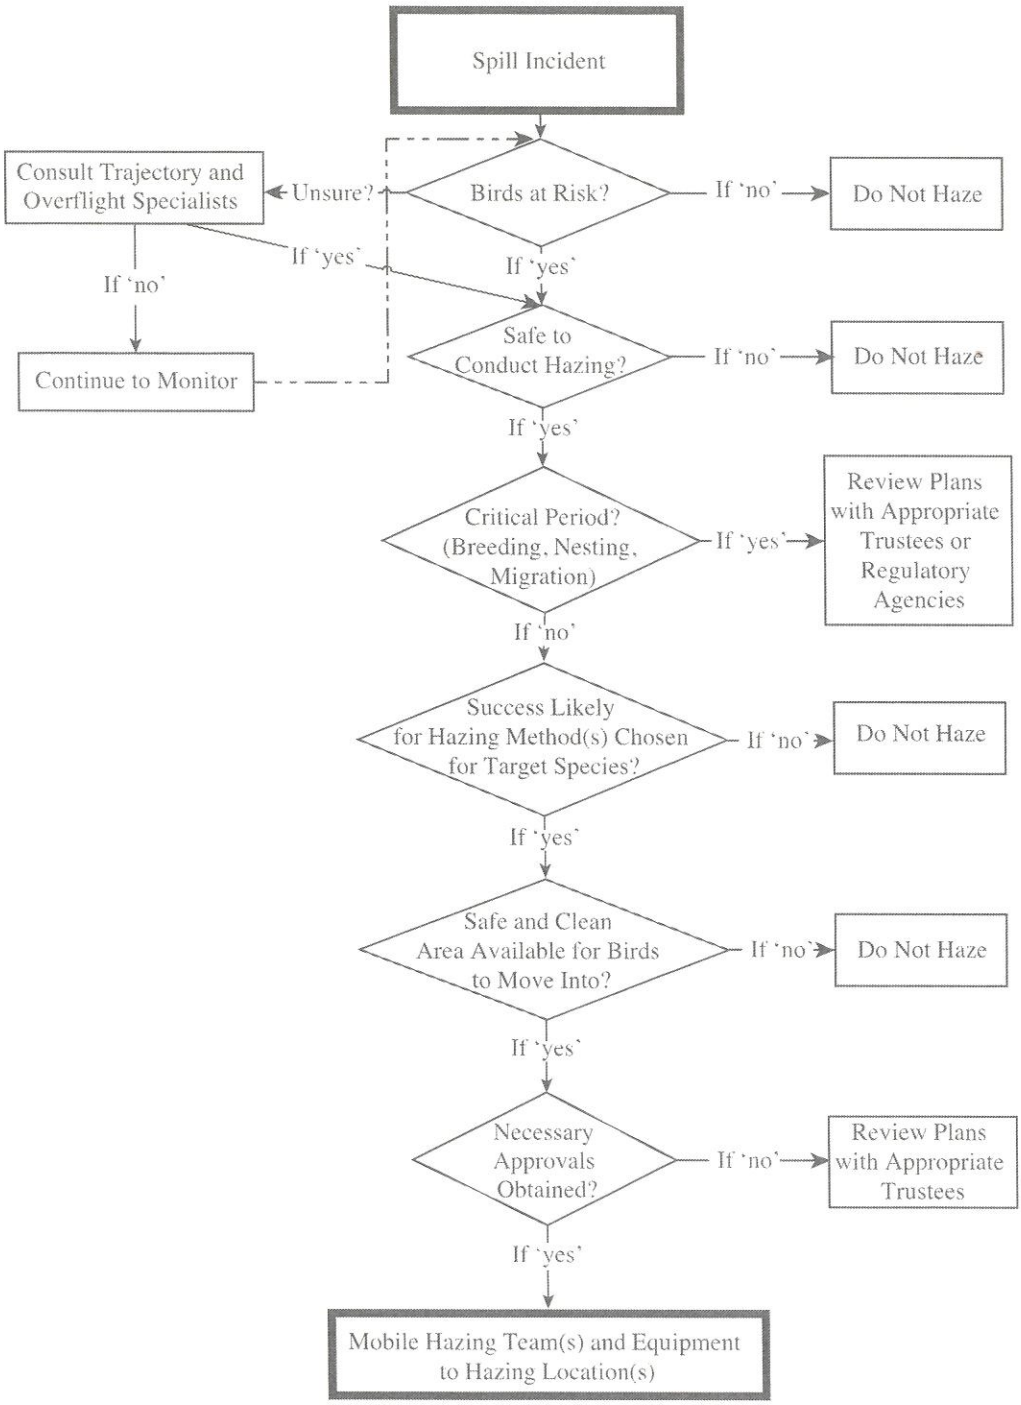

Figure 13-4 Hazing Decision Tree

13.6 Oiled Birds

Effects of oil on birds are separated into physical and toxicological effects. An example of a physical effect is oil coating and penetrating into feathers. When feathers become oiled, their water repellent and insulating properties are compromised. The loss of insulation can lead to hypothermia and possible death of an exposed animal. Toxicological effects of oil exposure can include irritation and damage to eyes, skin, and digestive tract. Many petroleum products are toxic to eggs. Spills occurring during nesting season are a concern, since adults with oiled feathers can contaminate nests, eggs, and young. During the breeding and nesting season, nesting areas should be given priority for protection. During response and clean-up operations, take care to minimize disturbance to nesting birds.

The following guidelines should be considered:

- Capturing birds is hazardous and should only be done by trained wildlife specialists.
- Once captured, birds should be handled and treated only by appropriately trained wildlife specialists.
- Threatened birds, especially large water birds (e.g., herons, loons, and cormorants) may strike at face and hands and cause serious injury.
- Boat-based capture efforts are usually less successful than land-based efforts, since oiled birds can easily elude wildlife specialists in boats.
- Wildlife specialists should wear protective clothing including glasses, gloves, and non-skid waterproof boots.
- Birds are best caught with either a long-handled fishing net or by throwing a towel, sheet, or throw net over them.
- Beached birds should be approached from the water to avoid driving them back into the water.
- To avoid injury to a wildlife specialist's eyes and face, captured birds should be held below waist level.
- Captured birds should be handled with extreme care and kept individually in warm, dry, quiet areas until release or transfer to trained caretakers.

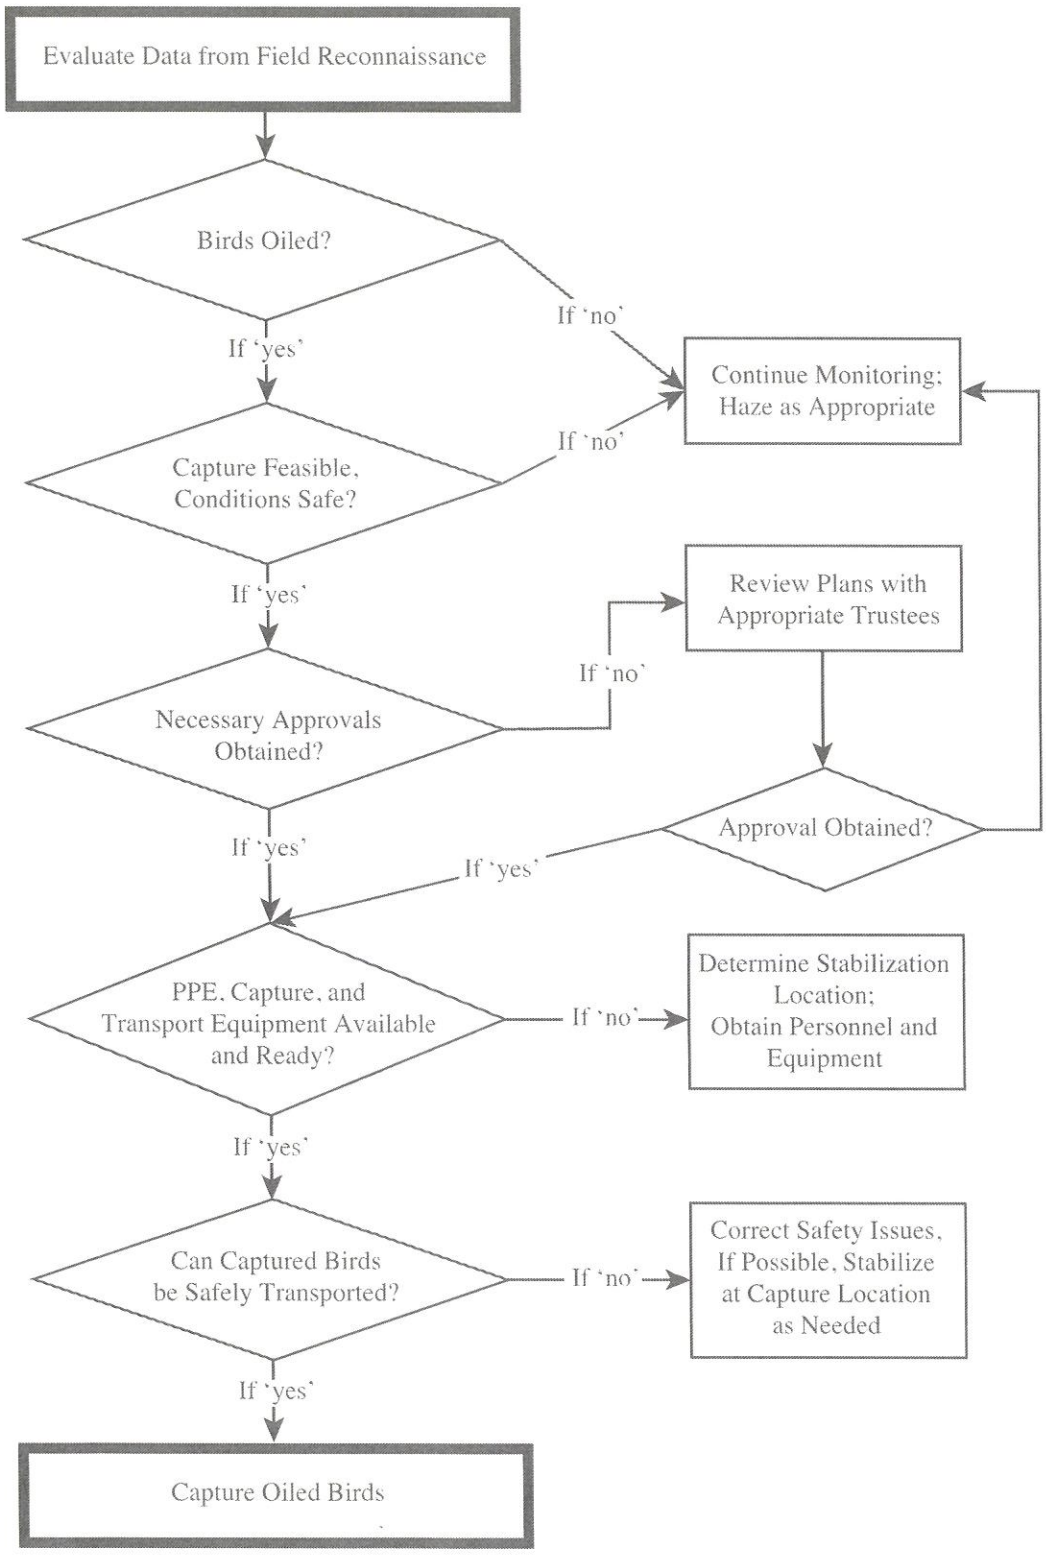

Figure 13-5 Decision Tree for Oiled Bird Capture

13.7 Oiled Mammals

Some groups of mammals are more vulnerable to oil spills than others. One observed effect of oil on some animals is their loss of body temperature control (thermoregulation). No thermoregulatory effect is expected for whales, dolphins, and manatees, which rely on blubber for insulation. However, sea otters and some seal species that depend on fur for insulation can be at risk of hypothermia. Oiling can disrupt the insulating properties of their fur and can be especially hazardous to young seals at pupping areas. Often, mammals that forage in intertidal areas (such as bear, deer, skunk, raccoon, and fox) can become exposed to oil. Contact with oil can cause skin or eye irritation. Regardless of habitat, oiled animals may try to clean themselves and can ingest oil. Depending on the amount of oil ingested, effects can occur to internal organs, the immune system, and reproduction. During spill response and clean-up operations, take care to minimize disturbances near seal rookeries or haul-out areas. Pup mortality can occur if pups are abandoned. If adults are disturbed and stampede, severe injury and mortality can occur to pups. Additionally, some mammals have inherent hazards of their own (claws, teeth) and can also be carriers of diseases such as rabies.

13.8 Oiled Reptiles and Amphibians

Oil exposure can cause both physical and/or toxicological effects. Physical effects include those from tarry residues causing blockage of nostrils, mouth, and gastrointestinal tract. Toxicological effects include skin and eye irritation, damage to internal organs, or mortality. Oil exposure can be toxic to eggs and could cause reduced hatching success and developmental abnormalities.

Sea turtles are endangered or threatened in many parts of the world. Therefore, sea turtle nesting beaches should be given priority for spill protection efforts. During spill response and clean-up operations, take care to minimize impacts to nesting beaches. Turtle eggs may need to be relocated to prevent oil contamination. Consult with regulatory authorities as to the best plan of action. Past spill events demonstrate that oiled turtles, snakes, and toads can be successfully rehabilitated and released.

Capturing turtles can be done using floating turtle traps which will reduce animal stress induced by chasing the animals (Figure 13-6). Venomous snakes may be encountered within the response zone and must only be handled by experienced wildlife handlers. Using reptile tongs and snake chaps will mitigate the risk of being bitten (Figure 13-7).

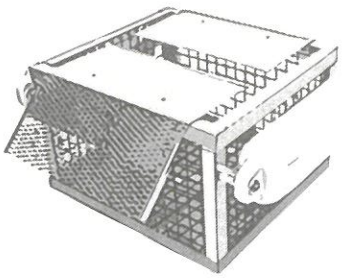

Figure 13-6 Floating turtle trap

Figure 13-7 Reptile tongs

13.9 Wildlife Treatment

Policies regarding capture, cleaning, and caring of wildlife vary in different countries. Within the United States, state and federal permits may be required depending on the animal types that are being captured. Consult with officials and prepare a wildlife management plan.

The capturing, cleaning, and caring for wildlife requires specialized procedures and wildlife professionals should be used to support a rescue and rehabilitation program and to direct less experienced workers.

Refer to the *Rehabilitation Manual for Oiled Birds* (cited in References) for more information.

13.10 Material Take Off (MTO) List

Equipment Description	Use
Baby Pool	Rehabilitation

13

14 Waste Management

14

14.1 Introduction

Waste disposal is a major oil spill response consideration. For large spills, as much waste can be generated as the amount of oil spilled and in some cases considerably more. In the 2002 Prestige spill, almost twice as much waste was collected as was spilled (117,000 tons vs. 63,000 tons spilled). It is important to develop waste management strategies that minimize the amount of waste generated by the response including oiled material as well as non-oiled material. Some response options, such as dispersants and burning, can significantly reduce the volume of waste generated.

A good practice is to remove debris from shorelines BEFORE the oil impact. Since oil recovery operations are rarely conducted near existing waste management facilities, it is critical to pre-identify, evaluate, and select waste management logistical infrastructure (trucks, containers, etc.) as well as storage and disposal options. Decisions regarding logistics, storage and disposal will depend on the size of a spill, its location, and local or regional regulatory requirements. Refer to the IPIECA Report Series, "Guidelines for Oil Spill Waste Minimization and Management" and ITOPF's Technical Information paper 'Disposal of Oil and Debris' for additional useful information.

Response to spills that will involve storing wastes for more than a few days should include the following:

- A thorough review of the applicable laws and regulations.
- Development of storage and disposal plans.
- Permit acquisition.

14.2 Waste Management and Regulations

Treatment, storage, handling, and disposal of waste materials may be subject to a variety of local, regional, and national laws and regulations, and may require special permits and/or other approvals. Oil spill wastes in some areas are considered "hazardous wastes" and are subject to special regulation. It is important to note that the legal responsibility of a waste generator begins from the time the waste is generated until final disposition.

Proper hazardous waste identification is necessary to appropriately manage the disposal of wastes. We can evaluate if a waste can be considered a hazardous waste by asking two questions: 1) Is the waste a listed hazardous waste? or 2) does it exhibit a characteristic of a hazardous waste? Plans for handling and temporary storage of wastes during initial stages of an oil spill response should be discussed with local stakeholders as well as regulatory agency personnel. It is suggested that local consultants be contacted. For example, some waste management companies

also offer emergency response services such as hazardous waste storage, transport and disposal and hazmat personnel.

Special consideration should be given to storage of wastes, depending on the anticipated quantity or volume, especially if the waste can be considered a hazardous waste. These considerations should include compatibility of the waste with the storage container in which the wastes are going to be placed; consideration of the odor or vapors that may be released into the atmosphere; and consideration of the characteristics and/or any chemical reactions that could be taking place with the wastes.

When developing waste minimization strategies, it is important to include waste management options that focus on recycling, reuse, and reclamation. While such options may have initial costs, the benefit in terms of elimination of future potential liability is often worth these added costs. Consideration of waste disposal operations should begin immediately upon the commencement of spill response efforts.

During any size response precautions must be taken to ensure worker safety and proper handling to minimize potential future liability. Suggestions included:

- Extensive photo / electronic documentation of any temporary storage sites as well as the operational area should be gathered; before, during and after the cleanup is finished.
- Secondary containment (i.e., placement of synthetic liners) should be placed under storage containers to prevent soil contamination.
- Storage container covers are essential to prevent rainwater entering which may cause the oil to float or overspill plus increasing the volume of oiled waste to be disposed which has cost implications.
- Secondary contamination of the immediate area / vehicles / personnel / roads from oily waste should be considered and actions taken to minimize this in the form of decontamination stations for personnel and vehicles.
- Testing, evaluation, inventorying, labeling, profiling and manifesting of wastes should be done in order to document that proper precautions, procedures, and regulations are followed.
- Security should be provided to prevent unauthorized dumping, vandalizing, and to ensure that waste storage does not endanger other parties.

A waste management plan following an oil spill should be based on the following principles:

- Provide safe working conditions and necessary personnel protection.
- Comply with all applicable laws and regulations.
- Minimize the amount of waste generated by implementing waste reduction principles.
- Minimize the possibility that disposed wastes will cause future environmental problems or require future remediation.
- Personnel handling hazardous wastes must be appropriately trained for such handling as mandated by governmental and regulatory agencies.
- Provide sufficient temporary and interim storage to prevent any bottleneck of recovery operations.
- Minimize risks of secondary pollution incidents in all operations.
- Cooperate with all local community and government agencies to minimize impacts on local waste disposal facilities.
- Handle, store, and transport oily wastes in appropriate containers/tanks.
- Consider response strategies that focus on segregation of waste streams at initial collection
- Segregate oily wastes and non-oily wastes to allow optimum reclamation and disposal of each waste stream.
- Sample and characterize each waste stream in order to understand risks and appropriate regulations.
- Complete appropriate waste profiles and submit to the selected disposal facility(ies) for approval.
- Dispose of all waste streams in a safe manner and at approved disposal sites.

14.3 Storage Equipment

Oil spill response operations can very quickly generate large volumes of waste. Completing arrangements for permanent disposition of wastes may require a great deal of time that could delay recovery operations. Therefore, facilities for temporary storage of waste should be provided. There are many temporary storage options that can meet operational requirements, including commercial products specifically designed for oil spill response, general-purpose devices, and containers of opportunity.

The selection of appropriate storage equipment and methods is based on the type and volume of material to be stored. The following factors should be considered:

- Storage location, e.g., offshore, onshore, or near shore.
- Storage capacity required.
- Type of material to be stored; e.g., fresh, emulsified or weathered oil, oil mixed with debris such as sorbents, sticks, trash, logs, seaweed, fishing equipment, sand, gravel, pebbles, cobbles.
- All wastes, especially hazardous wastes, should be protected from exposure to heat, fire, weather and should be secured. Containers which are used to store hazardous wastes should be compliant with all regulations.
- Duration of storage; e.g., days, weeks, or months.
- Access to storage sites.
- Consideration of storage in environmentally sensitive areas i.e., wildlife reserves during nesting seasons.
- Consideration should be given to the usage of regulatory-approved and / or performance-oriented shipping containers.
- Expected method of disposal.

Note that waste accumulation and storage locations should meet the following criteria:

- Spill prevention, control and countermeasures are in place.
- Storm water pollution prevention plans (rain water collection and control).
- Have severe weather (e.g., hurricane, flooding, etc.) contingency plans
- Ample storage space for the segregation of wastes which are not compatible.
- An emergency response plan should be developed for the waste accumulation/ storage location(s).

Table 14-1 lists options for storage of wastes and debris associated with oil spill cleanup operations and the appropriate timeframe for their use.

Table 14-1 Storage Options

Type of Storage	Estimated Timeframe for Use
Air (Inflatable) berm	Initial (days)
Container of opportunity	Temporary (weeks)
Deck barge with deck tanks (Must be regulatory approved)	Temporary (weeks)
Drum 55-gallon (208 liter)	Initial (days) - temporary (weeks)
Dumpster, Roll-On/Roll-Off	Temporary (weeks) - semi-permanent (months)
Dump truck (lined)	Initial (days)
Earthen dike (snow berm)	Initial (days)
Earthen pit (ice pit)	Initial (days)
Flexible, towable tank/bladder	Initial (days) and Temporary (weeks)
Fractionation ("Frac") Tanks, 21,000 gallon capacity	Initial (days) – temporary (weeks)
Heavy duty plastic trash bag	Initial (days) - temporary (weeks)
Livestock tank	Initial (days) - temporary (weeks)
Oilfield tank	Semi-permanent (months)
Open-top barge, lash barge, or hopper barge	Temporary (weeks)
Pillow tank	Initial (days) - temporary (weeks)
Plastic swimming pool	Initial (days)
Prefabricated kit	Initial (days) - temporary (weeks)
Skimmer vessel	Initial (days)
Supply boat with deck tanks	Temporary (weeks)
Tank barge	Temporary (weeks) - semi-permanent (months)
Tanker	Semi-permanent (months)
Tank truck	Temporary (weeks)
Vacuum or air conveyor truck	Initial (days) - temporary (weeks)

14.4 Storage Selection Guides

This section presents information on suitable options for temporary offshore and onshore / near shore storage according to spill size, oil weathering, and debris content.

The storage selection guides are used as follows:

1. Determine the appropriate storage selection guide [either offshore (Table 14-2) or onshore/near shore (Table 14-3)].
2. Estimate the storage capacity that will be needed.
3. Select the type of material to be stored; e.g., fresh or weathered oil, and with or without debris.
4. Estimate the required storage timeframe (Table 14-1).
5. Choose from storage options in the appropriate storage selection guide, Table 14-2 or Table 14-3, that are denoted by a ✓.
6. Consult Tables 14-4 through 14-25 for more information on each option.
7. Follow regulatory requirements for waste stream and container.

It is assumed that there will be no debris collected during offshore recovery (Table 14-2). If debris is present from an offshore spill, use the onshore/nearshore guide (Table 14-3). Care should be taken if oiled debris contains plant or animal matter because potentially dangerous gases can accumulate in closed storage devices.

Table 14-2 Offshore Storage Selection Guide

Offshore Storage					
Option	Spill Size[1]			Oil	
	Small	Medium	Large	Fresh[2]	Weathered
Deck barge with deck tanks	✓	✓	✓	✓	✓
Drum (55 gallon)	✓			✓	✓
Flexible towable tank	✓	✓	✓	✓	
Open-top, lash, or hopper barge		✓	✓		✓
Skimmer vessel	✓			✓	✓
Supply boat with deck tanks	✓	✓	✓	✓	✓
Tank barge		✓	✓	✓	✓
Tanker			✓	✓	✓

[1] Small <100 bbl (<16 m^3)
Medium 100–1000 bbl (16-160 m^3)
Large >1000 bbl (>160 m^3)

[2] Fresh, volatile oils should not be stored in open-top devices if vapors pose a health and/or safety risk.

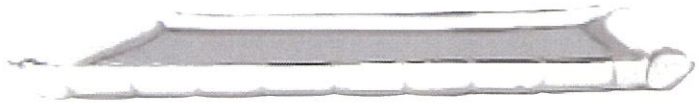
Table 14-3 Onshore/Nearshore Storage Selection Guide

Offshore Storage								
Option	Spill Size[1]			Oil Debris			Oil	
	Small	Medium	Large	Small Light	Large Heavy	Sand or Gravel	Fresh[2]	Weathered
Air (Inflatable) berm	✓					✓	✓	✓
Boom	✓	✓		✓	✓		✓	✓
Livestock Tank	✓	✓		✓	✓	✓	✓	✓
Deck barge with deck tanks			✓				✓	✓
Drum (55 gallon)	✓			✓		✓	✓	✓
Dump truck (lined)	✓				✓			✓
Earthen berm, earthen pit or snow berm	✓	✓		✓	✓	✓	✓	✓
FRAC tank	✓	✓		✓	✓		✓	✓
Heavy duty plastic trash bag	✓			✓		✓		
Oilfield tank	✓	✓	✓				✓	✓
Open-top, lash, or hopper barge			✓					✓
Pillow tank	✓						✓	
Plastic swimming pool	✓	✓						✓
Prefabricated kit	✓	✓	✓	✓	✓	✓		✓
Roll-On/Roll-Off dumpster	✓			✓	✓	✓	✓	✓
Skimmer vessel	✓	✓		✓			✓	✓
Supply boat with deck tanks			✓	✓		✓	✓	✓
Tank barge			✓				✓	✓
Tank truck	✓	✓					✓	
Tanker			✓				✓	✓
Towable tank	✓	✓	✓				✓	✓
Vacuum or air conveyor truck	✓	✓					✓	✓

[1] Small <100 bbl (<16 m^3)
Medium 100–1000 bbl (16-160 m^3)
Large >1000 bbl (>160 m^3)

[2] Fresh, volatile oils should not be stored in open-top devices if vapors pose a health and/or safety risk.

Table 14-4 Air (Inflatable) Berm

Capacity	• 20–70 barrels (3–10 tons)
Uses	• Storage of oily liquids, oily debris encircled by an air-inflated tube • Separation of oil/water and oil/debris
Auxiliary Equipment	• Air blower to inflate berm
Advantages	• Portable • Requires little storage space
Disadvantages	• Contents are lost if air chamber deflates

Table 14-5 Boom

Capacity	• Up to several hundred barrels
Uses	• Storage of oily liquids and oily debris
Auxiliary Equipment	• Anchors and or anchoring systems • Buoys
Advantages	• Adapts to any shoreline and size configuration • Readily available
Disadvantages	• On water applications only.

Table 14-6 Deck Barge with Deck Tank

	Capacity	• 10–1000 bbls (1.6–160 tonnes)
Uses	• Remote site storage, especially for oily liquids, debris
Auxiliary Equipment	• Tugboat is required for mobilization or movement and may be required for safety in exposed locations • Portable tanks, completely enclosed for liquid or open-top for heavily weathered oil or debris, hoses, pumps, etc.
Advantages	• May be readily available in major ports
Disadvantages	• River barges may not be usable offshore due to licensing/ certification restrictions (regulatory approvals); waivers take time to obtain; severe weather may make platforms unstable

Table 14-7 55-Gallon (208 Liter) Drum

Capacity	• 55 gal (208 liters)
Uses	• Liquid or oily solids storage
Auxiliary Equipment	• None
Advantages	• Easily accessible in most places • Portable
Disadvantages	• High weight/storage volume ratio • Can be difficult to handle by hand when full
Comments	• Can be carried aboard small boats or other boats to transport and store recovered materials from remote cleanup sites • Must be in regulatory approved condition for transport.

Table 14-8 Lined Dump Truck

Capacity	• 25 yd^3, 100 bbl (16 tonnes) average size
Uses	• Short-term storage of oily debris
Auxiliary Equipment	• Plastic line • Cover
Advantages	• Portable • Can be easily obtained • Handles variety of oily debris
Disadvantages	• Prone to leak liquids unless designed for liquid containment
Comments	• Line bed with plastic to prevent oil leakage • Over the road transport of waste must be conducted in conformance with regulations.

Table 14-9 Earthen Pit, Earthen Berm, Ice Berm or Ice Pit

	Capacity	• Up to several thousand barrels
Uses	• Shoreline storage of liquids and solids • Separation of oil from water and solids
Auxiliary Equipment	• Backhoe, bulldozer, or front-end loader • Pit liner (synthetic liner, usually 4.5 cm or greater thickness) that is compatible with oil; e.g., 6.0 cm high-density polyethylene or 2–3 in (5–8 cm) of clay (check regulations) • Pipe for monitoring wells (Not at all sites) • Fencing material • Bird hazing equipment • Soil tamper (optional)
Advantages	• Easy to install (once engineered) • Useful in many locations
Disadvantages	• May require permit or approval to construct • Can leak or walls can subside • May attract birds that could be injured by oil
Comments	• Excavated soil can be used to form an earthen dike • Surface must be packed smooth to prevent liner damage • Excavation pit can be used as additional storage • In the Arctic, water can be sprayed over snow to solidify a berm and reduce its permeability

Table 14-10 Flexible, Towable Tank (Dracone)

Capacity	• 14–12,500 bbls (2.2–2,000 tonnes)
Uses	• Storage of oily liquids
Auxiliary Equipment	• Vessel to tow tank • Transfer hose and pump • Cover
Advantages	• Portable • Compact for storage
Disadvantages	• May be difficult to empty (particularly if the contained product is viscous)
Comments	• Flexible tanks are fragile and must be towed slowly • Tube "dracones" are difficult to unload; "covered inflatable barges" with removable covers are easier to unload • Tank should be vented to prevent buildup of gases which may be hazardous

Table 14-11 Plastic Trash Bag or "Super Sac"

	Capacity	• About 7 ft^3 (0.2 m^3) trash bag maximum. "Super Sacs" 50 ft^3 (1.4 m^3)
Uses	• Storage of light oily debris
Auxiliary Equipment	• Crane for "Super Sacs"
Advantages	• Lightweight • Readily available
Disadvantages	• Can be punctured by sharp debris debris, can leak • Cannot be used to store liquids
Comments	• Heavy duty (3–4 mm or 0.1–0.15 in) or reinforced bags are preferred • "Super Sacs" best for lightly oiled sediment

Table 14-12 Livestock Tank

Capacity	• 5–50 bbls/unit (0.8–8 tonnes/unit)
Uses	• Liquid or oily solids storage • Separation of oil from water and debris
Auxiliary Equipment	• Hand tools required to assemble large livestock tanks • Hoses • Pumps
Advantages	• Portable • Available in many locations
Disadvantages	• Bulky to store when assembled unless stackable
Comments	• Containers of opportunity may be fish boxes, mining containers, or any leakproof containers available in the area of the spill

Table 14-13 "Frac" Tank

Capacity	• Up to five hundred barrels
Uses	• Storage of liquids
Auxiliary Equipment	• Transfer pump(s)
Advantages	• Readily available in many locations • Large storage capacity
Disadvantages	• Can only be used for storage, cannot be transported with waste inside. • Must be decontaminated following use.

Table 14-14 "Oilfield" Tank

Capacity	• Up to several hundred thousand barrels
Uses	• Storage of liquids
Auxiliary Equipment	• Transfer system
Advantages	• Rapid source of large storage capacity when available
Disadvantages	• Heavy; not generally available • Difficult to restore for clean product use • May not be appropriate in all cases
Comments	• Self-dumping hopper barges may need to be lined or have doors welded shut before use

Table 14-15 Open Top Barge, Lash Barge or Hopper Barge

Capacity	• Up to several thousand bbls
Uses	• Remote site storage, especially for oily debris
Auxiliary Equipment	• Tugboat is required for mobilization or movement and may be required for safety in exposed locations
Advantages	• May be readily available in major ports
Disadvantages	• River barges may not be usable offshore due to licensing/ certification; waivers take time to obtain
Comments	• Self-dumping hopper barges may need to be lined or have doors welded shut before use

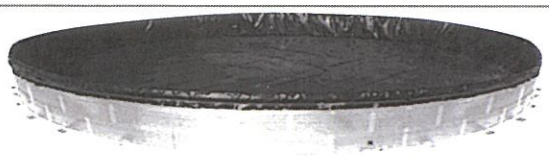
Table 14-16 Pillow Tanks

Capacity	• 10–1000 bbls (1.6–160 tonnes)
Uses	• Storage of liquids • Can be used in combination with a truck for storage and transport of oil
Auxiliary Equipment	• Hose and pump to fill and empty
Advantages	• Lightweight • Easily transportable to spill site • Compacts for storage
Disadvantages	• Can be accidentally punctured, very hard to decontaminate may become waste after use
Comments	• Some are transportable by helicopter

Table 14-17 Plastic Swimming Pools

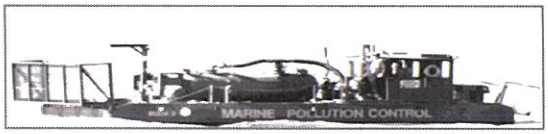
Size	• Varies, 10–20 ft (3–6 m) diameter and 4–5 ft (1–1.5 m) high
Capacity	• Up to 1000 bbls (160 tonnes)
Uses	• Shoreline storage of liquid or light debris
Auxiliary Equipment	• Hoses and pumps
Advantages	• Compacts for storage • Easily transportable to spill site
Disadvantages	• For short-term storage only since oil deteriorates the fabric, only used for very small amounts of waste
Comments	• Use a heavy-duty oil-resistant liner with the pool

Table 14-18 Prefabricated Kits

Capacity	• 50–50,000 bbls/unit (8–8000 tonnes/unit)
Uses	• Storage of liquids and oiled debris • Separation of oil from water and solids
Auxiliary Equipment	• Hand tools for field assembly • Mechanical equipment to install sub grade
Advantages	• Portable • Dismantles for easy storage
Disadvantages	• Requires flat surfaces
Comments	• Large units may require multiple days to assemble by unskilled workers

Table 14-19 Skimmer Vessel

Capacity	• Up to a few hundred bbls
Uses	• Initial storage of recovered oil
Auxiliary Equipment	• Transfer hose and pump
Advantages	• Portable
Disadvantages	• Very limited volume (hours of use at most)
Comments	• This storage can only be used for a limited period without transfer if the skimmer is to remain in operation

Table 14-20 Supply Boat with Deck Tanks

Capacity	• 10–1000 bbls (1.6–160 tonnes)
Uses	• Mobile storage and transfer from skimmers to shore for disposal
Auxiliary Equipment	• Portable tanks that are closed for liquid or open for heavily weathered oil or debris; e.g., debris containers and roll-on/ roll-off dumpsters
Advantages	• Highly mobile; can transit between spill site and shore at over 10 kts (5 m/sec)
Disadvantages	• Some vessels cannot tolerate addition of much topside weight because of stability concerns in severe weather • Limited deck space • May need regulatory approval for tanks, or receive waiver as needed.

Table 14-21 Tank Barge

Capacity	• Up to several thousand bbls
Uses	• Storage of liquids and weathered oil
Auxiliary Equipment	• Tugboat • Transfer hose and pump
Advantages	• Large volumes • Portable
Disadvantages	• Slow transit speed to spill site • Limited availability in remote areas • May have too much freeboard (when empty) to receive recovered oil from small skimmers
Comments	• When available, one of the best storage options for medium/large oil spills • Internal transfer pumps may be damaged by debris; external transfer pumps may be required for offloading • Heating coils help when pumping viscous products • Barge capacity of 10,000–20,000 bbls (1,600–3,200 tonnes) preferred • Decontamination after use is huge issue and generates more waste.

Table 14-22 Tank Vessel

Capacity	• Typically hundreds of thousands of bbls
Uses	• Storage of liquid and heavy oils
Auxiliary Equipment	• Transfer hose and pump
Advantages	• Portable • Large volume
Disadvantages	• Not normally available for oil spill response operation; deep draft and high freeboard
	• Regulations for use in oil recovery and at-sea transfer operations apply in some countries
	• Decontamination of vessel following use for waste is very difficult
Comments	• Probably the best storage option available for responding to a tanker spill, especially to lighter a stricken tanker

Table 14-23 Tank Truck

Capacity	• Up to 130 bbls (20 tonnes)
Uses	• Storage of liquids with minor quantities of debris
Auxiliary Equipment	• None
Advantages	• Can be easily obtained • Portable • Can transport oil to disposal site
Disadvantages	• Difficult to restore for clean products use (decontamination of tank is difficult)

Table 14-24 Vacuum or Air Conveyor Truck

	Capacity	• Large vacuum tanker, up to 130 bbls (20 tonnes)
Uses	• Short-term storage of liquids and oil solids • Separation of oil and water
Auxiliary Equipment	• None
Advantages	• Portable
Disadvantages	• May not be readily available or may be in short supply depending on spill location • Vacuum transfer to storage (e.g gulley-sucker) should not be used for volatile products

Table 14-25 Roll-On/Roll-Off Dumpster

Capacity	• 20 yd^3, 80 bbl (13 tonnes) average size
Uses	• Storage of oily debris
Auxiliary Equipment	• Plastic liner • Cover
Advantages	• Can be easily obtained • Handles variety of oily debris
Disadvantages	• Prone to leak liquids
Comments	• Line bed with plastic to prevent oil leakage • Cover dumpster to exclude precipitation and help control vapors depending on waste type

14.5 Waste Stream Segregation and Minimization

Each type of waste has different optimal disposal methods. It is important to:

- Segregate wastes by type.
- Minimize the quantity of each type.
- Avoid mixing hazardous and non-hazardous wastes together to prevent creating a larger volume of hazardous waste.
- Avoid mixing oiled and non-oiled (PPE / pre-cleaned debris from shoreline, domestic waste) together to prevent creating larger volumes of oiled waste.
- Label all waste containers and identify the source.

Waste can be segregated according to the following chart:

Liquid	Oily • Further segregate for final disposal • Reclaim at existing oil recycling/reclamation facility Non-oily • Process through municipal plant or other approved method • Construct closed loop systems that generate small volumes of waste
Solid	Oily • Transport to central waste processing center • Further segregate for final disposal Non-oily • Transport to shore for disposal at local landfills, Waste To Energy facilities • In Europe "zero" landfill policies may make this option extremely expensive for any type of waste
Special Wastes	Hazardous • Segregate and handle in accordance with regulations Non-hazardous • Maintain as separate waste stream until disposed

Guidelines for minimizing the amount of waste generated are listed in the following sub-sections.

14.5.1 Solid wastes

- Establish response strategies / procedures that segregate materials at collection.
- Do not mix any oil or oily wastes with domestic or non-oiled waste.
- Prevent oily wastes from contaminating soil: use liners underneath drums, tanks, and cleaning operation sites.
- When using manual cleanup methods, minimize the amount of underlying clean sediments that are collected.
- In some instances, use of non-hazardous detergents can be utilized to clean solids impacted by oily wastes (Note: this will most likely require additional approvals and may also generate a new waste stream that requires separate handling and characterization).
- Whenever any neat product or chemical is utilized, use all material in containers and wash out the residue in place (this may require the approval of regulatory agencies).

14.5.2 Liquid wastes

- Prevent water or debris from entering containers. Decant when permitted to minimize volumes and concentrate emulsions
- Determine disposal implications before using chemicals; depending on the chemical properties, non-hazardous oil can be considered as hazardous for disposal purposes.
- Use cleaners and wash water sparingly. Consider closed loop cleaning/ decontamination systems to minimize waste.
- Use decanting methodologies for recovered oil and water mixtures on site. This practice is approved in certain areas when proper protocols are applied (i.e., water treatment and discharge via a regulatory agency permit).

14.6 Disposal Methods

Non-oily wastes (e.g., PPE, sewage, domestic waste) generated during cleanup operations can be disposed of at local wastewater treatment plants and municipal landfills. In some countries, current "zero" landfilling initiatives may heavily impact selection of the preferred disposal method. Disposal taxes and other fees may influence the selection of options typically thought of as more expensive, but are preferred for financial as well as long term environmental liability management reasons.

Options for disposing of oiled and hazardous wastes (subject to regulatory requirements) include:

- Industrial landfilling
- Landfarming
- Open burning
- Portable incineration
- Commercial incineration, waste to energy facilities
- Reprocessing
- Reclaiming/recycling

With regard to sewage or septic wastes, it is important to note and consider that some areas require different permitting for storage and/or transportation of this type of wastes.

Further information on each disposal alternative above is provided in the tables below.

Table 14-26 Industrial Landfilling

Disposal Rate	• Depends on local capacity and access constraints, as well as governmental restrictions
Uses	• Disposal of bulky oil spill waste such as sea grass, shoreline vegetation, wood, sand, and general oiled trash
Auxiliary Equipment	• Earth-moving equipment and trucks
Advantages	• Useful for a wide variety of debris types • Can be implemented rapidly
Disadvantages	• Can lead to future environmental problems if containment fails
Comments	• Total volume of debris accepted per site may be small • Be sure site is permitted to accept each specific waste steam • Be sure site is on approved waste site list

Table 14-27 Landfarming

Capacity	• Application rates for crude oils are typically 300 bbl/ acre (120 tonnes/hectare) at a rate of 2–3 times/year
Uses	• Disposal of liquids and oil mixed with sand or sediment
Auxiliary Equipment	• Transport truck • Tillers • Fertilizer
Advantages	• Proven method used by hydrocarbon processing plants for many years to dispose of oils and oily sludges • Oil degrades rapidly • Can be implemented quickly
Disadvantages	• Requires large linear surface area • Periodic maintenance is required to fertilize, till, and spread • Not a final disposal option, often used to reduce concentration of oil or to generate a useable product (road base, containment berms at industrial facilities). • There may be significant permitting and regulatory requirements at sites other than existing landfarms
Comments	• Local officials and refinery operators are useful sources of information • The location should be on the contingency plan list of approved facilities • Opportunities to use this strategy are becoming limited due to increased regulation and control

Table 14-28 Open Burning

Disposal Rate	• Depends on the volume of oily waste and debris
Uses	• Disposal of bulky combustible debris such as sorbents, vegetation, and logs
Auxiliary Equipment	• Earth-moving equipment and trucks • Fire-fighting equipment • Air blowers • Smoke suppression chemicals
Advantages	• Useful in remote areas • Eliminates large volumes of waste, residue will still need to be handled. • Can be quickly implemented
Disadvantages	• Air emissions may be a problem • Requires governmental permission in most locations • Can cause contamination of underlying soils • Incomplete combustion may leave residue requiring disposal
Comments	• Burning is often conducted by excavating several ditches and alternately loading and burning in each one • A recommended safety procedure is to cover residue with a layer of dirt to prevent smoldering embers from prematurely igniting the next load being placed in a pit • Air blowers may be required to improve combustion and to control smoke emissions

Table 14-29 Portable Incineration – Offshore Burners (Liquids)

Disposal Rate	• Up to 15,000 bbl (2,400 tonnes) per day
Uses	• Incineration of pure oil and emulsions, either offshore on platforms and barges or on land
Auxiliary Equipment	• A method to mount a burner away from heat-sensitive areas (e.g., tower, boom, or shielding) • Air compressor • Oil pumps (high pressure) and hoses • Water pumps for water shroud • Note: auxiliary equipment may be supplied by manufacturer
Advantages	• Proven method of disposal but may not be available • High rates of disposal doubtful • Useful in remote areas • Can be used to increase the efficiency of burning oil or solid waste materials in the field
Disadvantages	• Requires time to set up (unless already mounted on a platform or barge) including permitting. • Significant amounts of diesel or fuel may be required to reduce viscosity of emulsions to be pumped • Requires debris-free oil or emulsions • May require permit depending on location

Table 14-30 Portable Incineration – Air Curtain Incinerators

Disposal Rate	• Oily debris, up to 1–2 tonnes per hour • Oil emulsions up to 600 bbl (100 tonnes) per day
Uses	• On land disposal of liquids and oily debris
Auxiliary Equipment	• Earth-moving equipment to form earthen incinerator pit • System to load debris or liquids • Above-ground combustion chamber (optional in some cases)
Advantages	• Portable systems for disposal of waste in the field • Medium disposal rates • Permanent disposal of waste will still have residue to address and dispose • Accepts both liquids and solids
Disadvantages	• Requires time to set up and may require permitting
Comments	• Several types of air curtain incinerators are manufactured; some are designed to be used only with above-ground chambers, while others are designed to be used within ground trenches, and some with either.

Table 14-31 Portable Incineration – Rotary Kiln/Other Portable Devices

Disposal Rate	• Oily debris, up to 40–70 tonnes/day • Oiled sediments, 100 tonnes/day (possibly more) • Maximum about 1 tonnes/hour (based on oil content)
Uses	• Disposal near the source of oily sorbents, etc. • Remediation of contaminated soils near the source
Auxiliary Equipment	• Size reduction equipment (shredder or chipper) may be needed, depending on incinerator type and debris size
Advantages	• High disposal rate • Permanent disposal of waste oil and oiled combustibles such as soiled gear and spent sorbents • May accept both liquids and solids
Disadvantages	• Requires time to construct/mobilize • Air emission permit may be needed • Portable ones (not currently in use) may not be an option due to permitting and approvals needed, existing fixed facilities in the theatre of operations are options.

Table 14-32 Commercial Incineration

Disposal Rate	• Up to several hundred bbls/hr (several tonnes/hr)
Uses	• Disposal of both liquids and solids
Auxiliary Equipment	• An efficient storage and transportation network
Advantages	• Permits usually already in place • Quick to implement if close to cleanup site • Safe • Controlled emission release
Disadvantages	• Most incinerators are designed to burn a narrow range of products
Comments	• Incinerators are located at refineries, hazardous waste disposal sites and waste reclamation plants.

Table 14-33 Reprocessing/Recycling

Disposal Rate	• Several hundred bbls/hr (several tonnes/hr)
Uses	• Disposal of debris-free oils and emulsions
Auxiliary Equipment	• None
Advantages	• Oil is recycled
Disadvantages	• Facility must be convenient and permitted
Comments	• Sites that accept oil include refineries, pipeline pump stations, terminals and production facilities • Some locations with oil/water separators can accept debris-free emulsions

Table 14-34 Reclaiming/Recycling

Disposal Rate	• If storage facilities are available at the plant, disposal rates can be high
Uses	• Disposal of oil or emulsions with small amounts of sand, gravel or debris (<5%) • Disposal of weathered oil
Auxiliary Equipment	• None
Advantages	• Oil could be salvaged • Oil could be sold
Disadvantages	• Location must be convenient to cleanup site

14.7 Transportation

Transportation of oil spill wastes as well as waste oil is subject to a variety of regulations in many countries. Placards (special signage) may be required for trucks transporting waste oil. Usually, these placards must comply with regulations that stipulate a symbol, hazard class and number that identify the material. Placards must be clearly visible from the back and sides of the vehicle. Special permits may also be required for transport vehicles, as well as shipping documents/manifests that indicate the type of material being transported. A journey management plan as well as a transportation contingency plan may be part of the regulatory requirements (e.g., preferred routing, emergency contacts, product data, and spill cleanup procedures). In some locations, if a waste spill occurs during transport, a notification to regulatory authorities may be required within a specified time period.

Trans-border disposal is subject to complex regulations and can be conducted after the appropriate authorities have been notified and clearance has been obtained. This may include meeting the requirements of each country involved, including an approved ultimate disposal method/location. Truck drivers and equipment operators transporting wastes should be trained and licensed accordingly. Drivers and operators should review and be aware of any transportation security plans, transportation contingency plans and have a copy of the Material Safety Data Sheet for the oil type if known.

14.8 Material Take Off (MTO) List

In addition to the specific auxiliary equipment items addressed for each type of storage equipment (see Table 14-1), other items are often required to successfully conduct waste management/disposal operations.

Equipment	Use
Dump trucks	Removal of oiled material
Vacuum trucks	Removal of pooled liquid
Garbage cans	Removal of oiled material
Flatbed trucks	Removal of oiled material
Liners	Lining storage containers and storage areas
Protective clothing	Personal protection equipment
Incinerators	Burning of oiled materials
Heavy duty clear plastic bags	Enclosing and segregating waste
Buckets / shovels	Removal of oiled material
Pumps/hoses/connectors	Transfer

15 Spill Response in Cold Regions

15

15.1 Introduction

Response in a cold environment must take into account its unique physical, biological, oceanographic and atmospheric features in developing proper response strategies and contingency plans. Precautions must be integrated into safety plans and training due to inherent dangers of working at low temperatures. Low temperatures can affect the efficiency and effectiveness of both equipment and personnel. Low temperatures resulting in formation of ice can improve or reduce accessibility.

15.2 Safety and Health Considerations

The main safety concerns in cold environments are low temperature, ice, fog, and snow. Proper protective clothing is essential to guard against frostbite and hypothermia (Refer to Section 2.2.3.2 and Table 2-6). Replace any wet clothing and boots as soon as possible. Cold environments also tend to be remote so one should be prepared for the added dangers of travel breakdowns and wildlife. When traveling over cold water by air or sea, cold-water survival suits can extend survival time in the event of accidental immersion. Speed is essential when rescuing a person who has fallen overboard. It is critical that field workers stay in communication with operations and rescue bases.

Other safety and health issues associated with low temperature response are:

- The probability of slips, trips, and falls escalates dramatically with icy surfaces.
- The daylight period in winter is typically short. Adjust work shifts accordingly to allow sufficient time for safe return to the staging area.
- In offshore environments, ice may be dynamic. Conditions can change rapidly and wind shifts may cause ice leads to open and close quickly or shore-fast ice can break and float away.
- Weather patterns can change rapidly. Frequent weather updating is essential.
- Train all workers to recognize symptoms of hypothermia and frostbite (Table 2-6) and to provide appropriate first aid.
- Medical facilities may not be available in remote areas. Teams should arrange for their own medical staff and equipment.
- Low temperatures reduce the rate of volatile emissions. Gases like benzene and hydrogen sulfide may persist longer than normal; however, slower emission rates should reduce their concentration in air.
- Health specialists need to ensure that subsistence fish, shellfish, and wildlife are safe for consumption.
- Exercise care to avoid fire or explosion risks as vapors persist longer. When drilling holes in ice, hydrocarbon gases may be present beneath, especially over an ongoing well blowout or pipeline leak.

15.3 Effects of Low Temperature on Oil

Low temperature affects hydrocarbons in ways that have implications for response:

- Oils with higher pour points can solidify in the cold, which will affect the response strategy. Under certain conditions, solidification could make recovery on land or water easier.
- Oil viscosity increases at low temperature so recovery, burning and dispersion could become more difficult for some oils.
- Loss of light ends (weathering) slows down at lower temperatures, which can offset some of the temperature effect on viscosity. The evaporation rate at 5°C is approximately 1/3 of what it is at 30°C.
- Phenomena that depend on weathering, such as emulsification and tar ball formation, should take longer to occur.
- Biological recovery on shorelines may be slower, though many organisms grow well at near-freezing temperatures. Biodegradation of oil occurs at a somewhat slower rate compared to temperate conditions. Biodegradation is likely to stop if shorelines freeze solid.

15.4 Environmental Factors That Can Affect Cold Region Response

Unique environmental factors—not found in temperate and tropical climates—influence response in cold regions. Some factors have positive effects whereas others will have negative impacts on response strategies and tactics.

15.4.1 Positive Influences on Response

- Cold temperatures slow the weathering process so oils may remain amenable to treatment by recovery, burning, and dispersion for a longer period.
- Cold, viscous oil will spread more slowly providing additional time for response.
- Frozen conditions can facilitate response by providing a solid working platform, reducing the oil's mobility, and providing natural storage capacity for oil on and under ice.
- Snow and ice can be used to contain oil. Snow is also an effective sorbent.
- Water is at or near its maximum density so heavier oils are less likely to sink.
- There is a lower incidence of highly sensitive habitats, such as tidal flats and salt marshes in Arctic regions. Vulnerable times for key sensitivities typically are shorter than in temperate and tropical settings. Therefore, planning protective strategies should be more straightforward.

- Land-fast ice causes significant annual impacts to intertidal biological communities. Concerns about adverse oil spill impacts on intertidal communities are not as much of an issue where land-fast ice occurs in winter and scours shorelines annually.
- Land-fast ice can protect the shoreline from oiling.
- Ice can limit oil penetration on beaches.

15.4.2 Negative Influences on Response

- Oil will be more difficult to recover in dynamic ice-laden waters due to access limitations and safety concerns.
- Thoroughly dry equipment such as pumps, spray booms, and nozzles after use to minimize residual water that can freeze, causing damage or limiting use.
- Diversity of marine biota in colder regions is lower than in warmer regions. Re-colonization may take longer in arctic settings than in temperate or tropical areas.
- Equipment will be more difficult to operate, especially skimmers, in broken ice.
- There is usually poor infrastructure and few roads. Transport of equipment can be a serious challenge.
- Dynamic ice floes can damage booms, vessels, and skimmers.
- Disposal of oily wastes could be an issue in remote and sensitive (e.g., tundra) areas. Wastes may have to be transported long distances. To limit transportation risks, local incineration may be an attractive alternative.
- Shoreline protection strategies may not be possible in broken ice or in the presence of large, moving ice floes.
- The salinity of ice-laden water can vary significantly. Consider this when selecting dispersants whose effectiveness depends on higher salinity.

15.5 On Water Response Options

The development of spill response strategies in cold regions will depend almost exclusively on the season during which a spill occurs. Depending on the time of year, responders could be facing a spill in open water, broken ice, or solid ice. Response considerations for each of these conditions are presented below.

15.5.1 Open Water

Spills in open water in cold regions are treated the same as in temperate and tropical climates. The only difference is the temperature of water and associated safety issues (see Section 15.2).

15.5.1.1 Containment and Recovery

The first step is to identify the spilled oil's physical properties, particularly the pour point. If the pour point is 5–10 degrees above ambient water temperature, there is a strong possibility that the oil has already solidified. Nets and other collection devices will be required for recovery. If the pour point of the spilled oil is below the water temperature, and if currents and wind conditions allow, then booms and skimmers are applicable (see Sections 5 and 9 for selection information).

15.5.1.2 In-Situ Burning

Even if a spilled oil has cooled and is solidifying into a gel, burning should be applicable as long as conditions are appropriate (see Section 8). The oil may be more difficult to ignite at low temperature but once burning begins, it will continue regardless of ambient temperature. Extra igniter fluid or accelerant (e.g., diesel or gelled gasoline) may be needed.. Most crude oils should still be burnable within 2–5 days of the spill and may be burnable for extended periods, as low temperatures will slow weathering.

15.5.1.3 Dispersants

Considerable laboratory, wave basin, and field data exist which indicate that dispersants should be effective in open water conditions even at a low water temperature of 0°C (32°F). While viscosity increases as the temperature drops, effective dispersion may still occur even if the crude oil viscosity exceeds 10,000 cSt. It is important that water temperature should be above the oil's pour point. Most dispersants are formulated to be fluid and spray smoothly even at temperatures below freezing. However, if dispersants are applied using a diluting water carrier, take care to keep the spray boom and nozzles from freezing between uses.

15.5.2 Broken Ice

Periods of seasonal transition occur during early winter freeze-up and spring ice breakup. This ice is likely to be moving, not stationary. Oil spilled into such broken ice will move with the ice. Oil slicks tend to spread far less and remain thicker in broken ice conditions than in open water.

During freeze-up, diminishing open water can exert a time pressure for response. Open water response techniques can be used up to about 30% ice cover but there are limitations of access and safety. In ice concentrations greater than "close pack"

(>60% ice coverage), the sea ice provides a natural containment and can serve to physically limit oil spreading. However, safe access can be limited for vessels, equipment, and responders.

15.5.2.1 Containment and Recovery

Booms are of little or no use in large moving ice floes or in ice concentrations > 30%. Boom material selection is extremely important for durability, with conveyor belting booms being preferable to those made of PVC or polyurethane. Anchoring booms in broken ice can be difficult or impractical and frequent tending is essential once anchored.

Skimmers work best when positioned in open water and in leads between ice pieces. The most appropriate skimmers for ice-laden waters are oleophilic:

- Rope mop
- Sorbent lifting belt
- Brush
- Paddle belt
- Drum

Recovered oily fluid can contain significant amounts of slurry and/or slush ice. Be sure to provide sufficient storage and oil/water separation capacity.

15.5.2.2 In-Situ Burning

Burning is an optimum response strategy for spills in broken ice, subject to the conditions listed in Section 8, and may be the preferred option if it is unsafe to work in or on ice. Deployment of a fire-resistant boom may not be feasible in broken ice. In some cases booms may be unnecessary, as some oil may be contained by the ice. Typically, oil contained between ice leads and along the edges burns at a rate faster than skimmers can otherwise recover it.

In very close pack ice (>90% coverage), ice-breaking vessels can be used to carefully break ice around a spill site to expose trapped oil for burning. Oil in broken ice can be ignited by dropping a torch or flame from a helicopter into pooled oil. Due to reduced evaporation rates, burning in broken ice may be possible for extended periods—up to several months after a spill occurs—particularly if oil is trapped in or below ice in which case evaporation is insignificant.

15.5.2.3 Dispersants

Dispersants can be effective on spills in broken ice if there is some mixing energy present. The pumping action of waves in brash ice and between ice floes can provide the required energy. Tests have shown that bobbing brash ice can actually stimulate dispersant action. However, large pieces of ice and slush and increased ice cover can

inhibit mixing by dampening waves. Vessels can be used to provide added energy by moving through and churning the surface ice and water. Spraying efficiency is likely to be lower than in open water because some dispersant will land on ice. Apply dispersants by air under conditions where mechanical recovery and burning are not possible and in areas deemed too unsafe for workers.

15.5.3 Solid Ice Cover on Water

The formation of solid sea ice over a spill area significantly reduces response options. However, frozen conditions can actually serve to facilitate recovery operations by providing a solid working platform over the oil and by creating natural barriers that can be used to advantage to contain and immobilize oil. Downward-growing ice can quickly encapsulate oil under ice and there will be many in- and under-ice pockets where oil can accumulate in natural depressions, providing access for recovery (Figure 15-1).

Even large spills (tens of thousands of barrels) of crude oil, underneath or on top of solid "shore-fast" ice, could be contained within hundreds of meters from the spill source, depending on under-ice currents and ice roughness. Along the Alaskan North Slope, late winter (April) under-ice storage capacities have been estimated to be as high as 400,000 barrels per km^2 from surveys of fast ice; early winter estimated capacities are about half as much, reflecting smoother underside ice surfaces. However, North Slope offshore waters are relatively shallow and the currents are weak. Under-ice oil retention in higher speed currents would likely be less.

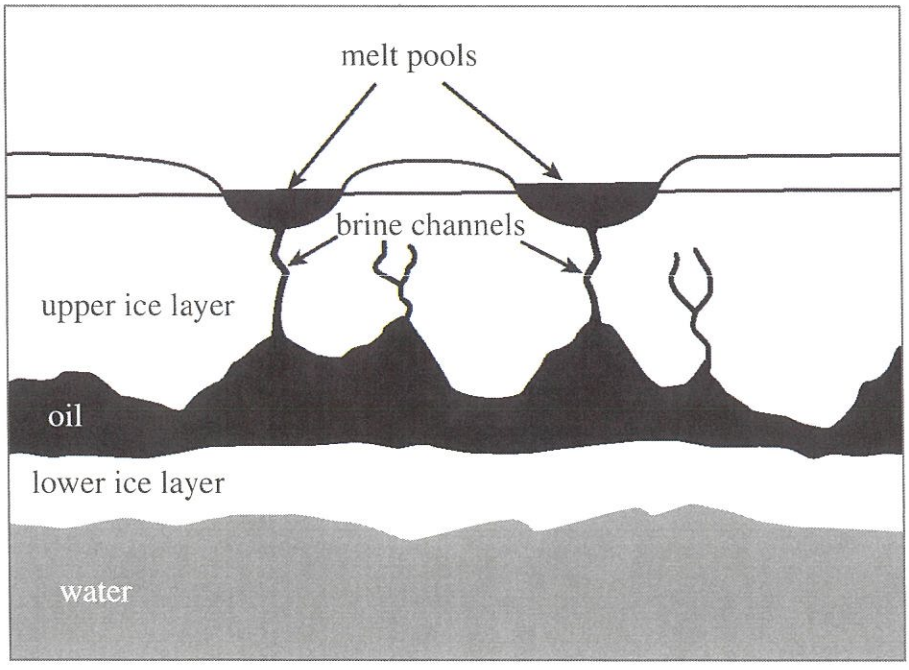


Figure 15-1 Melt Pools and Encapsulated Oil (from EPPR 1998)

15.5.3.1 Containment and Recovery

If the ice is accessible and sufficiently thick to support heavy equipment, ice can be an effective response platform, allowing a number of response options. This is especially true for frozen rivers, streams, lakes and ponds. Use mechanical graders and bulldozers to move snow into the shape of a collection dike and either freeze the snow into ice with water or cover it with an impermeable liner. Dig a trench or series of holes through the ice to reach the oil. Use rope mop skimmers, vacuums or pumps to lift the oil into the temporary storage dike until removal to more permanent storage or treatment and disposal. Cut trenches or holes using ice augers, chain saws, backhoes or a ditchwitch.

15.5.3.2 In-Situ Burning

Burning is a preferred technique for oil spilled on ice and snow-covered surfaces (See Section 15.6). If the release is under ice, then equipment (e.g., ice augers, pumps, ice-breaking vessels) can be used to provide access to it. Once oil has been exposed, it can either be burned in-situ or lifted onto ice surface for burning. Burning is an ideal way to dispose of 90+% of the oil encountered, as long as water content is not too high (maximum 25%), and the oil is of sufficient thickness (2–3 mm). Burning is also a sound approach for oil that rises through brine channels into melt pools in the ice during spring thaw.

15.5.3.3 Dispersants

Dispersants are applicable to oil under ice-cover if the currents and water exchange rates are sufficient to ensure mixing and dilution (minimum 0.5 knot current, but 1.5–3 knots preferred). Add dispersants into the below-ice oil pool or use ice-breaking vessels to bring the oil to the surface and provide mixing needed for dispersion. This could be especially effective if injection were into a steady stream of fresh oil rising from a well blowout under ice. Oil trapped in and under ice remains relatively fresh because the evaporation rates are insignificant, which should help dispersion even after a considerable period. Research is ongoing to develop new dispersant formulations that could keep the dispersants associated with oil for longer periods than presently feasible.

15.6 On Land Response Options

Response to spills on land in colder regions must consider some unique challenges compared to response in more temperate regions. Clearly, if snow and ice are present on the surface, then responders face the same issues and opportunities as for response on frozen seas, but without the challenges of moving ice and breakup periods. Many of the techniques discussed above would apply and the ice can function as an effective barrier preventing the oil from penetrating to the soil below.

Response in snow and ice conditions on land provides opportunities and limitations.

- Snow is a sorptive, porous material and will allow oil spilled on the surface to slowly flow into the snow until it solidifies in place.
- Snow covering a spill to land will be obscured unless responders are fortunate enough to be able to mark slick perimeters before or during a snow event.
- Ice is not particularly porous when oil is spilled on top of it or onto nearly-frozen soil. However, cracks in ice may provide access for spilled oil to slowly flow before it solidifies.

Main response options for spills to snow or ice on land are: mechanical recovery and in-situ burning.

- Mechanical equipment can be used to gather oiled snow and ice for burning or melting prior to oil:water recovery operations.
- Oiled snow with as much as 70% snow by weight can be burned (Figure 15-?)

Any available snow near a spill can be used to advantage by forming snow berms to help contain oil and minimize its spreading prior to removal by mechanical means. If the berm has not completely frozen, it can be lined with polyethylene sheet to fully contain the oil.

Handle spills into lakes using techniques similar to those discussed for open and frozen seas, but note the situation is more straightforward.

- Dispersant approvals are unlikely for such applications.
- If lakes are frozen, ice leads can be opened to provide access to the oil for either recovery or burning.
- The ability to deal with spills into rivers depends largely on the current.
- The principal weapon for these spills is angle booming (or inverted weirs in ice) to divert the oil into pre-determined locations with calm areas (or leads) for containment and removal.

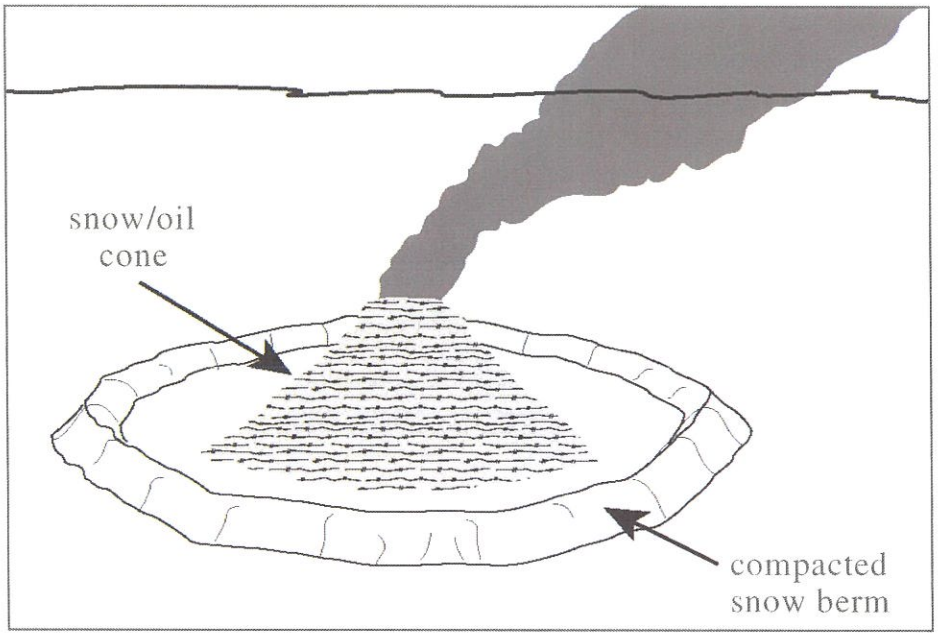

Figure 15-2 Burning Snow Cone (From EPPR 1998)

15.7 Assessment, Mapping, & Tracking

Use experienced specialists to map the oil's location beneath ice. Operational tools to detect or map oil in any ice type are not yet commercially available. Two techniques that hold promise for the future are a high-frequency, ground penetrating radar and an ethane gas sensor. For spills to inland waters, the most reliable means to map a slick is by boring holes in the ice to seek the oil.

- This is a time consuming endeavor and has its own safety risks.
- The current recommended practice is to drill numerous boreholes and then conduct extensive sampling to map the oil location and determine how much is present. Use markers to track the location of the spill as it moves.

Operational tools to remotely detect or map spilled oil in any ice type are not yet commercially available.

Tracking oiled ice offshore or in fast moving rivers will become a priority when active response measures are not possible. Place radio and/or satellite position buoys strategically in the oil deposition zone to monitor ice movements. Place pylons with light strobes on ice floes in the oil slick to assist aerial tracking. Conduct aerial reconnaissance using visual observations and remote sensing devices (e.g., airborne FLIR: forward-looking infrared).

15.8 Cleaning of Oiled Shorelines

Shoreline types in cold regions are not as diverse as in warmer regions. They include:

- Bedrock
- Man-made structures (e.g., drilling platforms and work islands)
- Permanently ice-covered shores
- Sand beaches
- Mixed sediment shorelines
- Pebble/cobble shorelines
- Boulders and riprap
- Scarps and cliffs
- Sand flats
- Mud flats
- Peat
- Inundated lowland tundra
- Salt marshes (not common, but important)

Techniques for cleaning these shorelines are described in Section 12.

Shorelines with high energy and/or frequent ice coverage tend to have low biological diversity and abundance. Biological activity is highest on low energy shorelines and protected pockets occurring in rocky shorelines. In most instances, the presence of ice onshore or in the adjacent near-shore water prevents oil from contacting the shoreline.

For the majority of these shorelines, natural recovery is the preferred clean-up option, except for pockets of very thick heavier oil. Remove these using the least intrusive cleaning methods summarized in Section 12.

In-situ treatment techniques, such as sediment relocation or mixing, may be preferred in remote areas where treatment is considered necessary and where the risk of re-mobilized oil affecting biological resources is low. These treatments minimize waste generation and have been shown to be effective in the acceleration of weathering and, in particular, biodegradation.

Burn pooled oil on shorelines if it is feasible and safe to do so. Oil/snow mixtures are relatively easy to remove, either manually or mechanically. Take mixtures to a heated facility for melting and separation or to a less sensitive area for storage until warm weather can make oil recovery feasible.

The most sensitive time of year for cold region shorelines is during bird migration (June through September) when high concentrations of birds land on beaches, mud flats, and marshes to feed on zooplankton, insects, larvae, and worms. Spills during or prior to this time may warrant accelerated and aggressive oil removal to protect migrating birds. If shoreline cleaning is not possible, employ bird hazing techniques to prevent birds from landing in the more heavily oiled areas (see Section 14).

Finally, peat is an excellent sorbent and is usually plentiful in colder areas. For effective cleaning, only use dried cultivated peat and not the wet peat present on the shorelines. Use oiled peat as a fuel for incineration.

15.9 Response in Permafrost Habitats

In Arctic regions and some sub-arctic regions, the average annual temperature is below 0°C (32°F) and the sub-soil remains frozen. This frozen soil, or permafrost, is typically found under treeless, lichen- and moss-covered plains called tundra. Tundra occurs where

- extreme winter cold and wind, brief cool summers, and shallow continuous permafrost prevent trees from growing.
- the softened ground above permafrost, in summer, contains fauna and flora that if disturbed could take many years and even decades to recover.

Spill response over oiled permafrost during warmer (thaw) seasons must consider the potential traffic impacts from response itself on the tundra. Aggressive response could do more long-term harm than good and the best course of action may be to allow natural recovery. However, such recovery could take a considerable length of time because of the relatively short duration of the growth season. If oil is to be removed during thaw periods, it must be done using techniques such as vacuuming and sorption that will leave the area as undisturbed as possible. In winter, surface soil above the permafrost freezes so one may use conventional land-based response techniques, such as burning, with less concern for physical disruption.

Inundated, lowland tundra habitat occurs in coastal areas which have flooded because of subsidence. Strong onshore winds can lead to flooding of these areas up to 1 meter deep and hundreds of meters inland. This creates a thriving plant and insect community that is an important resource for migrating birds. This habitat, and its communities, is very sensitive to an oil spill and to associated clean-up efforts.

- A spill occurring coincident with strong onshore winds could mean oil deposits well in-land.
- Surface sediments and peat deposits are often water saturated, which will keep spilled oil from seeping into soil. However, oil could remain for some time.
- It may be best to undertake removal only after freezing sets in to minimize damage.

Pipelines are generally not buried in a permafrost layer. If a pipeline above permafrost leaks, then it is likely any spilled oil will either solidify and stay in place (if the oil's pour point temperature is higher than the ambient temperature) or, if still fluid, will flow to some low point where it will accumulate and can eventually be recovered.

16 Aviation Support

16.1 Introduction

The value of aviation is often under-appreciated during contingency planning and response. Aviation (expertise and aircraft) can be used for strategic purposes to provide overflight and surveillance, and tactical purposes including slick targeting, equipment spotting, dispersant spraying, and sometimes for environmental monitoring. It is critical to pre-identify, evaluate, and select aerial logistical infrastructure (airport, fuel, and maintenance shops) during contingency planning.

For small spills, having support of rotary wing aircraft early in a response can maximize the efficiency of response resources. For large spills, having a good understanding of the location of spilled oil and response resources can help ensure a successful operation by providing information to decision-makers who may be far from the incident location. The process of assigning missions for overflight and surveillance, and in support of in-situ burning, mechanical recovery, and dispersant operations requires an understanding of aerial support options.

Our ExxonMobil aviation safety philosophy:

- No air operations without a daily safety briefing and pre-flight briefing form
- Establish a minimum acceptable ceiling and visibility requirements
- Situational awareness of the weather, operational requirements, obstacle data, etc.
- Posting of NOTAMs (Notice To AirMen), as needed
- Debrief of all flights at day's end and a posting of lessons learned.

The following topics will be described in this chapter:

- Use of approved aviation contractors and aircraft
- Strategic planning and coordination
- Aerial observation
- Aerial support for dispersant spray operations
- Aerial support for in-situ burn operations

16.2 Use of Approved Aviation Contractors and Aircraft

Prior to contracting or use of any aviation assets, it is generally required that a company or resource has been evaluated and recommended for use by a qualified aviation advisor or suitably qualified individual. Third-party aircraft should meet standards of safety/technical quality comparable to those of the contracting company. Industry guides are available to provide guidelines outlining minimal aircraft technical and operational specifications.

Consider the following factors when establishing any aviation contractual scope of work (not all inclusive):

- Environmental factors such as climatic conditions, altitude, temperatures, weather, topography, etc.
- Type of typical cargo
- Special equipment (emergency/oil spill response, etc.)
- Training for aircraft crews and personnel to be flown
- Medevac, and search and rescue
- Pilot duty time
- Total anticipated flying time
- Crew rotation schedules
- Airline schedules for crew changes in remote locations
- Personnel transportation frequency and numbers
- Fuel availability and location
- Available support facilities, airports, etc.
- Aircraft availability including back-up aircraft
- Duration of services
- Drug and alcohol programs in compliance with Company policy

16.3 Planning and Roles

16.3.1 Basic Aviation Services Planning

In addition to addressing safety and specific response support roles, aviation plans should address the following:

Communications:

- Frequency allocation plan prevents frequency congestion
- No unnecessary chatter on radios
- Use call signs as opposed to tail numbers
- Obtain weather forecasts and disseminate

Command and Control Structure:

- No air operations to be conducted without approval of aviation advisor or similarly empowered individual
- Coordination and scheduling of aircraft movements and operations.

The decision to use a rotary or fixed-wing aircraft is influenced by a number of factors. Although both platforms are capable of providing an overview, situational-dependent factors may make one more advantageous than the other (e.g., transit time to spill, airport availability, and requirement to stay on-station). Initially, only one type of aircraft could be available and would be used until replacement aircraft can be positioned. Table 16-1 can help make a decision between rotary and fixed-wing aircraft.

Table 16-1 Advantage and Disadvantages of Aerial Platforms

Aircraft Capability Factors	Rotary Wing	Fixed-Wing
Provides overview of locations of interest	+	+
Able to fly slow	+	–
Transit time to spill	–	+
Distance capability	–	+
Time on-station	–	+
Hold on-station (if permitted)	+	–
Level of logistical support (e.g., runway)	+	–

The use of unmanned aerial systems (UAS) is expected to increase as the availability of this technology grows. There are a number of advantages of UASs including safety (i.e., personnel not on board, operational flexibility) and generally decreased logistical requirements. UAS operators will need to meet regulatory requirements for approval to operate, pilot training, operations manual, etc. It is recommended that an aviation advisor review UAS operations.

16.3.2 Aviation Support Roles

16.3.2.1 Aviation Advisor or Air Operations Branch Director

Industry aviation advisors can assist in recommending specific aircraft types which are preferred, as well as contractors that are qualified to provide a particular service. To provide necessary additional specifications for the local area and anticipated operating plan, qualified aviation advisors should be used to technically review bid proposals as well as final bid submissions. During a response, they can assist with guidance on:

- Separation of aircraft by altitude
- Lateral separation distance
- Flight paths
- Restricted airspace

16.3.2.2 Local Aviation Contact

It is recommended that those responsible for managing a spill response should identify an individual to serve as the primary local aviation contact, who is familiar with local resources (e.g., airports, aviation assets, etc.) and state/federal regulations. The local aviation contact will provide aviation stewardship and liaise with unified command, the air operations branch director or a suitably qualified aviation advisor, and any aviation services contractors. The local aviation contact:

- Should have direct interface with the Operations section;
- Interfaces with the contract administrator for related contractual matters. The aviation contact typically approves aircraft flight schedules and the dispatch of aircraft; and
- Typically oversees local aviation operations, and passes operational, technical or safety related queries to the appropriate individual within the air operations structure (e.g., air operations branch director or a aviation advisor).

16.3.2.3 Aerial Observer

The information provided by trained observers is critical to response and as such it is important to use trained observers who have experience in identification, distribution, and quantification of spilled oil. The efficiency of mechanical recovery, in-situ burning, and dispersant application can be directly influenced by the accuracy of information from an aerial observer since it will be provided to response management or command center staff for strategic decision-making. Terminology and codes have been developed to provide a consistent manner of reporting spilled oil appearance and distribution during a response.

16.3.2.4 Spotter

It is important to use trained spotters who have experience in identification and quantification of spilled oil to help direct tactical operations. The efficiency of mechanical recovery, in-situ burning, and dispersant application can be directly influenced by the accuracy of targeting information from a spotter since it is important to focus efforts to those areas with the highest concentration of oil. Familiarity with natural conditions which may mimic appearance of spilled oil can limit the frequency of false positive and false negative identifications.

16.4 Aviation Support

Information compiled through use of aviation assets supports the tactical deployment of mechanical recovery, dispersant, and in-situ burn operations. For more complex incidents it can be prudent to conduct periodic overflights to assess slick conditions and locations. This may include flights early in the morning to confirm the movement of the spilled oil on water overnight.

16.4.1 Mechanical Recovery Operations

Aviation assets and services can be provided for spill incidents on land and on water. In many responses, mechanical recovery is the primary response option utilized due to a number of factors such as size of spill, the state of oil weathering, location, type of oil, equipment or response assets available. Depending on the size of an incident and ease of access for responders for spills on land, the use of aviation support may be beneficial to assess distribution, locations of thickest oil, and/or access points for response operations which would otherwise be unknown. For spills to surface water, aviation support may be beneficial to assess distribution and locations of thickest oil (Figure 16-1).

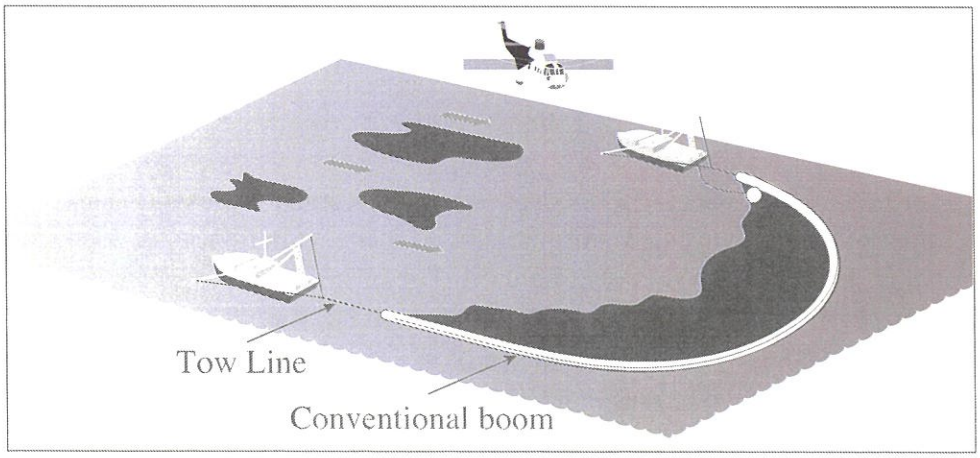

Figure 16-1 Rotary wing aircraft can provide details and guidance to operations on where the larger quantity of oil is located

16.4.2 Aviation Support of Surface Dispersant Operations

Frequently aircraft are used for oil spill dispersant spray operations. When more than one aircraft is responding, the formulation of an aviation plan is advisable. The basic plan below is a template for modification to meet local situations (Figure 16-2).

DISPERSANT MISSION PRE FLIGHT BRIEFING FORM

The following topics should be addressed during a daily pre-flight mission briefing and included in flight packets to be given to each flight crew scheduled for duty.

1. Safety of flight
2. Weather
3. Location of activities - Latitude/Longitude
4. Control Points, Routes - Latitude/Longitude
5. Altitude assignments
6. Frequency allocation
7. Assignment of call signs
8. Filing of flight plans
9. Refueling locations
10. Schedule of activities
11. Restricted airspace
12. NOTAMS

16.4.3 Aviation Support for In-situ Burn Operations

Primary aerial support for in-situ burning includes targeting the slick and then to ignite the vapors of spilled oil. This section focuses on the use of a heli-torch which can be used on spilled oil on water or land (Figure 16-4).

16.4.3.1 Heli-Torch Operations:

General Considerations:

- An In-Situ Burn Operations Group Supervisor or similarly qualified individual typically has the overall responsibility for a successful burn and develops a burn plan
- The best technique is for the pilot to use vertical reference (VR) on the torch
- Use of a long line is mandatory
- Use of a bubble window or removal of the pilot window is encouraged
- Management of rotor wash is very important, as the downwash can extinguish the flames

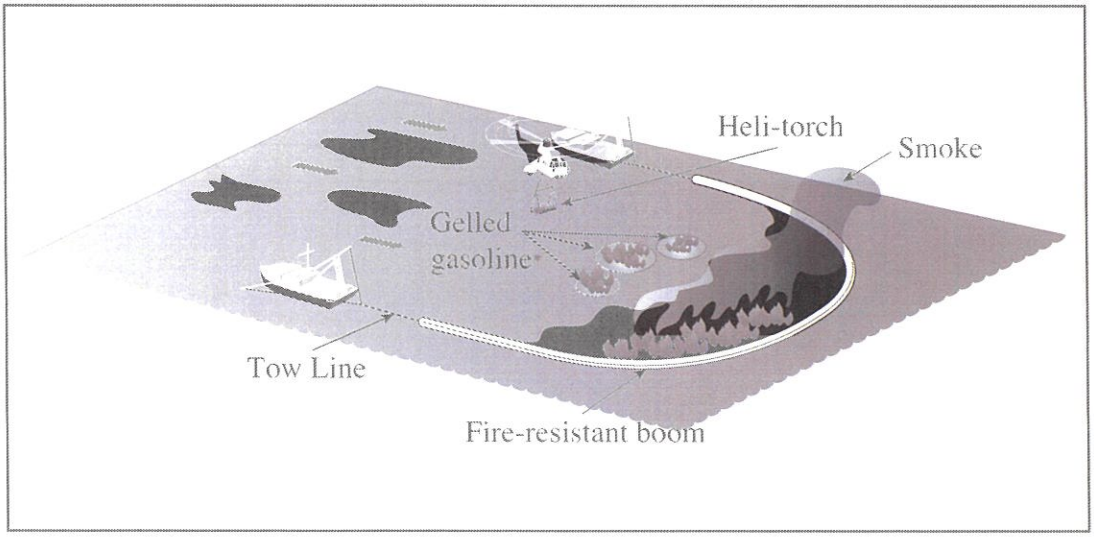

Figure 16-4 In-Situ Burn Operation using a helicopter and heli-torch

NOAA's Office of Response and Restoration

NOAA's Office of Response and Restoration (OR&R) is a center of expertise in preparing for, evaluating, and responding to threats to coastal and marine environments, which may include oil and chemical spills, releases from hazardous waste sites, and marine debris. OR&R is comprised of three divisions: Emergency Response, Assessment and Restoration, and Marine Debris.

To fulfill its mission of protecting and restoring the nation's coastal and marine ecosystems and resources, OR&R:

- Provides world-class scientific and technical support to prepare for and respond to oil and chemical releases.
- Determines injuries to natural resources from spills and other hazards, then seeks damages for restoration to make the public whole.
- Protects and restores marine and coastal ecosystems, including coral reefs.
- Works with communities to address critical local and regional coastal challenges.

Shoreline Assessment Manual

1 An Introduction to the Shoreline Cleanup Assessment Technique (SCAT)

When spilled oil contaminates shoreline habitats, responders must survey the affected areas to determine the appropriate response. Although general approvals or decision tools for using shoreline cleanup methods can be developed during pre-spill planning stages, responders' specific treatment recommendations must integrate field data on shoreline habitats, oil type, degree of shoreline contamination, spill-specific physical processes, and ecological and cultural resource issues. Cleanup endpoints must be established early so that appropriate cleanup methods can be selected to meet the cleanup objectives. Shoreline surveys must be conducted systematically because they are crucial components of effective decisions. Also, repeated surveys are needed to monitor the effectiveness and effects of ongoing treatment methods (changes in shoreline oiling conditions, as well as natural recovery), so that the need for changes in methodology, additional treatment, or constraints can be evaluated. This manual outlines methods for conducting shoreline assessments and incorporating the results into the decision-making process for shoreline cleanup at oil spills, all a part of the Shoreline Cleanup Assessment Technique (SCAT) program.

In spite of the word "shoreline" in SCAT, a SCAT program can be applied to any type of response, be it oil, chemical (depending on the safety issues), or marine debris, and in any type of habitat, be it along shorelines, wetlands, lakes, rivers, streams, or uplands. Thus, everywhere in this manual where the word "shoreline" is used, it could easily be replaced with the appropriate habitat for a specific incident. SCAT was implemented during responses to the 2010 spills into the Kalamazoo River, Michigan and the Yellowstone River, Montana with good results.

The SCAT program has become an integral component of spill response since the *Exxon Valdez* spill, which was the first spill where standard approaches for documentation, terminology, and decision-making were applied (Owens and Teal 1990). Since then, many organizations have developed SCAT programs, manuals, field forms, job-aids, and training courses. In North America, Environment Canada and the National Oceanic and Atmospheric Administration (NOAA) Office of Response & Restoration (OR&R) have developed similar SCAT programs and associated products.

Many improvements to SCAT were developed during the response to the 2004 *Selendang Ayu* spill in Alaska (Crosby et al. 2008; Owens et al. 2008) and the 2007 M/V *Cosco Busan* spill in San Francisco Bay, including the introduction of Shoreline Treatment Recommendation (STR) forms and the proto-type SCAT database. During the *Deepwater Horizon* oil spill, up to 26 SCAT teams, consisting of Federal, State, local, and BP representatives, conducted field surveys to document the location, degree, and character of shoreline oiling using standard methods and terminology for over three years. As of May 2013, this effort involved over 7,100 SCAT team-days during which 7,058 kilometers (km) of shoreline were surveyed; however, over 46,000 km of total shoreline have been surveyed, because of the many repeated surveys of the same sections of shoreline over time. A robust SCAT database and reporting tools were refined and became essential to managing the data from this large SCAT effort.

During a spill response, SCAT is an integral component of the response organization that is conducted as part of the Incident Command System (ICS). Further information regarding ICS, response structures, and roles can be found in the US Coast Guard Incident Management Handbook (USCG 2013). The SCAT function in a typical ICS structure fits into the Planning Section under the Environmental Unit (EU) with strong interaction with the Operations Section (Figure 1). SCAT teams are often made up of representatives from state and federal agencies, the Responsible Party (RP), and the U.S. Coast Guard (USCG) or U.S. Environmental Protection Agency (USEPA) as the Federal On-Scene Coordinator (FOSC). Members of the team should be trained and knowledgeable in their roles, which include 1) SCAT Coordinator, 2) SCAT Team Leader, 3) SCAT Team Member, and 4) SCAT Data Manager. In some cases, there will be a need for a SCAT-Ops Liaison and a SCAT Logistics Coordinator. The NOAA Scientific Support Coordinator (SSC) is a principal advisor to the FOSC, per the National Contingency Plan. The NOAA SSC and Scientific Support Team are trained and experienced in planning, conducting, leading, training, and coordinating all aspects of SCAT.

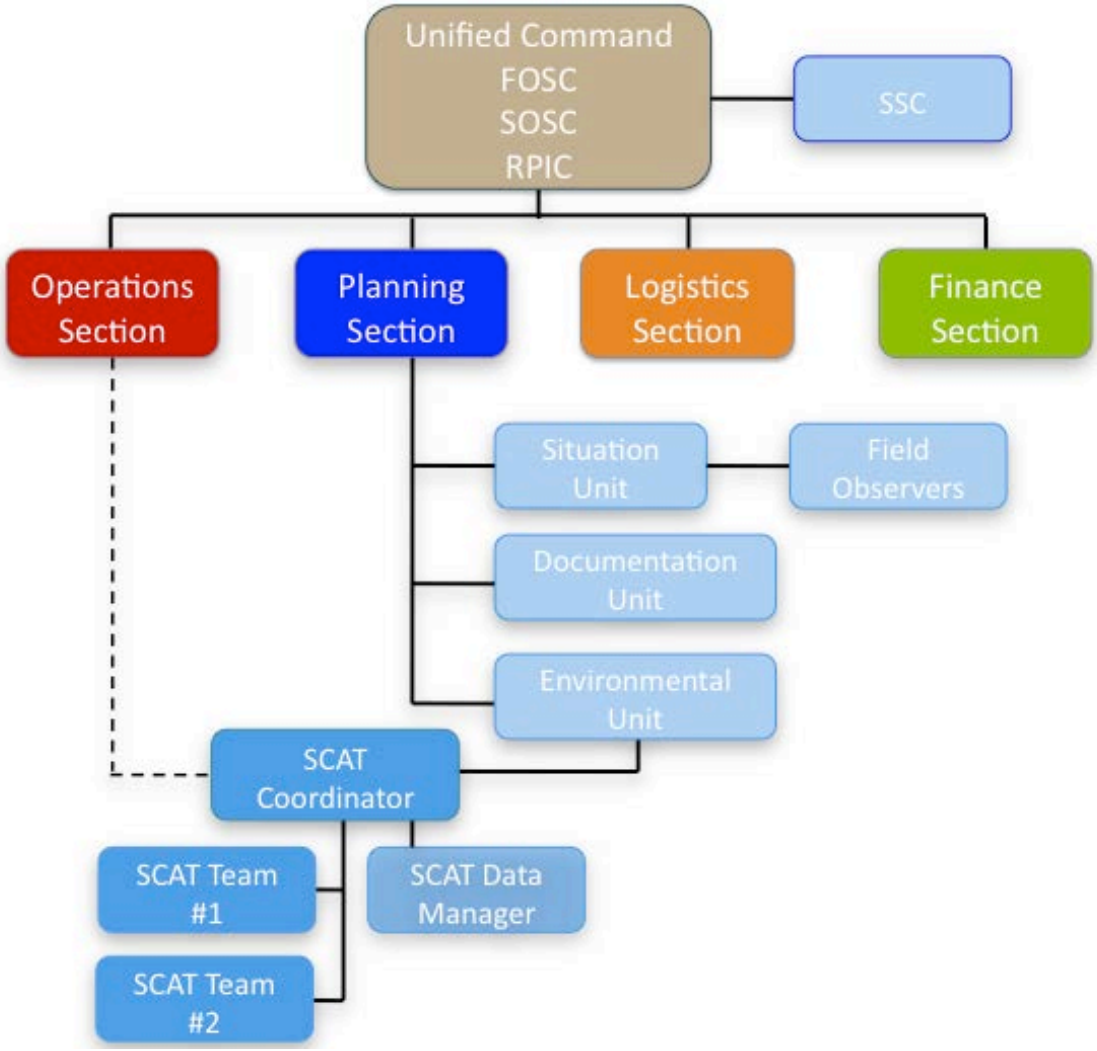

Figure 1. The Unified Command Structure of ICS. SCAT Teams work as part of the Environmental Unit to collect information on shoreline oiling conditions to support cleanup decision-making.

Bringing their organization's expertise, SCAT Team Members collect the data needed to develop a shoreline cleanup plan that maximizes the recovery of oiled habitats and resources, while minimizing the risk of injury from cleanup efforts. Consideration should always be given to:

- Potential for human exposure, by direct contact or by eating contaminated seafood;
- Extent and duration of environmental impacts if the oil is not removed;
- Natural removal rates;
- Potential for remobilized oil to affect other sensitive resources; and
- Likelihood that cleanup could cause greater harm than the oil alone.

Information from these assessments must meet the requirements of the cleanup operation, being both timely and of uniform quality and content. Finally, the teams must coordinate their field activities with the Operations Division supervisors working in the areas being assessed. This ensures that all operations are conducted safely and that important information is exchanged.

Information generated by SCAT is critical to spill response and is used throughout the planning and operational process (Figure 2). The SCAT Coordinator synthesizes field data into reports used by the EU and Planning Section to support the daily Incident Action Plan (IAP). The information and recommendations are reviewed and approved by the Planning Section and implemented by the Operations Section in shoreline cleanup. SCAT supports the response objectives and mandates of the response operations, as directed and managed by the Unified Command (UC). Appropriate representatives from all stakeholders in the response are involved in this activity. Shoreline assessment data must be collected quickly since it is necessary for operational decision making.

The following sections of this manual describe the organizational and technical aspects of conducting shoreline assessments. This manual is designed for use as a field guide as well as a training tool. NOAA has developed training programs for SCAT Team Members and Coordinators/Team Leaders that covers much of the material in this manual, as well as other technical topics that SCAT Team Members need to be able to perform their duties, including introduction to Environmental Sensitivity Index (ESI) maps, coastal processes, oil types and behavior, case studies, oil behavior and cleanup on different shoreline types, and field exercises to practice doing SCAT surveys. NOAA and USEPA have developed a similar three-day training program for Inland SCAT, using examples and case studies from inland spills.

General Process of SCAT Support to Operations

The SCAT Process begins as soon as the threat of shoreline oiling is identified. The following discussion outlines the basic SCAT process (Figure 3), keeping in mind each component is scalable to meet the needs of the incident. Reconnaissance is conducted to identify the shoreline types, extent (both along-shore and cross-shore) of oiling, and logistical requirements for deploying field teams. Teams are organized and trained, maps and spatial data on sensitive resources and shorelines are compiled, and initial cleanup guidelines and endpoints are developed. Based on the priorities to support Planning and Operations Sections, SCAT teams conduct the initial shoreline survey and complete the Shoreline Oiling Survey (SOS) forms. The results are evaluated using the cleanup guidelines (allowable shoreline treatment methods for different shoreline types and degree of oiling) and cleanup

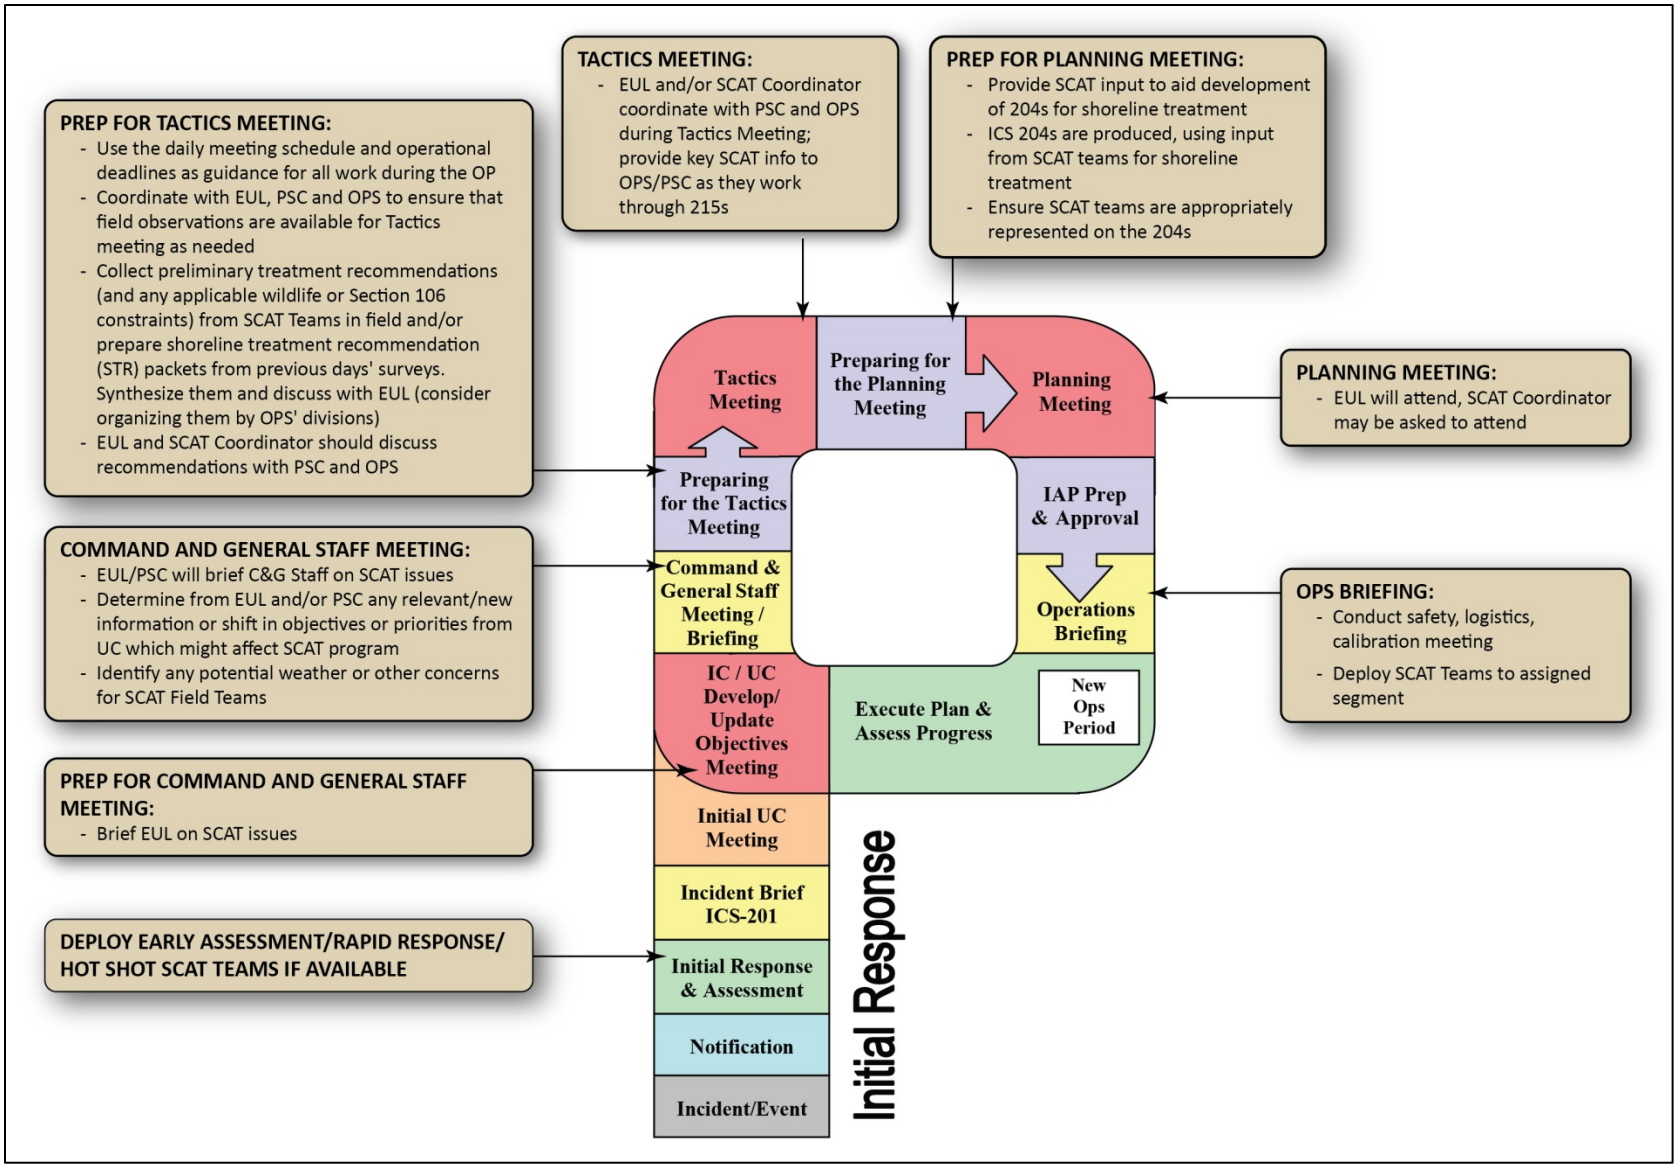

Figure 2. Where SCAT-generated information is used in the "Planning P" process (from Northwest Area Committee, 2013).

endpoints (when treatment operations can be terminated), and each shoreline segment is assigned one of three categories: 1) No oil observed (NOO); 2) No further treatment (NFT) recommended; and 3) Treatment recommended, which results in the preparation of a STR. Cleanup endpoints should be included as part of the STR. The draft STR is reviewed by appropriate agencies and stakeholders, including required consultations under federal regulations, and submitted for final approval by the UC before submittal to the Planning Section for issuance to the Operations Section as part of the Incident Action Plan.

Note that the terms cleanup and treatment are used interchangeably. Shoreline treatment does not always remove all the oil, so that the shoreline is "clean," so sometimes treatment is the preferred term. However, they both mean the same thing.

During cleanup activities, SCAT teams respond to requests from the Operations Section to clarify the STR requirements and provide guidance on best practices. The Operations Section notifies SCAT when a segment is deemed ready for inspection against the current cleanup endpoints. If SCAT determines that the segment does meet the cleanup endpoints, they recommend it for final inspection and signoff. If not, they recommend continued treatment, which can include creation of a new or revised STR. Eventually, all shoreline segments, including those that were initially determined to be NFT, are subject to final inspection or review and signoff. A Shoreline Inspection Report (SIR) can be used to document the oiling conditions prior to moving a segment out of the response.

Information Needs Early in the Response

In the initial phase of a spill, the conditions may require immediate information on shoreline oiling to deploy cleanup contractors for gross oil recovery. The UC can direct Field Observers, who are organized under the Situation Unit (Figure 1), to gather such information. As well as knowing accepted terms and cleanup guidelines, Field Observers must understand the key agency concerns about a spill, such as the shoreline sensitivity or special resource issues, (e.g., protected species or cultural resources), that need to be considered during any type of shoreline cleanup operations.

Companion Job-Aids to this Shoreline Assessment Manual

NOAA has generated a series of job-aids that should be considered companion documents to this manual. These include:

- **Shoreline Assessment Job-Aid:** A pocket-sized, laminated field guide used by members of Shoreline Assessment Teams to assist them in recording accurate field observations in a concise, systematic, and standard format.
- **Characteristics of Response Strategies: A Guide for Spill Response Planning in Marine Environments:** A pocket-sized field guide that summarizes the technical rational for selecting response methods and describes shoreline treatment methods in terms of their objectives, descriptions, applicable habitats, when to use, biological constraints, environmental effects, and waste generation.
- **Characteristic Coastal Habitats: Choosing Spill Response Alternatives:** A pocket-sized guide that illustrates typical physical and biological attributes of coastal habitats.

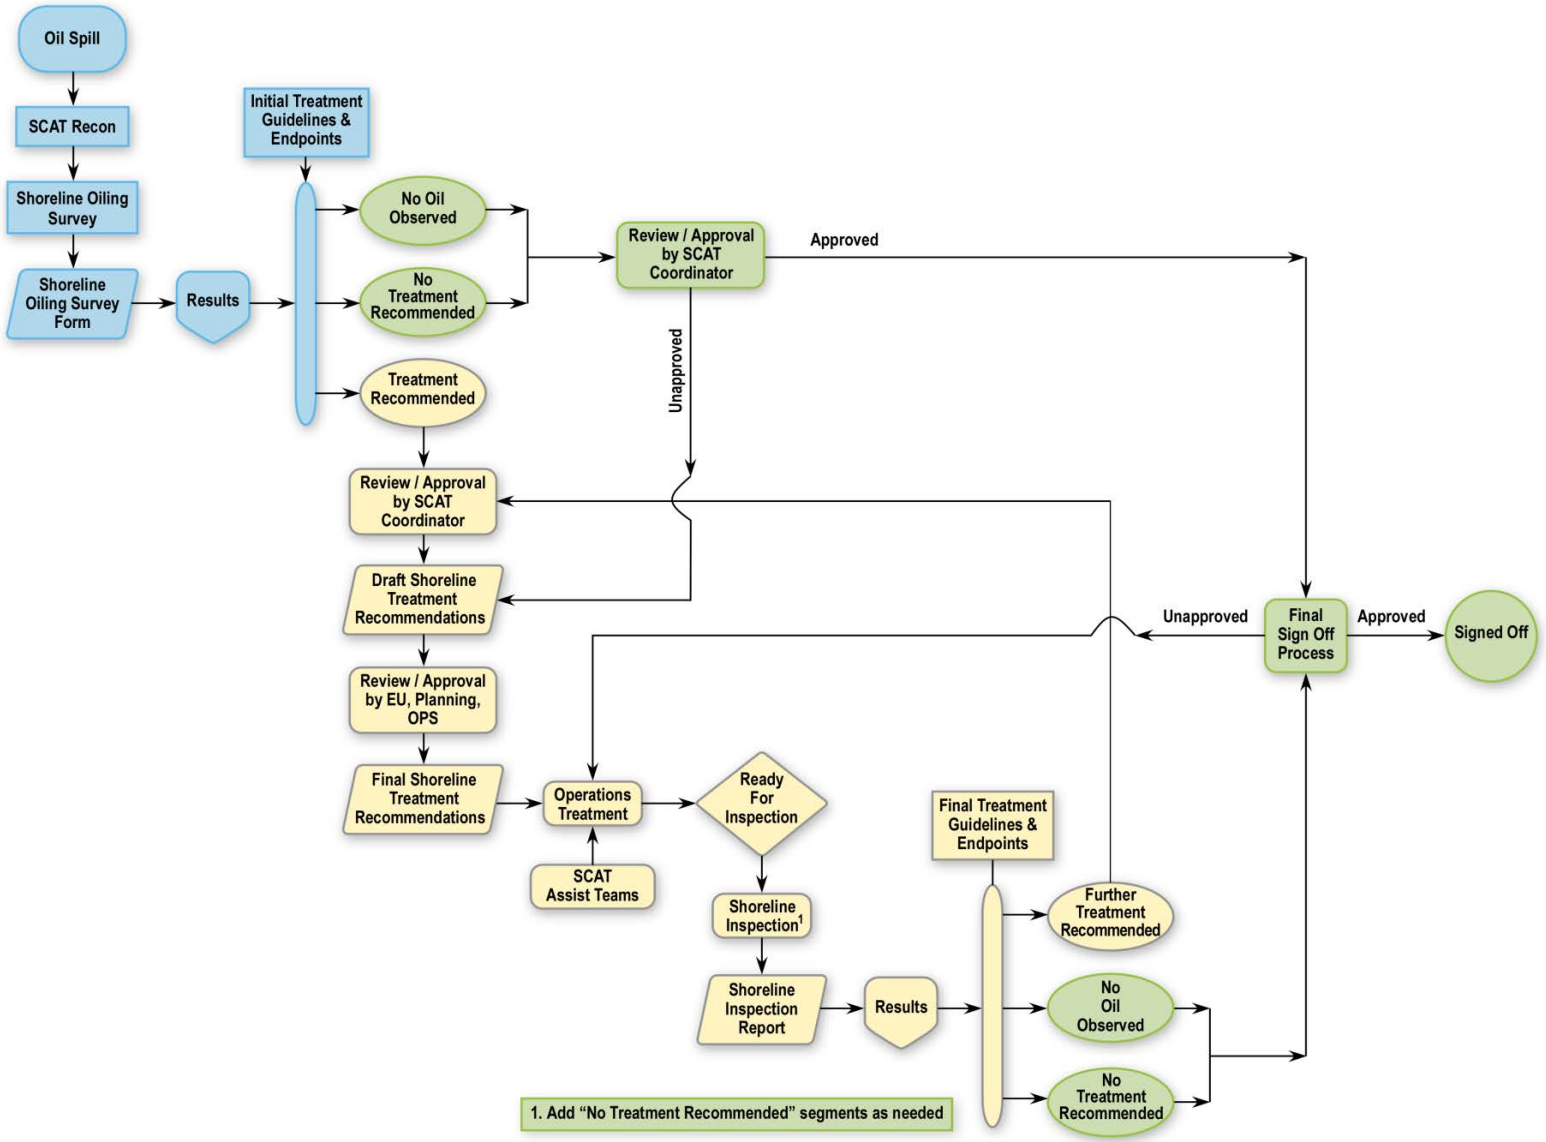

Figure 3. SCAT process flow chart.

2 The Flexibility of Shoreline Assessment Methods

What is a SCAT Program?

- It is a systematic approach that uses standard terminology to collect data on shoreline oiling conditions and support decision-making for shoreline cleanup;
- It is flexible in terms of scale of the survey and detail of the data sets collected;
- It is multi-agency, with trained representatives from all stakeholders, who have authority to make decisions; and
- It provides a clear organizational framework that links the SCAT process to both cleanup decision-making and logistical coordination.

The SCAT process should be easily modified to fit the spill conditions; it should be as simple as possible, yet comprehensive enough to address all of the issues and concerns of shoreline cleanup. It must not be a slow, cumbersome process that keeps decision-makers waiting for key data. Two types of SCAT are outlined below, representing a range of complexity. Many spills will require some elements of both: detailed surveys of specific problem areas, and application of general guidelines for cleanup of shorelines with simple cleanup requirements.

"Geographic" SCAT

This assessment approach generates site-specific recommendations on resource protection and cleanup methodology.

Involves…

- Completing forms, segment maps, and/or sketches for each segment;
- Photodocumenting oiling conditions; and
- Making detailed treatment recommendations unique to each segment, identifying specific locations to be cleaned.

Is used for…

- Very small spills where all sites can be readily inspected by the same team;
- Very large spills where many teams are required;
- Sites where many different shorelines types have been oiled; and
- Areas where full documentation of oiling conditions is required, such as:
  - Spill conditions where cleanup problems are not readily apparent (e.g., buried oil that must be located by digging, or when repeated surveys are needed to ensure that removal is complete); and
  - Areas with resource constraints that need to be specifically identified in the field.

"Topical" or "Hot Spot" SCAT

This assessment approach is appropriate when the degree of oiling is relatively uniform or uncomplicated, or when the shoreline type is not particularly sensitive, such as man-made structures. The cleanup guidelines should be detailed enough to prevent confusion about their use. Terminology

used in the guidelines should reflect local usage (e.g., use "seaweed" rather than "brown algae" or "*Fucus*" if that is what the cleanup workers call it). Box 1 is an example of general cleanup guidelines.

Box 1:
Guidelines for Hot-Water Flushing of Oiled Riprap/Bulkheads

- Water temperature not to exceed 120°F.
- Spray nozzle will be held at a distance of 5 inches or greater from the surface. All spraying/flushing will be into water for collection.
- No attached seaweed will be sprayed with hot water.
- Once the water level reaches the seaweed, hot-water flushing will be terminated.
- Once hot-water washing is terminated, all released oil will be recovered immediately. Cold-water flushing of the seaweed is allowed when oil has accumulated in it.
- Removal of heavily oiled seaweed will be allowed in specific areas identified by SCAT. If seaweed is to be cut, the root attachment and a 30-cm stem will be left.
- Cold-water flushing will be conducted until no more oil is mobilized.
- Hot-water flushing will be repeated until no free oil is released by the hot wash and no more than a stain (cannot be scraped off with a fingernail) remains on the surface.
- Sorbents will be deployed along areas where sheens are being released from the shoreline.

NOTE: *The guidelines will be revised, as needed, in response to changing conditions as the oil weathers.*

Involves…

- Conducting familiarization surveys by the team to identify oiling conditions and cleanup issues for each shoreline type or resource of concern;
- Developing spill-specific cleanup guidelines for each shoreline type, to be implemented in the field;
- Meeting with cleanup supervisors to make sure that the cleanup guidelines are understood, what leeway they have in implementing them, and the key issues of concern to the resource agencies;
- Spot-checking cleanup operations for compliance with cleanup guidelines and effectiveness toward achieving target cleanup endpoints; and
- Responding to requests to resolve "hot spot" problems encountered during cleanup activities.

Is used for…

- Small-volume spills that spread over very large areas (e.g., widespread stranding of tar balls on beaches);
- Man-made shoreline types, such as seawalls, with few site-specific sensitive ecological or cultural resource issues; and
- Cleanup work that continues for a very long time because of chronic re-oiling or seasonal changes in shoreline oiling.

Response Typing as Part of the SCAT Process

Under ICS, the USCG classifies incidents as to their complexity using a 1-5 Type scale, so that their personnel have the appropriate training to handle the responsibilities required of them during an incident (Figure 4). Type 5 is limited to one operational period and one responder; Type 4 is limited to one operational period and multiple responders. SCAT is unlikely to be required for these types of incidents. Types 1-3 may extend into multiple operational periods and involve increasingly complex organizational structures. NOAA has adopted a similar Incident typing approach in its SCAT planning, training, and response. This concept uses the flexibility of the SCAT process to consistently scale SCAT skills, organization, methods, and products appropriately to a specific spill's requirements. The primary objectives are to:

1) Guide procedural SCAT needs for varying response complexity;
2) Specify appropriate tools;
3) Identify useful and/or required products; and
4) Provide the basis for developing guidelines for NOAA SCAT personnel and equipment requirements for on-scene and home team support.

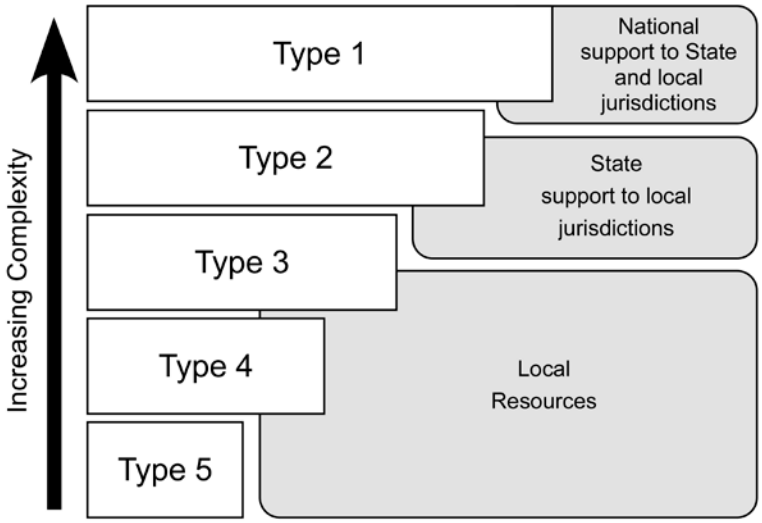

Figure 4. U.S. Coast Guard Response Types.

Factors that NOAA considers when determining spill complexity include:

- Spill volume and type of product released (especially if unusual or dangerous)
- Spatial extent of oiling (e.g., number of miles or acres affected)
- Number, sensitivity, and complexity of shoreline types potentially affected
- Estimate of duration of SCAT surveys needed (days vs. weeks vs. months) and complexity of SCAT data management
- Number of SCAT teams needed or assembled
- Uniformity/complexity of oiling
  - Multiple zones of oiling within segments prevalent vs. one continuous band

    - "3-dimensional" oiling (e.g., oiling on stems or branches of marsh/mangrove/forested wetlands)
- Spill conditions
    - Are oiling conditions difficult to visualize (e.g., buried or sunken oil)?
    - Are oiling conditions rapidly changing?
- Are weather, rough conditions, or other factors a hindrance to the SCAT process?
- Spill source changes, such as acute or chronic re-oiling incident(s), unknown source(s), or oiling changes due to weather (severe weather, extreme heat) or seasonal changes
- Logistical constraints to shoreline access (remoteness, accessibility, tidal range)
- Resource concerns that need to be specifically confirmed in the field
    - Threatened/Endangered species nesting and use of designated critical habitat
    - Migratory/spawning concentrations
    - Cultural resource considerations
- Recreational or industrial use of the oiled shorelines, seasonal use factors
- Commercial, recreational, and/or subsistence consumption of resources
- Degree of cooperation among the RP and Natural Resource Trustee agencies

[1]A **Type 3** SCAT effort is most appropriate when some of the following factors occur:

- The volume of spilled oil is small (e.g., <10,000 gallons)
- The spatial extent of oiled shoreline is small (e.g., <10 miles)
- The majority of shoreline types are not particularly sensitive (e.g., manmade or sand beaches)
- Time required to survey entire impacted area is short (e.g., 3 days)
- Only 1-2 teams are required and assembled
- The degree of oiling is uniform or uncomplicated
- Logistical access for SCAT surveys is simple (e.g., easily accessible by foot or boats)
- Few site-specific sensitive resource issues identified
- SCAT data can be managed by one person
- Cooperation and consensus between Trustees and RP is easily met (or no known RP)

A **Type 2** SCAT effort is most appropriate when some of the following factors occur:

- The volume of spilled oil is moderate (e.g., 10,000-100,000 gallons)
- A small-volume spill spreads over very large areas (e.g., tar balls)
- The spatial extent of oiled shoreline is moderate (e.g., > 10 miles and < 100 miles)
- Time required to initially survey entire impacted area is two weeks or less
- No more than 4 teams are assembled at first; this number may diminish down to 2 as the initial survey is completed
- The degree of oiling is fairly uniform and uncomplicated, but there are some hot spots or problem areas
- Logistical access for SCAT surveys is simple to moderate (e.g., accessible by foot or boat; need for some easily accessible equipment like 4-wheel drive trucks or airboats)

[1] Specifics from a particular event may fall within more than one incident type over space or time.

- There are some sensitive resource issues or shoreline types that can mitigated with moderate effort
- There is recreational (particularly high season) or industrial use of an area that is impacted
- SCAT data are more complex, requiring more than one data manager
- There is reasonable cooperation and consensus amongst and/or between Trustees and RP
- Resource, shoreline, or cleanup issues emerge in a "Type 1" spill that complicate the situation and require additional time and effort

A **Type 1** SCAT effort is likely most appropriate when some of the following factors occur:

- The volume of spilled oil is large (e.g., > 100,000 gallons)
- The product spilled is unusual or dangerous
- The spatial extent of oiled shoreline is large or complex (e.g., over 100 miles, hundreds of acres of broken marsh)
- Time required to initially survey entire impacted area is lengthy (2-4 weeks or longer in some cases)
- Four or more SCAT teams are needed daily for multiple weeks
- The degree of oiling is complicated and lacks uniformity due to multiple shoreline types or other factors
- Spill conditions exist where cleanup problems are not readily apparent (e.g., buried or submerged oil)
- Cleanup work continues for a very long time because of acute or chronic re-oiling or changes in shoreline oiling due to weather or other factors
- Logistical issues for SCAT teams
- Working in remote areas with long daily travel times or strenuous hiking/access (e.g., Aleutian Islands, rocky coasts of California)
- Accessible only by air or sea
- Extensive broken marsh subject to tidal changes making accurate assessment and mapping difficult
- Traveling in urban areas with traffic constraints
- Resource concerns that need to be specifically identified in the field are numerous
- Threatened/Endangered species nesting in impacted areas
- Large numbers of animals congregating seasonally (e.g., wintering waterfowl, fish spawning)
- Cultural resource considerations
- Recreational (particularly high season), industrial, or tourist areas are impacted
- High-value real estate or property are oiled
- Potential degradation of a "pristine" environment or one heavily relied upon for consumptive use (subsistence, commercial, or recreational)
- SCAT data are very complex, requiring a large data management team
- Relationships amongst and/or between Trustees and RP are contentious

3 Responsibilities of the SCAT Team

As SCAT Teams represent the "eyes and ears" of the Unified Command in the field, they have the following responsibilities:

- Describe shoreline types, oiling conditions, and physical setting
- Identify sensitive resources (ecological, recreational, cultural)
- Determine the need for cleanup
- Recommend shoreline cleanup methods and endpoints:
  - Specify generic and site-specific constraints for cleanup activities
  - Determine the need for follow-up surveys if archaeological and cultural resources are present
  - Establish cleanup priorities
  - Identify safety concerns for cleanup operations
  - Monitor cleanup effectiveness and effects, suggesting changes where needed
  - Determine when cleanup operations are no longer effective
  - Conduct post-cleanup inspections before sign-off

Teams must answer these questions:

- Is cleanup necessary at this segment?
- Which cleanup methods are appropriate or recommended?
- Which constraints are needed to protect sensitive resources?
- What is the priority for cleanup at this segment?
- Are cleanup operations being conducted properly?
- Is the cleanup method no longer effective, or causing collateral damage? Do we need to try another method?
- Does the segment meet the cleanup endpoints?

SCAT data need to be collected efficiently and the results provided to the Unified Command in a timely manner.

4 Roles and Responsibilities of the SCAT Program Members

The SCAT Program usually consists of a Coordinator, Team Leaders for each team, Team Members, and Data Managers. For large, complex responses, there may be a need for a SCAT-Ops Liaison and a SCAT Logistics Coordinator. Responsibilities and NOAA's position qualification guidelines for each member are outlined below. Other organizations may have different position qualification guidelines.

SCAT Coordinator

Responsibilities:

ICS Responsibilities

- Serve as the primary point of contact for all SCAT activities, both at the Incident Command Post and in the field
- Participate in Planning Section meetings
- Recommend the need for and number of SCAT Teams
- Participate in development of incident-specific Cleanup Endpoints; Continue to lead evaluation of targeted cleanup endpoints, modifies them as necessary, and coordinate with the Unified Command for approval
- Develop a reporting schedule to produce survey results in time for incorporation into the Incident Action Plan
- Prepare interim daily summaries of SCAT activities and results, for use in briefing during daily Planning Section meetings
- Obtain briefing information and special instructions from Environmental Unit Leader, and/or SCAT Team Leaders and shares information as appropriate
- Brief the response management team on issues raised by the SCAT, particularly where cleanup methods must be modified to increase effectiveness or decrease impacts
- Coordinate with other members of the response effort to optimize data sharing, including the NRDA team, Operations, and Planning
- Integrate cleanup concerns of the various resource agencies and managers into the decision-making process
- Generate and make sure all SCAT team members sign the incident-specific Site Safety Plan

SCAT Team Management Responsibilities

- Conduct reconnaissance survey to scope the shoreline oiling issues
- Oversee the creation of shoreline segments for collection of SCAT data
- Conduct or coordinates refresher training for SCAT teams prior to field deployment
- Ensure that all teams have the necessary expertise and stakeholder representation
- Develop daily assignments for each team and provides a daily safety briefing prior to team deployment
- Ensure that teams use proper terminology and apply guidelines uniformly and are properly calibrated
- Arrange for logistical support for the SCAT Teams

- Possess overall responsibility for ensuring that all members have the necessary training, field gear, and safety equipment
- Ensure availability of critical field information, including weather, tides, and key phone numbers (e.g., safety, wildlife operations, 3rd party claims, Joint Information Center, etc.)
- Ensure that all SCAT field teams are present and accounted for
- Work to achieve consensus among SCAT members on treatment recommendations, priorities, constraints, etc.; reports dissenting opinions when consensus is not reached
- Generate and make sure all SCAT team members sign the incident-specific Site Safety Plan

SCAT Information Management Responsibilities

- Optimize SCAT data collection (forms and process), management, and reporting to support operational decisions
- Identify sensitive resources and shares information with SCAT teams
- Receive reports from field teams and synthesizes them into a daily summary
- Ensure that field-collected data are accurate and appropriately presented for use in the Incident Command Post
- Oversee the generation of all SCAT products, including shoreline oiling and cleanup stage maps and tables, sites of special concern maps and tables, shoreline treatment recommendations and priorities, and shoreline inspection reports
- Monitor effectiveness of cleanup

NOAA Position Qualification Guidelines:

- Has completed the SCAT Team Coordinator/Team Leader training course
- Has current HAZWOPER certification
- Has completed the following NIMS training courses: ICS-100, ICS-200, ICS-300, ICS-700, and ICS-800
- For all NOAA personnel, must have the most current required training dictated by NOAA policies
- Has knowledge of coastal ecology, coastal processes, and/or geology
- Is aware of regional protocols and the Area Contingency Plan
- Has SCAT experience from at least five different spills
- Has experience with weather forecasts to make decisions on team safety while in the field
- Has experience in developing cleanup guidelines and endpoints for different shoreline types
- Is familiar with effective management, facilitation, and conflict resolution skills

Special Considerations:

- NOAA recommends that the SCAT Coordinator role be filled by a public agency representative if possible
- On small spills, the NOAA SSC often fills the role of SCAT Coordinator

SCAT Team Leader

Responsibilities:

- All SCAT Team Member responsibilities
- Ensure that field gear for SCAT teams (maps, photography equipment, GPS, communications, etc.) are adequate and assembled prior to deployment
- Ensure that field gear and safety equipment are maintained by SCAT Team Members and reports any problems to the SCAT Coordinator
- Review each SCAT segment assigned to their team prior to deployment for issues such as access sites (vehicle, boat, helicopter), problematic terrain (streams, cliffs), special safety considerations, communications, limitations, etc.
- Manage the team while it conducts field surveys
- Act as the team Safety Officer
- Make sure that the forms and sketches are 100% completed in the field
- Guide the team toward consensus on treatment recommendations, priorities, special constraints, etc., and notes dissenting opinions
- Brief the SCAT Coordinator and other SCAT Leaders on field survey results
- Aware of Best Management Practices that are inplace
- Record cleanup issues and any other spill-specific issues identified by the team that need to be addressed
- Determine need for additional expertise to address specific sites, i.e., archaeologist, geomorphologist, response cleanup experts, etc.
- Provide quality control of field-collected data for use in the Incident Command Post
- Recommend to SCAT Coordinator modifications to cleanup methods and target cleanup endpoints based on SCAT Team recommendations
- Can serve as Deputy SCAT Coordinator, if required
- Manage and assist with field documentation of observed oiling conditions and/or record photo/waypoint details
- Obtain briefing information and special instructions from Environmental Unit Leader, and/or SCAT Team Coordinator, and shares information as appropriate.
- Read and sign the incident-specific Site Safety Plan
- Perform other tasks as defined by the SCAT Coordinator
- Generate and make sure all SCAT team members sign the incident-specific Site Safety Plan

NOAA Position Qualification Guidelines:

- Has completed SCAT Team Coordinator/Team Leader training course
- Has current HAZWOPER certification
- Has participated as a member on a SCAT in at least two significant responses
- Has completed the following NIMS training courses: ICS-100, ICS-200, ICS-700, and ICS-800
- For NOAA personnel, has the most current required training dictated by NOAA policies
- Has knowledge of the coastal ecology, processes, and/or geology of the affected area

- Has experience in evaluating cleanup methods for different shoreline types
- Is proficient with operating a Global Positioning System (GPS) unit, including collection, upload, and download of waypoints and track lines and selecting datum and coordinate formats (see SCAT GPS Guidelines in Appendix H)
- Is proficient with operating a digital camera, including setting the correct date and time (see SCAT Photography Guidelines in Appendix G)
- Knows proper sampling methods and how to maintain chain of custody of samples
- Has experience conducting field surveys
- Knows how to download images captured in the field and organize them based on standard protocols

SCAT Team Member

Responsibilities:

- Assist in data collection on shoreline types, oiling conditions and special considerations
- Recommend site-specific constraints or precautions to be followed during cleanup
- Recommend need for cleanup, considering cleanup guidelines and endpoints, site safety, and sensitive resources
- Recommend shoreline cleanup methods, priorities, and endpoints considering cleanup guidelines, site safety, and sensitive resources
- Assist with field documentation of observed oiling conditions (e.g., record photos, waypoints and related details)
- Ensure that field gear and safety equipment are maintained and reports any problems to the SCAT Leader
- Monitor effectiveness of cleanup
- Identify and be aware of sensitive resources and shares information with other SCAT members
- Work to achieve consensus among SCAT Team Members on treatment recommendations, priorities, constraints, etc.
- Obtain briefing information and special instructions from SCAT Coordinator and/or SCAT Team Leader
- Read and sign the incident-specific Site Safety Plan
- Is responsible for personal safety

NOAA Position Qualification Guidelines:

- Has current HAZWOPER certification
- Has completed the following NIMS training courses: ICS-100, ICS-200, ICS-700, and ICS-800
- Has completed formal SCAT training, preferably a 3-day course
- For NOAA personnel, has the most current required training dictated by NOAA policies
- Has a general knowledge of the coastal ecology, coastal processes, and/or geology

- Is proficient with operating a GPS, including collection, upload, and download of waypoints and track lines and selecting datum and coordinate formats (see SCAT GPS Guidelines in Appendix H)
- Is proficient with operating a digital camera, including setting the correct date and time (see SCAT Photography Guidelines in Appendix G)
- Is proficient with downloading images captured in the field and organizing/labeling them
- Understand proper sampling methodologies and chain of custody protocols

SCAT Data Manager

Responsibilities (see also Chapter 7):

- Assist the SCAT Coordinator in optimizing SCAT data collection (forms and process), management, and reporting to support operational decisions
- Modify existing SCAT data entry forms as needed (working with SCAT Coordinator)
- Review daily SCAT forms for completeness and consistency
- Enter or supervise the entry of daily SCAT data
- Conduct data quality assurance/quality control (QA/QC); identifies common data problems and trains SCAT members how to prevent future problems
- Generate daily summary reports (database-generated) of shoreline cleanup status, maps (hard copy, KMZ, PDF) of shoreline cleanup status, and specific data summaries determined by the SCAT Coordinator and Incident Command
- Maintain an archive of all SCAT data (e.g., forms, photographs, GPS data, etc.)
- Provide access to all SCAT data entry forms and field manuals to Incident Command
- Is prepared to work odd and extended hours
- Read and sign the incident-specific Site Safety Plan
- Is aware of health and safety issues for a particular work site
- Manage field team photographs using appropriate database and protocols
- Manage field team GPS data using appropriate software

NOAA Position Qualification Guidelines:

- Has the ability to set up and maintain hardware and software needed for response
- Has completed the following NIMS training courses: ICS-100, ICS-200, ICS-700 and ICS-800
- Has completed Introduction to SCAT training course (familiar with SCAT terminology)
- Is proficient in use of commonly used spreadsheet software (e.g., Excel)
- Is proficient in use of database software to manage SCAT data
- Knows how to operate a GPS, including collection of waypoints and track lines, selecting datum and coordinate formats, and download data to computer
- Is proficient in use of commonly used GIS software (e.g., ArcGIS)
- Is skilled in creation of output files in various formats (e.g., Google Earth KMZ files)
- Has general knowledge of relational database structures

- Know how to operate a digital camera, set the correct date/time and organize photos based on SCAT protocols
- Is proficient in use of commonly used photo georeferencing software (e.g., GPS PhotoLink, OziPhoto, OziExplorer)
- Has general knowledge of QA/QC procedures
- Has the ability to diagnose/troubleshoot hardware/software/networking issues
- Is proficient in standard spatial data directory structures, file naming conventions
- Can delegate work to and manage additional SCAT information management team members, if required

SCAT Data Management Team

Responsibilities (see also Chapter 7):

- Assist with producing daily status maps showing current SCAT deployments and assessment activities; maintain archive copies for distribution and reference
- Assist with obtaining weather from NOAA sources and post and print for morning ops briefings
- Assist with managing and QA/QC SCAT Teams' GPS tracklogs and waypoints from GPS units and digital photos; process with appropriate software tools (e.g., OziExplorer, GPS Photo Link, HoudahGeo)
- Assist with making SCAT maps available in all appropriate formats, including hard copies, PDFs, and Google Earth KML/KMZ files

NOAA Position Qualification Guidelines:

- Has the ability to set up and maintain hardware and software needed for response
- Has completed Introduction to SCAT training course (familiar with SCAT terminology)
- Is proficient in use of commonly used spreadsheet software (e.g., Excel)
- Is proficient in use of commonly used database software (e.g., Access)
- Know how to operate a GPS, including collection of waypoints and track lines, selecting datum and coordinate formats, and download data to computer
- Is proficient in use of commonly used GIS software (e.g., ArcGIS)
- Is skilled in creation of output files in various formats (e.g., Google Earth KMZ files)
- Know how to operate a digital camera, including setting the correct date and time and organizing photos based on SCAT protocols
- Is proficient in use of commonly used photo georeferencing software (e.g., GPS PhotoLink, OziPhoto, OziExplorer)
- Has general knowledge of relational database structures
- Has general knowledge of QA/QC procedures
- Has the ability to diagnose/troubleshoot hardware/software/networking issues
- Is proficient in standard spatial data directory structures, file naming conventions

SCAT-Ops Liaison

For large, complex responses, SCAT teams will be very busy conducting surveys and may not have the time to work in the field with Operations Supervisors as shoreline cleanup begins. Under these conditions, a SCAT-Ops Liaison position may be created, particularly during the early phase of the response. This position should be filled by experienced responders who understand both SCAT and shoreline cleanup operations.

Responsibilities:

- Be the link between SCAT and Operations to make sure that Operation Supervisors understand the shoreline treatment recommendations, how they should be interpreted, and best practices for implementation
- Meet with the Operations Supervisors in each Operations Division to discuss the shoreline treatment recommendations and clarify any misunderstandings
- Visit each work crew to observe operations and answer questions about methods
- Discuss with the SCAT Coordinator any issues raised by the Operations Section
- Document daily activities with a daily report that includes photographs of the operations and any issues that need to be addressed

SCAT Logistics Coordinator

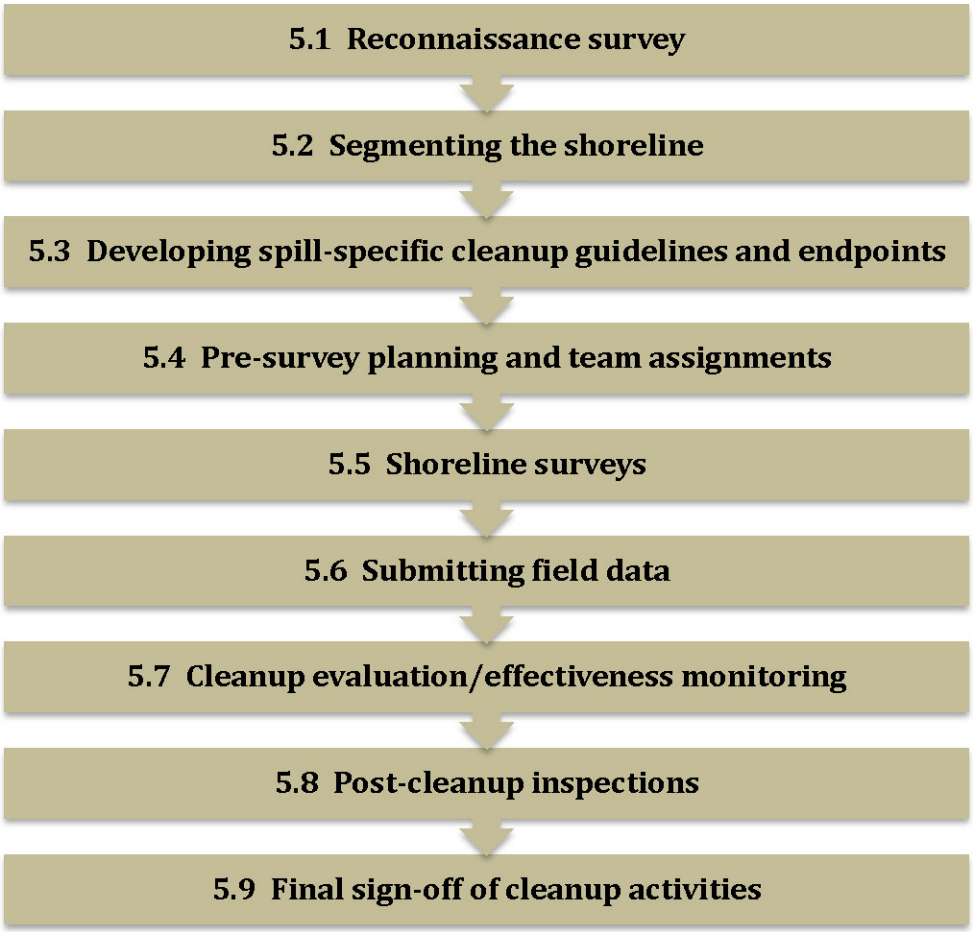
For responses that require complex logistics to get SCAT teams into the field, making all the logistical arrangements is a full-time job. A Logistics Coordinator will be essential to making sure that the teams have the resources needed to get to their assigned segments, including field and safety gear, boats, aircraft, and vehicles.

Responsibilities:

- Develop a daily tasking plan for all SCAT teams. This plan should extend out several days and be posted on white boards for all to review. This information is to include team number, team members by organization, location name and segments to be surveyed, departure time, and any special instructions
- Prepare and submit ICS-213 resource request forms to order any resources needed, such as type of boats or aircraft, vehicles, and field and safety gear, in time for these resources to be ordered to meet the tasking plan
- Track the status reports from the teams in the field, particularly when they depart/arrive back to the deployment area (e.g., marina, airport)
- Repair/replace field and safety gear returned by the teams
- Attend the daily SCAT debrief to learn of any logistical or safety issues so they can be resolved

5 Shoreline Assessment Process and Activities

The following sections describe the full range of activities normally conducted as part of the shoreline assessment process for the steps outlined below.



The degree to which each activity is implemented depends on the complexity of the spill. Flexibility is important; activities should be modified as appropriate to specific spill conditions. Yet every SCAT Program should contain these basic activities.

Various resources and tools have been developed to assist SCAT Coordinators, Team Leaders, and Team Members in conducting each of these activities. These tools and resources are briefly summarized below.

Shoreline Assessment Job-Aid: A pocket-sized, laminated field guide used by members of Shoreline Assessment Teams to assist them in recording accurate field observations in a concise, systematic, and standard format. It consists of color photographic examples of all shoreline assessment terms, shoreline types, and cleanup methods. NOAA produced the Job-Aid in 1998 and updated it in 2007. Laminated hardcopies are available for purchase and electronic copies are available for download at: http://response.restoration.noaa.gov/sites/default/files/jobaid_shore_assess_aug2007.pdf

Characteristics of Response Strategies: A Guide for Spill Response Planning in Marine Environments: A pocket-sized field guide that summarizes the technical rational for selecting response methods and describes shoreline treatment methods in terms of their objectives, descriptions, applicable habitats, when to use, biological constraints, environmental effects, and waste generation.Prepared by NOAA in 2000 and updated in 2010. Hardcopies are available at no costs and electronic copies are available for download at: http://response.restoration.noaa.gov/sites/default/files/Characteristics_Response_Strategies.pdf

Characteristic Coastal Habitats: Choosing Spill Response Alternatives: A pocket-sized guide that illustrates typical physical and biological attributes of coastal habitats at risk from oil spills. For each of 18 shoreline types, it includes a sketch, description, predicted oil behavior, response considerations, and the response method table. It is a useful aid for training people who will be participating in Shoreline Assessment surveys. Prepared by NOAA in 2000 and updated in 2010. Hardcopies are available at no cost and electronic copies are available for download at: http://response.restoration.noaa.gov/sites/default/files/Characteristic_Coastal_Habitats.pdf

Environmental Sensitivity Index (ESI) Maps: Provide detailed data on shoreline habitats, sensitive biological and human-use resources, and life-history data on biological resources. The latest ESI maps can be downloaded at: http://response.restoration.noaa.gov/maps-and-spatial-data/environmental-sensitivity-index-esi-maps.html

Open Water Oil Identification Job Aid for Aerial Observation: Field guide to assess the character and extent of oil spilled on the water. It was updated in 2012. Laminated hardcopies are available for purchase and soft copies are available at: http://response.restoration.noaa.gov/sites/default/files/OWJA_2012.pdf

International Tanker Owners Pollution Federation Limited (ITOPF) Technical Information Papers (TIPs): A series of seventeen papers that describe technological advances and ITOPF's more recent collective experience on a wide range of marine pollution topics. Each paper covers a specific subject in a concise manner, illustrated with photographs and diagrams. Available at: http://www.itopf.com/information-services/publications/

In addition, shoreline assessment manuals have been developed by Environment Canada, CEDRE, and the United Kingdom, as listed in the references cited.

5.1 Reconnaissance Survey

Objectives

- Obtain overall perspective on shoreline types and degree of contamination in the area of impact.
- Determine areal extent of oiling on the shoreline.
- Identify logistical constraints to shoreline access for both shoreline assessment and cleanup teams.

Responsibility

- Usually conducted by the SCAT Coordinator, although someone with local-area knowledge can also be a valuable participant.

Methods

- Should be conducted in the first day or two of the incident and as oil expands into new areas.
- Review maps to become familiar with area and resource concerns.
- It is best to conduct an aerial survey, but it could also be conducted by vessel, vehicle, or foot.
- Develop a flight plan of the area to be surveyed and brief the pilot on the survey objectives, flight line direction (so that the key observers have direct view of the shoreline), likely duration, and special requirements such as flight altitude.
- Fly entire impact area (~400 feet altitude at a maximum of 100 miles per hour) in helicopter or high-wing aircraft. Schedule the flight during low tide to view maximum extent of potentially oiled shoreline.
- Use GPS and topographic maps or nautical charts to record:
    - Flight path, including date and time;
    - Objective descriptors of shoreline oiling conditions[2];
    - Location of floating oil, possibly affecting shoreline oiling conditions;
    - References to photographs/video taken; and
    - Access points for survey teams, especially in remote areas.
- After the aerial survey, compile your observations, tracklines, photographs, etc. into a report to share with other SCAT personnel. Select key photographs, particularly of oiled areas needing immediate response, to brief Operations and Planning.
- Visit representative ground sites to confirm and scale the degree of shoreline impacts and note special problems, such as potential for burial of oil, which could affect cleanup decision planning.

[2] Objective oiling descriptors (Chapter 6, Figure 6) must be modified according to observations made during the reconnaissance survey.

5.2 Segmenting the Shoreline

Objective

- Divide the shoreline into operational working units, called segments, for recording and tracking survey data and making treatment recommendations.

Responsibility

- Can be completed in the command post by the SCAT Coordinator or workgroup using maps, or in the field by SCAT Teams. Local-area knowledge will be valuable.
- Some areas already have pre-segmented shorelines identified in their Area Contingency Plan.

Methods

- Generate base maps from digital databases or aerial imagery.
- Mark segments based on similarity of geomorphology (refer to ESI maps), degree of oiling, or the boundary of an Operations zone; local staff familiar with the area should be involved.
- Segment boundaries should be readily recognizable in the field.
- Size segments appropriate to spill conditions and total area of impact (often 0.2 to 2.0 km long). Because separate forms are completed for each segment, the interval should not be so small that the number of forms required becomes unmanageable for the size of the spill.
- Use divisions or zones already in use by cleanup operations, when possible. Develop the segment-naming scheme with the Operations Section so it is most useful. SCAT segments should not include multiple Operations work zones.
- Consider the logistics for deploying cleanup crews when segmenting the shoreline. For example, segment boundaries along a uniform shoreline (e.g., long sand beach) could be between two access points.
- For long uniform shorelines select a fixed length, such as 500 m, and mark with stakes or flags
- Pre-number segments with alphanumeric code (e.g., BI-9 for segment number 9 on Block Island; or A-1 for the first segment in cleanup zone A). Remember that the spill responders may not be familiar with local geographic names.
- When segmenting a river shoreline, river miles and river bank (e.g., left or right descending) are often used to delineate each segment.

As an example, on the eastern end of Galveston Island, Texas (Figure 5, top), the parks are different segments because of their special management status, the Gulf beaches are segmented based on access routes, and the other segments are based on shoreline type. For inland spills, oil often spreads laterally and contaminates habitats over larger areas, such as in a floodplain, rather than forming a relatively narrow band along a shoreline. In these cases, SCAT teams may define segments as areas or polygons, as shown in Figure 5 (bottom) for the 2010 spill into the Yellowstone River, Montana. It may be difficult to determine appropriate boundaries between segments in areas of thick vegetation. SCAT teams need to be flexible and have more creativity when surveying under these kinds of conditions. Up-to-date aerial photographs will be essential to determine locations and mark boundaries. Use of GPS in track mode will also be essential for documenting the actual areas surveyed.

Figure 5. (top) Example of shoreline segmenting. (bottom) Example SCAT segments for the 2010 Yellowstone River spill; note the need for polygons where the oil spread into the river floodplain.

5.3 Developing Spill-Specific Cleanup Guidelines and Endpoints

Endpoints are selected based on general cleanup objectives, which are to: 1) minimize exposure hazards for human health; 2) speed recovery of impacted areas if possible; and 3) reduce the threat of additional or prolonged natural resource impacts. These objectives lead to developing cleanup strategies that do not cause more harm to the environment than good.

Ideally, cleanup efforts will return the resource to its baseline condition without suffering further impact or affecting other resources. Aggressive and inappropriate cleanup techniques can make matters worse. Less intrusive methods or natural recovery are often preferable. The best cleanup strategy is often not the one that removes the *most oil*; rather, it is the strategy that removes oil that poses a greater risk of injury than would result from cleanup, and allows remaining oil to be removed by natural processes.

Objectives

- Guide the Operations Section in conducting specific *cleanup methods* to minimize adverse environmental impact.
- Provide the Operations Section with environmental and safety constraints on conducting cleanup activities in *specific habitats*.

Responsibility

- SCAT Coordinator, agency staff, major landowners, and Team Leaders.

Methods

- *A more detailed discussion of how to develop cleanup endpoints follows this bulleted list.*
- Develop spill-specific cleanup objectives, guidelines, and target endpoints. Refer to the Characteristics of Response Strategies Job-Aid that describes cleanup methods. Cleanup methods are usually generated for each shoreline type that is oiled. Appendix C describes the ESI shoreline types (see Table 1), expected oil behavior, and general response considerations. Guidelines for shoreline cleanup endpoints that can be used as the basis for developing the spill-specific cleanup endpoints are provided in Table 2.
- Evaluate proposed cleanup methods for potential habitat or resource effects.
- Identify time-critical and degree-of-use issues to be combined with cleanup priorities and endpoints.
- Identify sensitive resources that may be adversely affected by the proposed treatment methods (e.g., rich intertidal biota on rocky shores where low-pressure ambient-water flushing will be used). Consult with the NOAA National Marine Fisheries Service (NMFS) and U.S. Fish and Wildlife Service (USFWS) about compliance with Section 7 of the Endangered Species Act (ESA). See Box 2 for a summary of the process to make this determination during an emergency response.

- Consult with NOAA's National Marine Fisheries Service to comply with regulations to protect Essential Fish Habitat under the Magnuson-Stevens Fishery Conservation and Management Act.
- Determine if there are Historic Properties (such as archaeological or cultural resources) in the area of operations that could be disturbed by cleanup activities. See Box 3 for the process to make this determination during an emergency response.
- Discuss among stakeholders the trade-off issues between the desire to remove all the oil versus the potential impacts associated with intensive treatments. Consider natural removal processes and the timing of habitat use. Even the presence of cleanup workers can disturb wildlife such as marine mammals at haulout sites and nesting birds and sea turtles.
- Write operational guidelines to minimize adverse impacts (e.g., restrict flushing operations to times when the rich biota zones are underwater). Date the guidelines in order to track revisions.
- Conduct field trials and evaluate new methods or equipment to determine effectiveness and potential adverse effects.
- Observe actual operations to confirm the method's use, i.e., that the cleanup is effective and is not more damaging than the oil alone.
- Modify cleanup guidelines as the oil changes from weathering, rendering the technique ineffective, or when unacceptable impacts occur under actual use.

Table 1. ESI shoreline types for three habitat settings. The color scheme for the ESI classifications is shown in the first column.

ESI NO.	ESTUARINE	LACUSTRINE	RIVERINE
1A	Exposed rocky shores	Exposed rocky shores	Exposed rocky banks
1B	Exposed, solid man-made structures	Exposed, solid man-made structures	Exposed, solid man-made structures
1C	Exposed rocky cliffs with boulder talus base	Exposed rocky cliffs with boulder talus base	Exposed rocky cliffs with boulder talus base
2A	Exposed wave-cut platforms in bedrock, mud, or clay	Shelving bedrock shores	Rocky shoals; bedrock ledges
2B	Exposed scarps and steep slopes in clay		
3A	Fine- to medium-grained sand beaches		
3B	Scarps and steep slopes in sand	Eroding scarps in unconsolidated sediments	Exposed, eroding banks in unconsolidated sediments
3C	Tundra cliffs		
4	Coarse-grained sand beaches	Sand beaches	Sandy bars and gently sloping banks
5	Mixed sand and gravel beaches	Mixed sand and gravel beaches	Mixed sand and gravel bars and gently sloping banks
6A	Gravel beaches (granules and pebbles)	Gravel beaches	Gravel bars and gently sloping banks
6B	Riprap	Riprap	Riprap
7	Exposed tidal flats	Exposed tidal flats	
8A	Sheltered scarps in bedrock, mud, or clay	Sheltered scarps in bedrock, mud, or clay	
8B	Sheltered, solid man-made structures	Sheltered, solid man-made structures	Sheltered, solid man-made structures
8C	Sheltered riprap	Sheltered riprap	Sheltered riprap
8D	Sheltered rocky rubble shores		
8E	Peat shorelines		
8F			Vegetated, steeply-sloping bluffs
9A	Sheltered tidal flats	Sheltered sand/mud flats	
9B	Vegetated low banks	Vegetated low banks	Vegetated low banks
9C	Hypersaline tidal flats		
10A	Salt- and brackish-water marshes		
10B	Freshwater marshes	Freshwater marshes	Freshwater marshes
10C	Swamps	Swamps	Swamps
10D	Scrub-shrub wetlands; Mangroves	Scrub-shrub wetlands	Scrub-shrub wetlands
10E	Inundated low-lying tundra		

Table 2. Guidelines for development of cleanup endpoints. Use these guidelines to develop spill-specific cleanup endpoints for terminating active cleanup.

No Oil Observed (NOO): Not Detectable by Sight, Smell, Feel	This endpoint is often used for sand beaches where oil removal can be effective without delaying resource recovery. Visual inspections are preferred over chemical analysis of samples because of: difficulty of sampling areas with high variability; time and costs to complete sampling and analysis; and lack of guidelines on what levels are safe.
Visible Oil But No More than Background	This endpoint is often applied where there is a significant background rate of tar ball deposition on the shoreline.
No Longer Generates Sheens that Will Affect Sensitive Areas, Wildlife, or Human Health	This endpoint is used where sheening persists after cleanup efforts become ineffective, or on sensitive habitats where further cleanup efforts will cause more harm than natural removal. Residual sheening should persist over a relatively short time period. Sheen is an oil film ranging from barely visible to dull colors. Sorbents effectiveness is usually limited in recovery of sheens. Consider the amount and duration of sheening, and the distance to sensitive resources, to determine if sheening poses a significant threat. Consider the degree of exposure: high wave/tidal exposure speeds removal and breaks up sheens; sheltered areas will sheen longer and sheens will be more persistent. Consider the degree and timing of use: sheening may be tolerated in areas or during periods of low use; even minor sheens may not be tolerated in areas of high use, such as swimming beaches.
No Longer Rubs Off on Contact	This endpoint is usually defined as oil removal to a stain or coat, or weathering to the point that it is no longer sticky. It is applied to hard substrates (rocky shores, seawalls, riprap, gravel) and vegetation (marshes, mangroves). The objective is to prevent oiling of fur, feathers, and feet of wildlife, and oiling of people and property during contact with oiled surfaces. Consider the degree and timing of use: high-use areas often require higher cleanliness, whereas natural removal is allowed in low-use areas where further cleanup efforts will be disruptive.
Oil Removal to Allow Recovery/ recolonization Without Causing More Harm than Natural Removal of Oil Residues	This endpoint is used where further oil removal will result in excessive habitat disruption (e.g., trampling of soft sediments and plant roots, mixing oil deeper, extensive sediment removal, vegetation cutting) or high biota mortality (e.g., from high-pressure, hot-water washing of intertidal communities). It is also used for areas with difficult access, which limits the type of cleanup that can be conducted along that shoreline segment. Consider the potential for erosion from excessive sediment removal, particularly where erosion/deposition patterns of the beach cycle will re-work and clean sediments within an acceptable time frame.

Box 2:

Complying with Section 7 of the Endangered Species Act (ESA) During Oil Spill Response

- ESA provides protection for listed species and their designated critical habitats (50 CFR 402).
- Section 7 of the ESA prohibits "take" of individual animals or adverse modification or destruction of critical habitat.
- **Take** is defined as to harass, harm, pursue, hunt, shoot, wound, kill, trap, capture, or collect, or to attempt to engage in any such conduct.
- Federal agencies must ensure that their **actions** don't jeopardize the continued existence of listed species or destroy critical habitat.
- The FOSC (either USCG or USEPA), as the Lead Federal Agency, must determine whether or not listed species and/or critical habitats are present within the area of the operation.
- **Action** is defined as "…all activities or programs of any kind authorized, funded, or carried out, in whole or in part, by Federal agencies in the United States or upon the high seas."
- Federal agencies conduct interagency consultation, (aka Section 7 consultation), with the US Fish and Wildlife Service and National Marine Fisheries Service either formally or informally on any action that may affect listed species.
- The USFWS and/or NMFS generate Best Management Practices (BMPs) for response-related activities to minimize impacts to listed species and critical habitats. These become part of the shoreline treatment recommendations that are issued to the Operations Section.
- Depending on the spill conditions, these recommendations may require special agency field monitors during cleanup operations to **document compliance** with the BMPs
- Furthermore, there may be a need to document SCAT compliance with any BMPs that have been developed for SCAT teams to follow during their field surveys.
- The Inter-agency Memorandum of Agreement Regarding Oil Spill Planning and Response Activities Under the Federal Water Pollution Control Act's National Oil and Hazardous Substances Pollution Contingency Plan and the Endangered Species Act (dated 2001) is available at: http://www.uscg.mil/npfc/docs/PDFs/urg/App/ESA_MOA_AppA_04.pdf

Box 3:

Complying with Section 106 of the National Historic Preservation Act (NHPA) During Oil Spill Response

- Under Section 106 of 36 CFR 800, Federal agencies are required to take into account the effects of their undertakings on historic properties that are listed in, or eligible for, inclusion in the National Register of Historic Places (NRHP).
- The FOSC (either USCG or USEPA), as the Lead Federal Agency, must determine whether or not NRHP-eligible Historic Properties are present within the area of the operation.
- If Historic Properties are present, the Lead Federal Agency must then determine whether or not the undertaking will have an adverse effect on them.
- This determination is made by consulting with State Historic Preservation Offices (SHPOs), Native American tribes, Federal land managers, and other stakeholders on the presence of and potential adverse effects to Historic Properties prior to the start of cleanup operations.
- After consultations, the FOSC, the SHPO, and other stakeholders reach an agreement on how the adverse effects on Historic Properties will be addressed such as avoidance, monitoring, mitigation, or other procedure.
- A Historic Properties Specialist oversees the Section 106 process during the development of shoreline treatment recommendations and develops recommendations to be implemented by SCAT and Operations during their work. Examples include:
- No Known Cultural Concern – Work can proceed without archaeological monitoring. If cultural concerns are discovered, work must stop and Section 106 Team notified.
- Potential Cultural Concern – Project area requires archaeological survey before work can proceed.
- 250 Meter Sensitivity Zone – Project is within 250 meters of a known cultural resource. Archaeological monitoring required during the undertaking.
- There is a Programmatic Agreement under the National Contingency Plan whereby this process is expedited during oil spill emergencies.
- In some regions of high sensitivity, archaeologists and/or tribal representatives may accompany the SCAT teams to identify unknown historic sites, confirm current condition of known sites, and make sure that SCAT team activities do not disturb such sites.
- The Programmatic Agreement on Protection of Historical Properties During Emergency Response Under the National Oil and Hazardous Substances Pollution Contingency Plan is available at: http://www.achp.gov/NCP-PA.html.

The SCAT Coordinator can form a work group to evaluate cleanup options and make recommendations on other issues that arise. Besides reviewing published studies and case histories, they can consider on-site testing for effectiveness and environmental effects of the proposed method(s) under the spill-specific conditions. The selection of shoreline treatment methods involves choices (aka tradeoffs) between the degree of oil removal and degree of impact associated with the

method as shown in Figure 6. Method 3 was too aggressive; though it removed the most oil, it also had the longest recovery rate. Method 2 removed less oil but had moderate habitat recovery. Method 1 was the best option; it removed the most oil and had the best recovery.

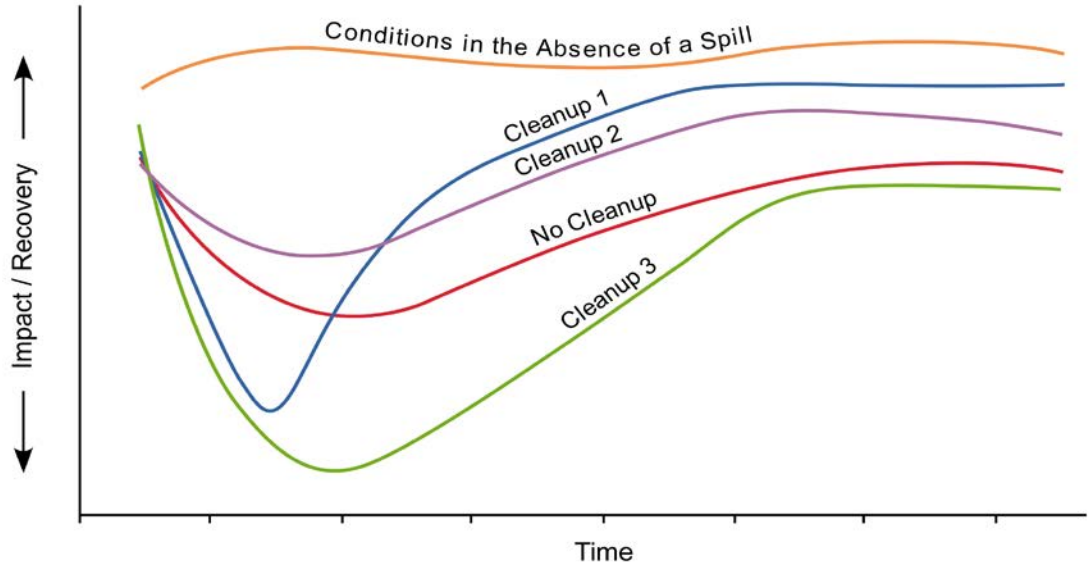


Figure 6. Impact and recovery of various cleanup methods, including natural recovery. Note that Cleanup method 3 removed the most oil but had the longest habitat recovery. Cleanup method 1 was the best option because it removed more oil and had the fastest habitat recovery.

Guidelines for cleanup endpoints that consider this tradeoff concept are outlined in Table 2. Although the highest cleanup endpoint is removal to the point of no observed oil, this is often not possible, particularly if there is a background rate of oil deposition (e.g., natural seeps, shipping traffic). In these cases, a more appropriate endpoint would be cleanup of visible oil, but not exceeding the background amount. Note that "visible" oil applies not only to oil on the surface, but also subsurface oil that must be exposed in trenches dug into the sediments. When shoreline cleanup to achieve these endpoints is likely to cause added harm to the environment, three additional endpoints may be considered:

- Oil removal to the point where the shoreline no longer generates sheens that affect sensitive areas, wildlife, or human health;
- Oil removal to the point where it no longer rubs off (e.g., no longer sticky or tacky or a threat to wildlife); and
- Oil removal to the point that allows recovery/recolonization without causing more harm than leaving the oil in place.

Why Cleanup Endpoints for Inland Spills are Often More Stringent

- Inland habitats often lack some of the physical processes (such as waves and tidal currents) that can speed the rate of natural removal of oil residues after treatment operations are terminated.
- The direct human uses of inland habitats, such as for drinking water, recreation, industrial use, and irrigation, require a higher degree of treatment compared to marine environments to avoid human health and socio-economic impacts.
- Spills in close proximity to where people live, work, or recreate often require treatment to a higher level.
- Inland spills can affect smaller waterbodies where there are slower rates of dilution and degradation.
- There may be large-scale differences in water levels during the response, causing oil to be stranded well above normal levels where it can pose hazards to wildlife as well as humans using these areas.
- Many states have sediment quality guidelines that must be met as part of the remediation phase after the emergency response is completed.

Cleanup Endpoints and Trade-off Issues by ESI Shoreline Type

Examples of cleanup endpoints and trade-off issues used at previous oil spills for different shoreline types are included below, to assist you in developing spill- and site-specific endpoints. Each spill will have a unique combination of oil type, rate of natural removal, biological sensitivity, timing windows (how quickly the cleanup has to be completed), and human use issues that may lead to different endpoints. Note that many of the endpoints incorporate SCAT terms.

Exposed Rocky Shores and Wave-Cut Platforms (ESI = 1A and 2)

<u>Cleanup Trade-off Issues</u>

- Shoreline access is often difficult, dangerous, and limited to low tides and calm wave conditions.
- Rapid natural removal rates are expected, so these shorelines usually have lower priority for cleanup. Thus, cleanup endpoints are seldom an issue because onshore cleanup activities are not initiated.
- High wave energy at these sites usually breaks up sheens, limiting the distance sheens can spread and thus the areal extent of threat to sensitive resources.
- Timing is often a critical component in allowing natural removal to proceed, particularly for the presence of migratory waterfowl, seabird nesting, and breeding activities of marine mammals.
- May consider limited removal of persistent residues that are affecting sensitive resources (e.g., sources of sheens very near active bird nesting colonies).

Example Cleanup Endpoints

- No accessible oiled debris.
- No surface oil greater than Stain or Coat on solid surfaces >20% distribution.
- In inaccessible areas where further oil removal is not possible because of safety restrictions, cleanup can be terminated when the shoreline no longer generates sheens that affect sensitive wildlife.
- On exposed rocky shores used as marine mammal haulouts, persistent oil should be removed until the oil is no longer sticky, unless cleanup is too disruptive to animals at the site.

Solid Man-Made Structures (ESI = 1B and 8B) (e.g., seawalls, pier pilings, bulkheads)

Cleanup Trade-off Issues

- These shoreline types often occur in developed areas with chronic sources of pollutants or habitat degradation, so they usually have low biological sensitivity.
- More intrusive techniques are considered because of their lower biological use and need to minimize human exposure in areas of high public use.
- The lower part of the structure can have rich attached biota that should be protected during manual scraping or high-temperature, high-pressure flushing.

Example Cleanup Endpoints

- No accessible oiled debris.
- In industrial areas, no longer generates oil greater than sheens. In public access areas, no longer generates sheens.
- No surface oil greater than 20% Coat or Stain. In areas of high public use or visibility, no surface oil greater than 10% Coat or Stain.

Sand Beaches (ESI = 3 and 4)

Cleanup Trade-off Issues

- Amenity beaches often require a quick cleanup and high degree of cleanliness.
- The sand beach cycle is usually short, so re-worked and re-located sediments often can be rapidly returned to their normal profile on exposed beaches. Wave action can be an effective final "polishing" process, removing residual stains.
- Oil on the surface of sand beaches is relatively easy to clean; however, difficulties arise when the oil is buried because of the amount of sediment that must be removed.
- Where sand can be replaced by existing nourishment projects, more sediment removal is generally allowed to quickly remove oil from public beaches.

Example Cleanup Endpoints

- No visible oil on the surface.
- No oiled wrack. Wrack that is not oiled should not be removed from the beach.

- All tar balls or tar patties that could be removed by reasonable cleanup techniques should be removed. Remaining tar balls and tar patties should be at or below normal background frequency. Increases in tar ball frequency above background will require further cleanup.
- No subsurface oil layers in pits dug into the beach. Buried tar balls should be at or below background frequency.
- On beaches with high resource value, such as those in Wildlife Refuges, less stringent endpoints can be used to minimize impacts to the habitat that would affect beach use by shorebirds or sea turtles.

Mixed Sand and Gravel Beaches (ESI = 5) and Gravel Beaches (ESI = 6A)

Cleanup Trade-off Issues

- Beaches with a significant amount of gravel are relatively difficult to clean because they have high potential for deep penetration and burial. Deeply penetrated oil can be a chronic source of remobilized oil for months or longer.
- Natural replenishment rates of gravel are slow, so sediment removal is usually minimized and sediment reworking or natural removal considered after gross oil removal is completed.
- The most difficult issue is removal of persistent, deeply penetrated oil because of the degree of physical disruption to both the beach profile and sediment distribution patterns. It is difficult to predict how long natural removal at a specific site will take.
- Gravel is mobilized mostly during storms, so it could take months to years for a coarse gravel beach to return to normal after extensive physical disruption.

Example Cleanup Endpoints

- No surface oil more than 10% Coat or Stain on the gravel-sized sediments.
- No subsurface oil greater than 20% Coat or Stain. Occurrences of buried tar balls should be at or below background frequency.
- In remote, difficult access areas, no more than 20% Coat or Stain on the gravel-sized sediments, and subsurface oil no more than 5% Oil Residue.

Riprap Structures (ESI = 6B)

Cleanup Trade-off Issues

- Riprap often occurs in developed areas with chronic sources of pollutants or habitat degradation nearby.
- More intrusive techniques are considered because of their lower biological use and need to minimize human exposure in high public use and populated areas.
- It is extremely difficult to completely remove oil from crevices and undersides of the riprap because they are inaccessible. It sometimes requires replacing the oiled pieces of riprap, which can be highly intrusive and expensive.
- With higher residues remaining, they can release sheens for weeks or longer.

Example Cleanup Endpoints

- No accessible oiled debris.
- In industrial areas, no longer generates sheens. Sorbents will be deployed to recover sheens.
- No surface oil greater than 20% Coat or Stain. In areas of high public use or visibility, no surface oil greater than 10% Coat or Stain.
- In areas of high public access, no oil on the surface that rubs off on contact.

Exposed and Sheltered Tidal Flats (ESI = 7 and 9)

Cleanup Trade-off Issues

- The risks of physical disruption and mixing of the oil are very high, thus passive cleanup (e.g., deploying sorbents) is often the only activity. Even then, extreme care is needed.
- Since there is usually another shoreline type at the upper intertidal zone, care is needed to prevent impacts to the lower tidal flat during cleanup activities along the shoreline.

Example Cleanup Endpoints

- No longer generates sheens that will affect sensitive areas, wildlife, or human health.
- No oiled wrack. Wrack that is not oiled should not be removed from the flat.
- Oil removal can be terminated when further cleanup efforts will result in excessive habitat disruption that will cause more harm than natural removal of oil residues.

Marshes (ESI = 10A and 10 B)

Cleanup Trade-off Issues

- Natural removal rates are very slow. Thick oil on vegetation is usually removed only when the vegetation dies back and sloughs off.
- Generally efforts focus on recovery of free oil trapped in the marsh and deployment of sorbents to recover sheens. Most types of active cleanup in the marsh can cause significant habitat impact and slow overall recovery.
- Foot traffic on the vegetation should be minimized; use boardwalks, work from boats, or restrict work to the marsh edge.
- Oil on marsh vegetation generally weathers to a dry coat within weeks, after which it is a lower threat of oiling wildlife using the marsh.

Example Cleanup Endpoints

- No oil on vegetation that can rub off on contact.
- No longer generates sheens that will affect sensitive areas, wildlife, or human health.
- No free-floating oil in the marsh.
- No longer generates sheens that will affect sensitive areas, wildlife, or human health.
- As low as reasonably practicable, considering the allowed treatment methods and net environmental benefit

Mangroves (ESI = 10D)

Cleanup Trade-off Issues

- Natural removal rates are very slow. Thick oil on vegetation is usually removed only when the vegetation dies back and sloughs off.
- Generally efforts focus on recovery of free oil trapped in the mangrove fringe and deployment of sorbents to pick up sheens. Most types of active cleanup in the mangrove can cause significant habitat impact and slow recovery.
- Foot traffic into the mangrove forest should be minimized; use boardwalks, work from boats, or restrict work to the mangrove fringe.
- Oil on the prop roots and leaves generally weathers to a dry coat within weeks, after which it is a lower threat of oiling wildlife using the mangrove.

Example Cleanup Endpoints

- No oil on prop roots and leaves that can rub off on contact.
- No longer generates sheens that will affect sensitive areas, wildlife, or human health.
- No accessible free-floating oil in the mangrove forest.
- No accessible oiled wrack. Wrack that is not oiled should not be removed.

Large Debris (e.g., Logs, Abandoned Vessels) Excluding Historic/Cultural Items

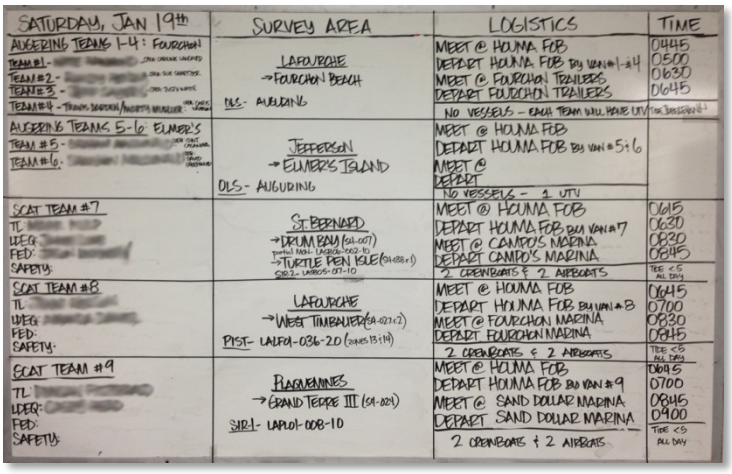
Cleanup Trade-off Issues

- Large pieces of debris are difficult to remove and generate large volumes of waste for transport and disposal.
- Oil on the debris generally weathers to a dry coat within weeks, after which it is a lower threat of oiling wildlife.
- Only the more heavily oiled parts of the debris should be removed (if they can be separated), leaving behind less oiled parts.

Example Cleanup Endpoints

- No surface oil greater than Stain or Coat > 20% distribution.
- No oil on surfaces that can rub off on contact.
- Do not conduct wholesale removal of unoiled natural debris.

5.4 Pre-survey Planning and Daily Team Assignments



Objective

- Based on reconnaissance survey information, determine areas to be surveyed, field logistics, and team assignments.

Responsibility

- SCAT Coordinator, Team Leaders

Methods

- Revise the standard shoreline oiling codes and forms, if needed, to fit spill conditions.
- Form teams with appropriate membership (expertise and affiliation)
- Assign team leaders. Generally they are most experienced person in SCAT. See Chapter 4 for responsibilities and qualifications.
- Ensure that all Team Members have the required safety training.
- Each Team Member must read and sign the Incident Site Safety Plan and the SCAT Field Safety Plan and discuss specific safety concerns related to SCAT activities. The SCAT Field Safety Plan must include a communications plan with set times or events when each team checks in by phone or radio. Appendix F includes the SCAT Field Safety Plan for the MC 252 response as an example.
- Determine logistical requirements for the teams and coordinate requests to the Logistics Section.
- Assign survey areas (primary and backup) for each team, based on priorities, logistics, local expertise, and land management or ownership.
- Generate base maps showing the segment boundaries and names.
- Distribute Operations Division and/or segment maps for primary and backup areas; distribute SOS forms and codes, base maps, and sketch sheets (see Chapter 6 for forms and codes).
- Distribute field equipment (see checklist in Appendix A).
- Brief team on survey objectives, logistics (e.g., transportations, communications, food), and safety issues.
- Discuss cleanup endpoints, guidelines for recommending treatment, and criteria for priorities.
- Discuss reporting requirements and schedules.
- Calibrate on the first field day by having all Team Members visit a segment together and agree on how the oiling descriptions will be applied. This step is essential.
- Schedule a debrief at the end of the day for all SCAT teams to report findings and safety issues, and to plan assignments for the following day.

5.5 Shoreline Surveys

Objectives

- Collect data on shoreline types, oiling conditions, and ecological and human-use resources for each segment.
- Reach agreement on treatment recommendations and priorities for specific segments.
- Confirm that recommendations are effective and beneficial to the environment (refer to list of questions in Chapter 3).

Responsibility

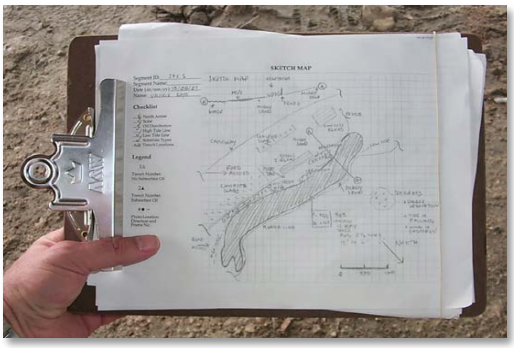
- SCAT Team

Methods

- Comply with the Incident Site Safety Plan and the SCAT Field Safety Plan at all times.
- Confirm segment boundaries upon arrival at the assigned segment, or if not yet determined, delineate segment boundaries during the SCAT survey.
- Conduct survey to identify shoreline types (refer to Table 1) and extent of oiling. The team should spread out so that the entire intertidal and supratidal zones are covered.
- Describe the shoreline characteristics, surface oil conditions, subsurface oil conditions, and special considerations (ecological, recreational, cultural) using standard terms and codes on the Shoreline Oiling Survey (SOS) form. Section 6 provides more details about the forms, terms, and codes. See Appendix I for a step-by-step guidance on completing the SOS form.
- It is important to always dig pits in permeable substrates. Look at the shoreline for clues as to where oil may have become buried by the deposition of clean sediment. Also dig pits to determine the thickness of oil penetration below the surface.
- Sketch the segment, if appropriate, focusing on the oil distribution and special considerations. See Appendix E for a primer on drawing field sketches.
- Delineate the start/end of each oil zone within the segment, by waypoints AND marks on the segment map. Zones can be along shore or cross shore, where the oiling degree and/or shoreline type changes, such as along a sand beach with surface residue that changes to a riprap wall with coat along shore or dunes in the supratidal zone that contains a small number of tarballs.
- Note presence of submerged oil in nearshore zone for spills of heavy oil.
- Log and locate all photographs taken. Use a photo scale (an example is included in Appendix D) for close-up photographs (see photography guidance in Appendix G).
- Collect oil and/or sediment samples based on identified needs. However, sampling should not detract from SCAT's primary mission.
- Discuss and agree on the need for treatment recommendations and priorities.
- Complete the surveys each day in time to meet reporting deadlines.

NOTE: *SCAT teams cannot direct cleanup contractors in the field, though teams can document unapproved cleanup methods or improper techniques. The SCAT Coordinator will communicate with the Planning or Operations Section Chief to rectify the problem.*

5.6 Submitting Field Data



Objective

- Provide data needed to support shoreline treatment decisions and operations.

Responsibility

- SCAT Team, SCAT Coordinator, SCAT Data Managers

Methods

- Check all field maps and forms for accuracy, completeness, and legibility.
- Download digital photographs and GPS tracklines to generate survey maps, if appropriate (SCAT data managers can assist if on scene). See Appendices G and H for more details on these downloads.
- Generate a SCAT data package for each day's surveys that includes the completed forms, sketches, and maps showing the areas surveyed, and representative photographs of the habitats and oiling conditions. Be sure to write notes for each photograph noting its location and explaining what each represents.
- The SCAT Coordinator and/or data manager will review the package and identify missing or incomplete data.
- Copy all forms, sketches, and field notes for the field team as needed; keep originals on file.
- Summarize treatment recommendations by segment.
- Debrief the SCAT Coordinator on special issues, problems, and recommendations.
- Team Leads should call in or send electronically by email or text the results for urgent needs or when the teams are working remotely and unable to return to the Command Post each day.
- Attend end of day SCAT debrief meeting and get next day's assignment.
- Create summary tables and maps identifying segments to be treated, degree-of-oiling categories, or other products as needed (see Chapter 7 for more information on SCAT data management support and products).
- Early in the response, SCAT data must be generated in a timely manner so treatment recommendations get assigned to the Operations Section quickly.

5.7 Cleanup Evaluation/Effectiveness Monitoring

Objectives

- Monitor cleanup operations routinely to evaluate progress of cleanup activities and assess the need for modifying cleanup methods or endpoints.
- Investigate reports of new oiling, changes in erosional/depositional processes that are affecting oil behavior and the response, or other issues.
- Conduct tests to evaluate new treatment methods.

Responsibility

- SCAT Coordinator, Government representatives, major landowners, and SCAT Teams

Methods

- Visit segments where cleanup activities are being conducted to ensure that approved methods are being properly implemented.
- Respond to requests for changes in approved cleanup methods to address specific problems or changes in oiling conditions that render the approved methods ineffective.
- Organize and conduct field-testing and monitoring programs, if needed, during evaluation or use of innovative treatment methods.
- Establish and monitor beach profile transects to document beach erosion and deposition on beaches, which can be very important if there is a risk for deep burial of oil during a depositional period.
- Modify cleanup endpoints, as needed, due to changes in oiling conditions, safety issues or seasonal changes (e.g., winter freeze-up or start of bird-nesting on a segment).
- Produce summary reports and documentation on special issues, problems, and changes in recommendations related to shoreline treatment methods and endpoints.

5.8 Post-Cleanup Inspections

Objective

- Inspect segments that the Operations Section declares ready to determine if they meet endpoints or require further treatment.

Responsibility

- SCAT Team, Land Manager, Land Owner, and Local government representatives (sometimes called a Sign-off Team or a Cleanup Assessment Review Team). Agencies must delegate sign-off authority to their representatives on the team.

Methods

- SCAT Coordinator receives notification from the Operations Section that a segment is ready for inspection.
- Determine additional representatives that need to participate in the inspection, such as the land manager, landowner, or local government representatives. For large spills, it may be appropriate to conduct a pre-inspection with just SCAT to make sure that the segment is ready before involving these others.
- Inspect the segment against the cleanup endpoints (preferably using the same team that did the original survey). The original field sketch/map/ photographs can be very helpful for evaluating effectiveness of the treatment.
- There are three possible outcomes of the inspection (see Figure 3): No Oil Observed, No Further Treatment, or Further Treatment Recommended.
- Determine if further treatment is required using standard shoreline assessment terms, forms, and sketches, or develop special forms for this purpose. If further treatment is recommended, the segment goes back to Operations, with identification of specific areas to be treated.
- Depending on the spill-specific response plan, SCAT can recommend that the segment be moved out of the "active" cleanup phase, to the next phase, such as patrol and monitoring or passive treatment (usually deployment and maintenance of sorbents to recover sheens).
- If the segment meets endpoints or if no further treatment is recommended because of net environmental benefit, the segment can be submitted for final approval by the Unified Command to be moved out of the response.
- Submit the result of the inspection by SCAT to the Planning Section using the required forms, other documentation, and signatures.
- For some responses, a Shoreline Inspection Report (SIR) is used to document agreement among the Team Members of the results of the inspection, with all Team Members signing the form. See Appendix D for two example SIR forms used at past spills. Because this last step can range from simple to complex, there is no one form that would apply to all responses.

5.9 Final Sign-Off of Cleanup Activities

Objective

- Approve the termination of all cleanup activities at each segment.

Responsibility

- Unified Command.

Methods

- Following post-cleanup segment inspections that meet cleanup endpoint criteria, the SCAT Coordinator reviews the results of the SCAT team inspection to make sure that endpoints have been met and the documentation is complete.
- This documentation is turned into the Planning Section who reviews/approves it and forwards the package to the Unified Command for their final review and approval. Note that, for some spills, there may be a need for Section 106 review of and sign off on the package before it goes to the Unified Command.
- The Unified Command or their representatives sign the segment out of the response or to the next phase of the response.

6 Shoreline Survey Terms, Codes, and Forms

Using standard terms and forms to describe and report shoreline-oiling conditions are the basic building blocks of shoreline assessment. Ambiguous words, such as "heavy" oiling, do not provide the necessary detail to document the oiling condition or the need for and type of cleanup to be conducted. The terminology and codes used by SCAT teams for most oil spills are defined in Figures 7-11. SCAT teams need to be trained and calibrated so they can consistently apply these terms to spill-specific conditions. The terminology and codes for spills of light refined products are somewhat different and defined in Table 3. To aid teams in uniformly estimating percent cover, two different types of percent cover estimator charts are included in Appendix D. The *Shoreline Assessment Job-Aid* is a valuable field tool to help teams use proper terminology and protocols in the field.

All Team Members must agree on how they will use these terms and codes for a specific spill. Thus, a calibration field exercise, conducted jointly by all Team Members during the first survey, is always necessary. For responses that extend over months and during rotation of Team Members, re-calibration will be needed.

Various forms have been developed to record the observations of shoreline assessment teams, depending on the oiling conditions, environments, and shoreline types. All of the forms use the standard codes and terms in Figures 7-11. Operations staff will also need training and guidance on how to interpret SCAT data, although they usually see summary reports. Appendix D contains copies of all forms and explanation of terms and codes.

Shoreline Oiling Survey (SOS) form: used for most coastal shoreline oiling conditions. An example for an example segment and accompanying SCAT map is shown in Figures 12 and 13. Section 6 of the form allows recording of surface oiling conditions for tar balls (as # per unit area) when the oiling distribution is less than 1%. Subsurface oiling conditions are documented by digging pits and recording the pit information in Section 7. This form is the most complex and requires a high level of training to complete it properly.

Wetlands SOS form: includes fields to record the oiling characteristics on the marsh soils as well as the height, thickness, and % distribution of oiling of the vegetation.

Tar Ball SOS form: used to record more detailed information for spills with widely scattered tar ball oiling. Figure 14 is a Tar Ball SOS form completed for Zones A-D shown in Figure 11.

River and Stream SOS forms: used on inland spills, notably the 2010 Enbridge spill in the Kalamazoo River in Michigan and the 2011 Silvertip spill in the Yellowstone River in Montana.

Field Observer form: for use for Type 4-5 responses, or during larger responses to quickly get field information back to Operations early in the response.

All forms have fields for entering oiling conditions for the different "zones" within a segment. Each zone represents a unique combination of shoreline/habitat type, oiling conditions, and tidal zone/river bank/stream bank. Zones can be along shore, such as where the shoreline type changes from sand beach to riprap; or cross shore, such as oil in a marsh in the upper intertidal zone as well as on a tidal flat in the middle intertidal zone. Treatment methods and endpoints may vary with each zone.

R Bedrock outcrops
B Boulder (>256 mm in diameter)
C Cobble (64-256 mm)
P Pebble (4-64 mm)
G Granule (2- mm)
S Sand (0.06-2 mm)
M Mud (silt and clay, <0.06 mm)
RR Riprap (man-made permeable rubble)

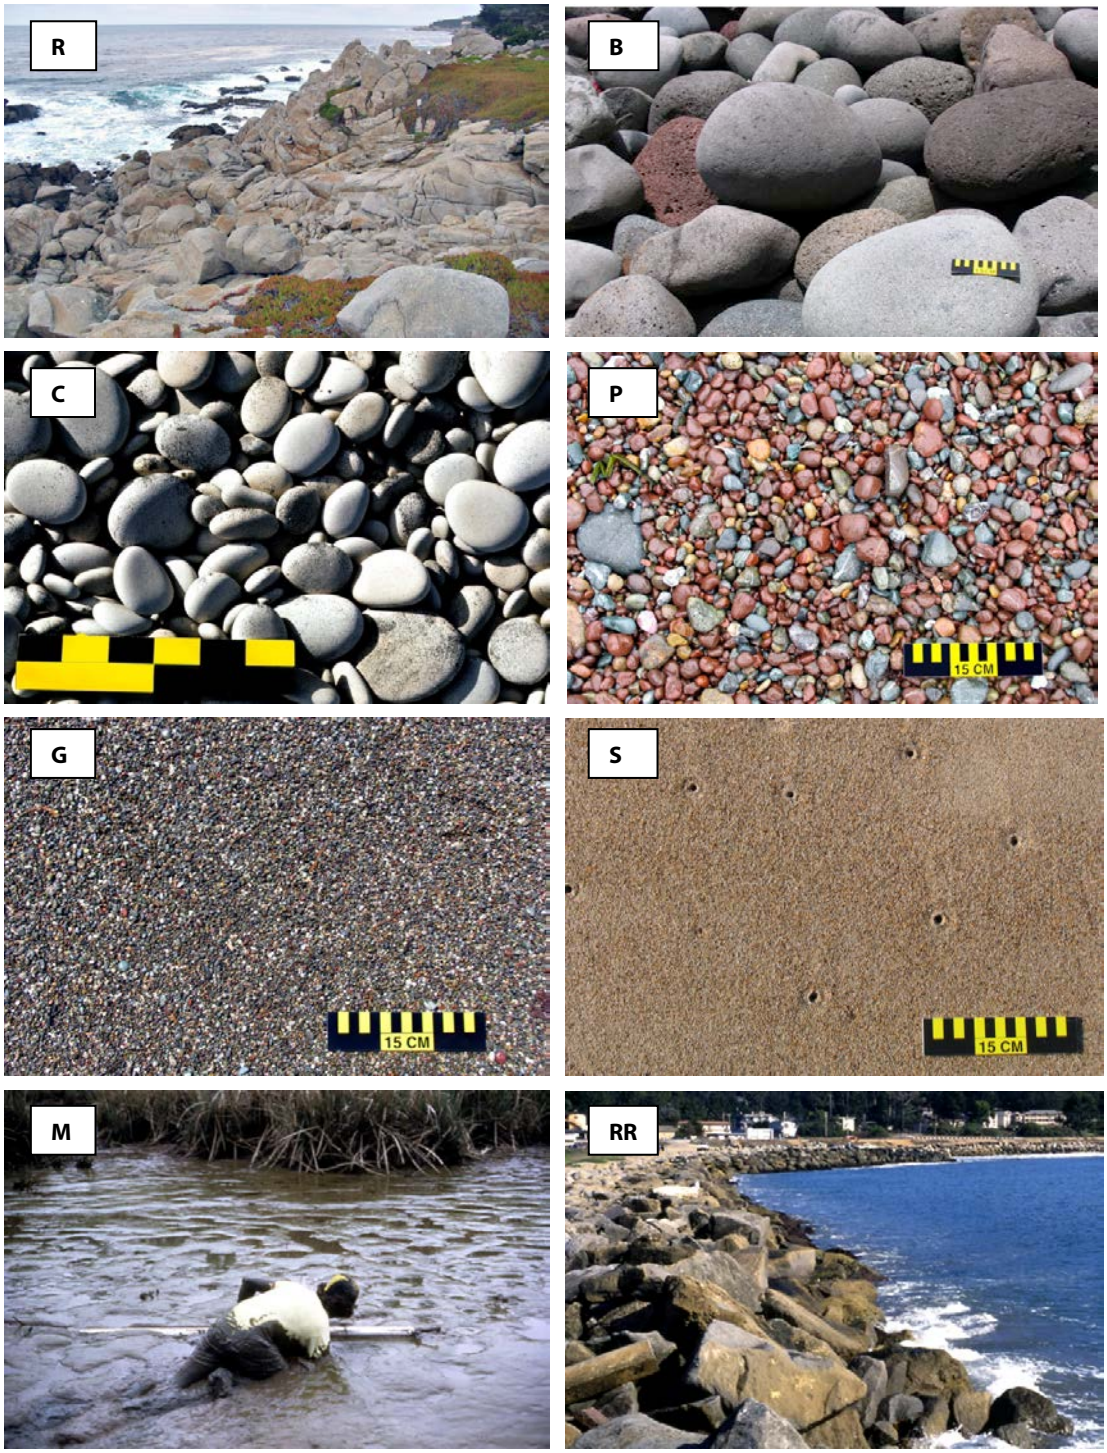


Figure 7. Sediment Types.

C	Continuous 91 - 100%
B	Broken 51 - 90%
P	Patchy 11 - 50%
S	Sporadic 1 - 10%
T	Trace <1%

Figure 8. Oil Distribution.

TO	Thick Oil (fresh oil or mousse >1 cm thick)
CV	Cover (oil or mousse from >0.1 cm to <1 cm on any surface)
CT	Coat (visible oil <0.1 cm, which can be scraped off with fingernail)
ST	Stain (visible oil, which cannot be scraped off with fingernail)
FL	Film (transparent or iridescent sheen, or oily film)

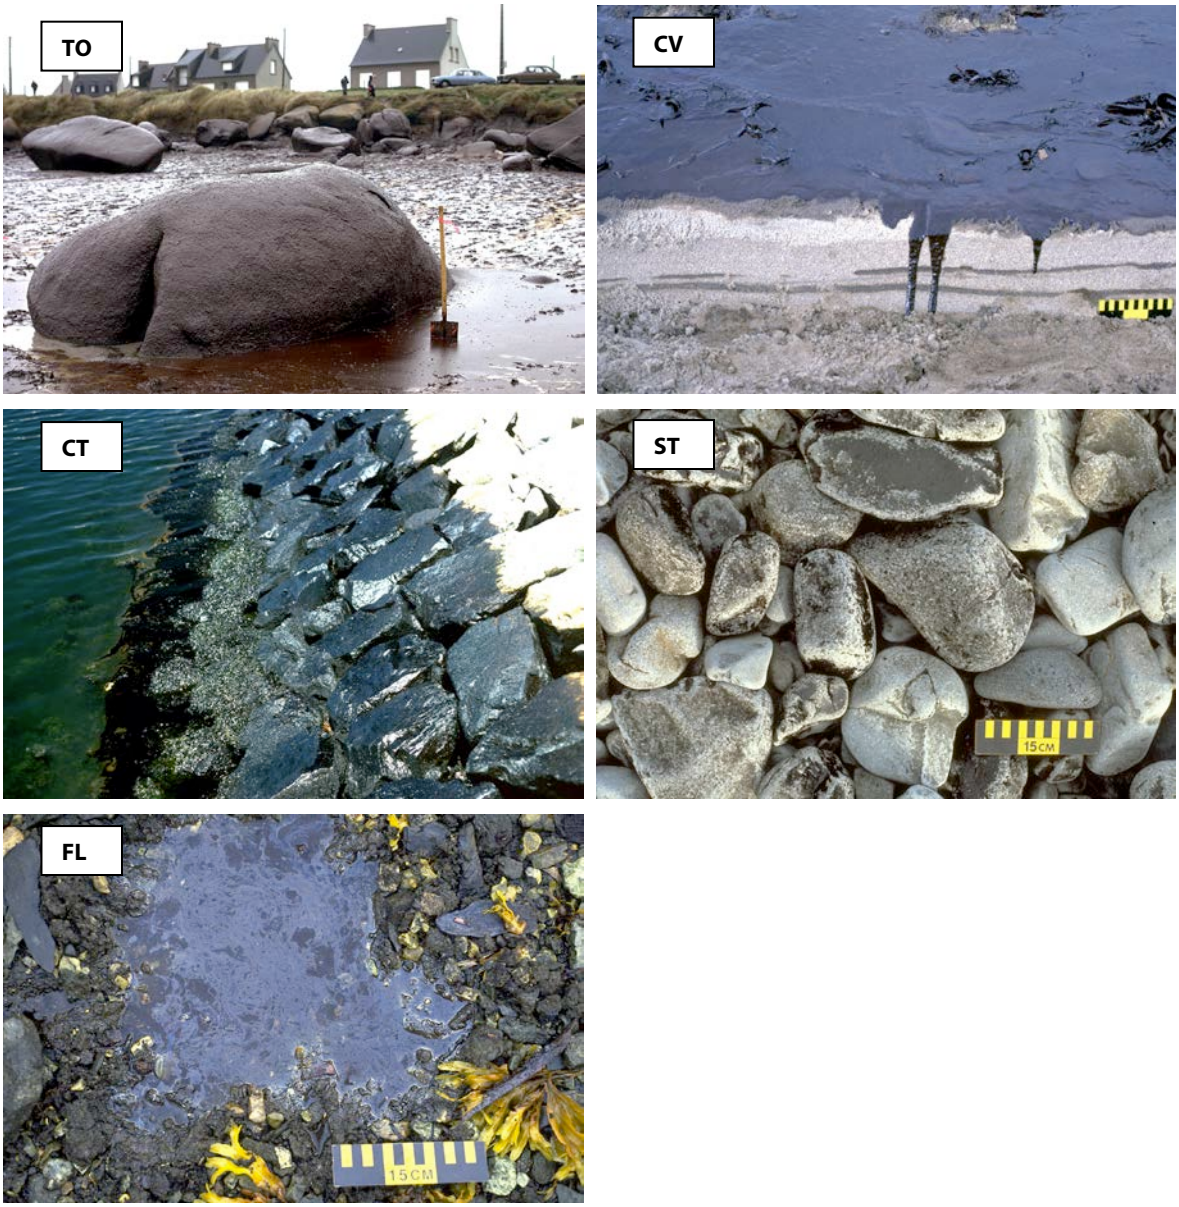

Figure 9. Surface and Subsurface Oiling Descriptors – Thickness.

FR	Fresh Oil (unweathered, liquid oil)
MS	Mousse (emulsified oil occurring over broad areas)
TB	Tar Balls (discrete accumulations of oil <10 cm in diameter)
PT	Patties (discrete accumulations of oil >10 cm in diameter)
TC	Tar (highly weathered oil, of tarry, nearly solid consistency)
SR	Surface Oil Residue (non-cohesive, heavily oiled surface sediments, characterized as soft, incipient asphalt pavements)
AP	Asphalt Pavement (cohesive, heavily oiled surface sediments)

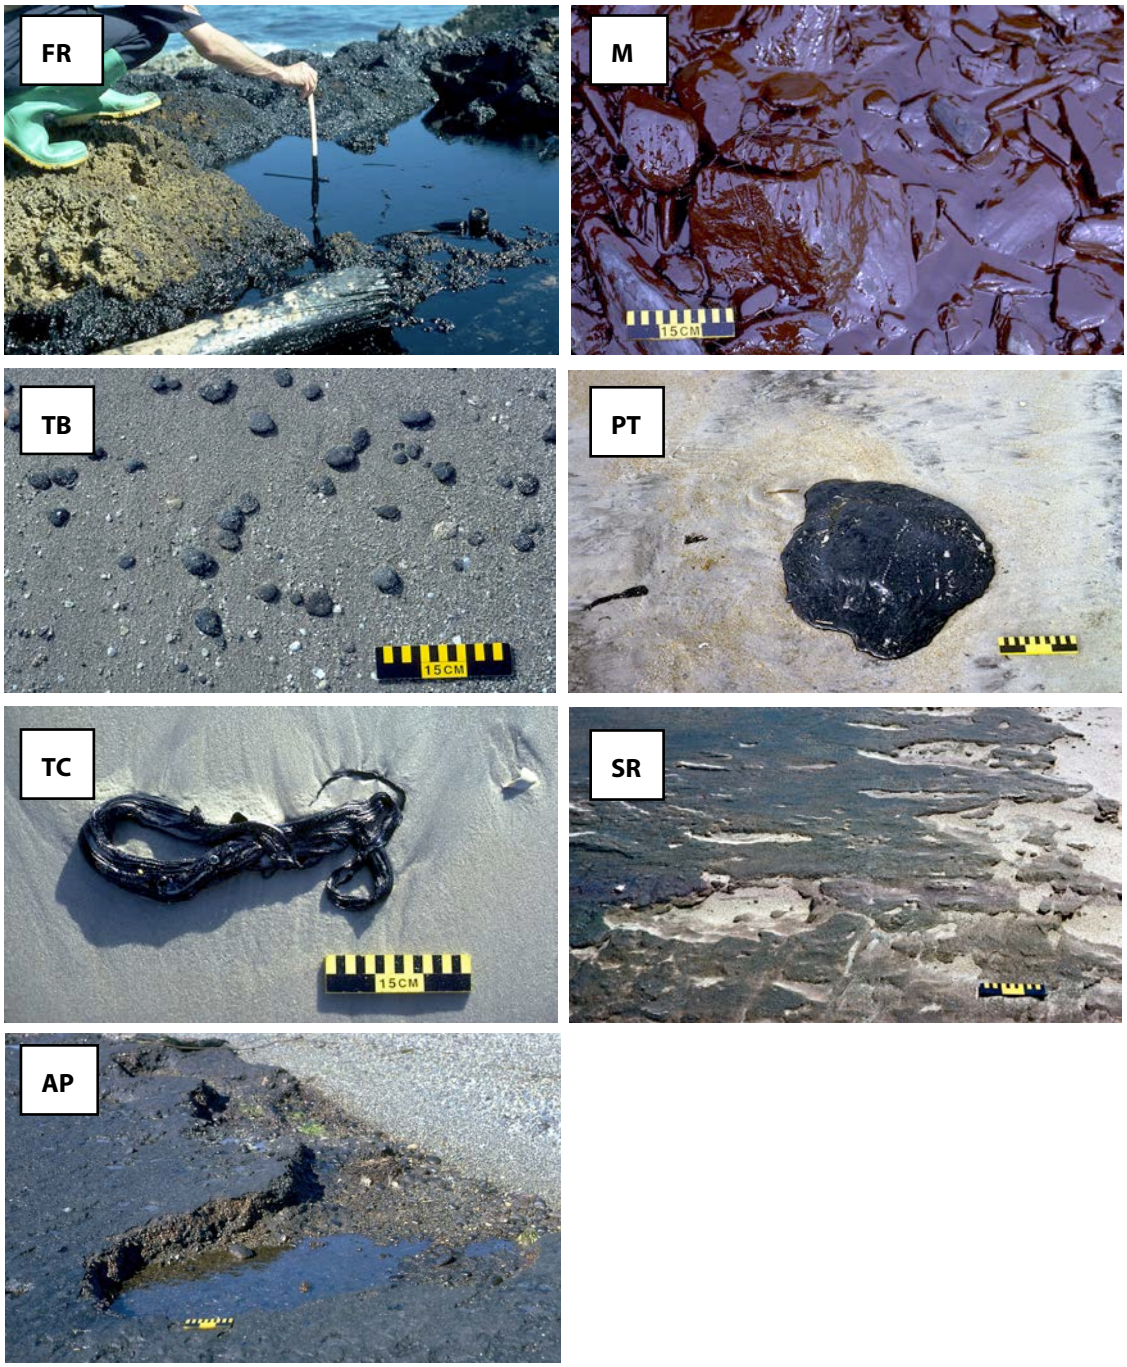

Figure 10. Surface Oiling Descriptors – Type.

OP	Oil-Filled Pores (pore spaces are completely filled with oil to the extent that the oil flows out of the sediments when disturbed). May also consist of weathered oil, such as a buried lens of asphalt pavement
PP	Partially Filled Pores (pore spaces partially filled with oil, but the oil does not flow out of the sediments when disturbed)
OR	Oil Residue (sediments are visibly oiled with black/brown coat or cover on the clasts (individual sediment particles), but little or no accumulation of oil within the pore spaces). Modifiers can be used, such as heavy oil reside (HOR); moderate oil residue (MOR); and light oil residue (LOR)
OF	Oil Film (sediments are lightly oiled with an oil film, or stain, on the clasts)
TR	Trace (discontinuous film or spots of oil, an odor, or tackiness)

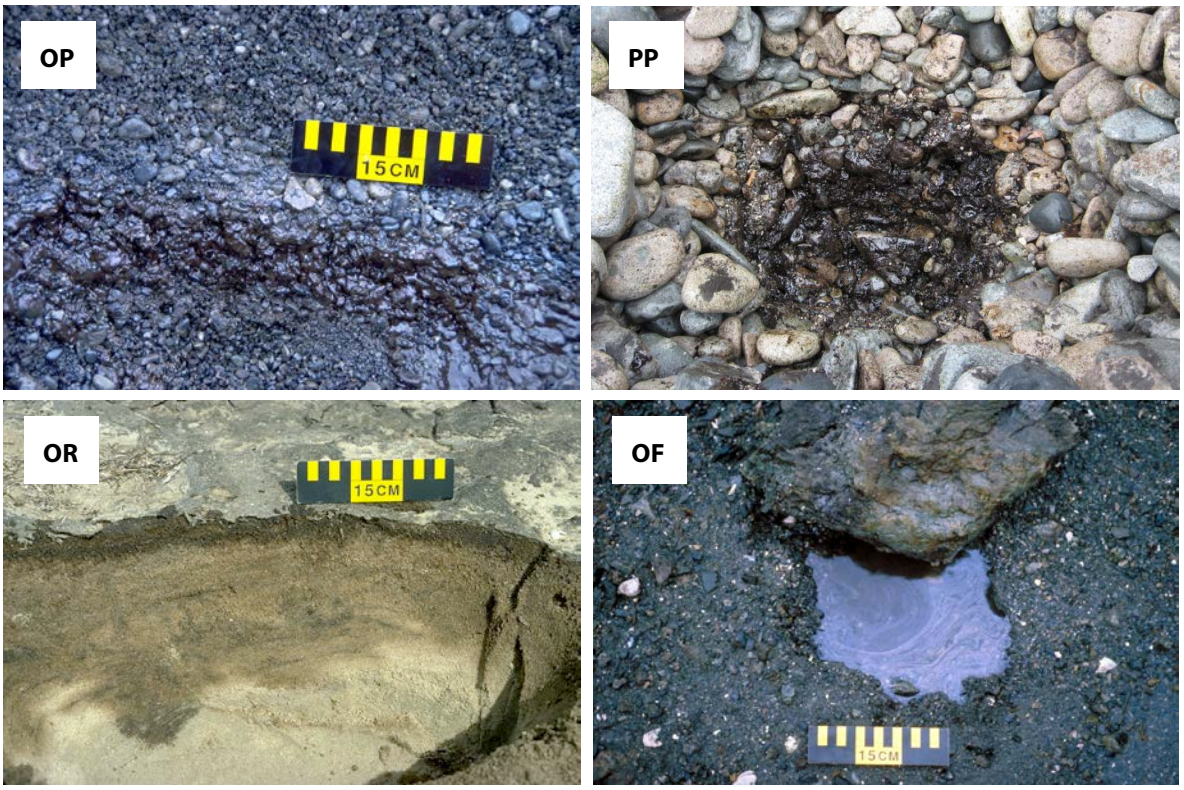

Figure 11. Subsurface Oiling Descriptors.

Table 3. SCAT terms to be used for spills of light, refined products.

<u>Surface and Subsurface Oiling Descriptors – Thickness</u>		
SM	Smell	No visible oil; detectable only by smell
FL	Film	Feels greasy when sediments are rubbed
SH	Sheen	Visible sheen on water surfaces
CT	Coat	Visible coating of oil
PO	Pooled	Liquid oil accumulated on surface
<u>Surface Oiling Descriptors – Color</u>		
None		Brown
Shiny		Yellow
Rainbow		Red

COMBINED SHORELINE OIL SUMMARY (CSOS) FORM: Example **Spill** **Page** 1 **of** 2

1. GENERAL INFORMATION	Date (dd/Month/yyyy) (please use month name)	Time (24h standard/daylight) (00:00 to 00:00)	Tide Height
Segment ID: LALF01-044-30	23/September/2012	09:40 to 11:20	L / (M) / H

Calculating Degree of Oiling

SCAT data are used to generate statistics on the number of shoreline miles by degree-of-oiling categories to the Unified Command. Two matrices that can be used to generate summary oiling descriptors, in terms of what is defined as "heavy," "medium," "light," and "very light" for a specific spill are provided in Figure 15. These oiling categories are defined based on the width of oiling bands on the shoreline (as measured perpendicular to the shoreline), the percent cover of oil within the band, and oil thickness using a two-step process:

- The width of the oil on the shoreline and the percent cover determine an initial oiling degree category using the top matrix;
- The thickness of the oil determines the final oiling degree using the bottom matrix. For example, a shoreline with a >3 m band of oil with 100% coverage is initially classified as Heavy surface cover. However, if the oil thickness is only a stain or film, the final surface oil category is Light; if the oil thickness is >0.1 cm, the final category is defined as Heavy.

The SCAT Data Managers use these matrices to generate statistics and maps. However, SCAT teams should not use these terms during their field surveys. **Terms such as heavy, moderate, light, and very light are only for final summaries and maps.** The matrices in Figure 15 should be modified by consensus for the spill-specific conditions, particularly the width of the oiled band that are defined as Wide, Medium, Narrow, and Very Narrow.

Step 1		Width of Oiled Area			
		Wide >6 m	Medium >3 m to 6 m	Narrow >0.5 m to 3 m	Very Narrow <0.5 m
Oil Distribution	Continuous 91 – 100%	Heavy	Heavy	Moderate	Light
	Broken 51 – 90%	Heavy	Heavy	Moderate	Light
	Patchy 11 – 50%	Moderate	Moderate	Light	Very Light
	Sporadic 1 – 10%	Light	Light	Very Light	Very Light
	Trace < 1%	Very Light	Very Light	Very Light	Very Light

Step 2		Initial Categorization of Surface Oil			
		Heavy	Moderate	Light	Very Light
Average Thickness	Pooled Oil > 1 cm	Heavy	Heavy	Moderate	Light
	Cover 0.1 – 1.0 cm	Heavy	Heavy	Moderate	Light
	Coat 0.01 – 0.1 cm	Moderate	Moderate	Light	Very Light
	Stain/Film < 0.01 cm	Light	Light	Very Light	Very Light

Figure 15. Matrices to be used in the two-step process to assign an oiling category for a segment. In the first step, the surface oiling degree is based on the width and the surface distribution. In the second step, the oiling category from the first matrix is combined with oil thickness in the second matrix to define the final oiling category. From Owens and Sergy (2000). Modify for the spill-specific conditions, particularly the width of Wide, Medium, Narrow, and Very Narrow.

Subsurface Oil…Always a Problem

Subsurface oil is a site-specific problem that must be delineated by labor-intensive digging to determine the areal extent of the subsurface layers. SCAT teams dig a pit using a pointed-edge shovel to at least 50 cm or to the water table. It is difficult to determine the presence or location of oiled sediments when the pit fills with water, and pits in sand tend to slump in when the water table is reached. The team looks for areas that appear depositional, such as at the high-tide berm, the horn of cusps, or updrift of groins or rocky outcrops. It is important to keep track of the changing tide levels between spring and neap tides. Oil may be buried in the high spring tide berm, which could be in the supratidal zone during neap tides.

When digging a pit, the spoils should be placed on the side of the pit that is towards the sun, so that when taking photographs, the sun is behind you, the sediment surface behind the pit is visible, and the light can shine on the side of the pit. The presence of subsurface oil is noted on the shoreline

survey form and delineated on a map. However, cleanup crews may not be able to locate the subsurface oil by reading the forms and maps. One common approach is to provide the survey team with surveyor's flags to mark the location of subsurface oil to be removed.

In fine-grained sediments (mud to small pebbles), if the oil has penetrated from the surface to no more than 5 cm, it is called surface oil (Figure 16A). Any oil that is deeper than 5 cm is called subsurface oil. In coarse-grained sediments (large pebbles to boulders), the subsurface begins at the bottom of the first layer of sediment (Figure 16B). We follow this approach because the first layer of coarse sediment can often be much greater than 5 cm.

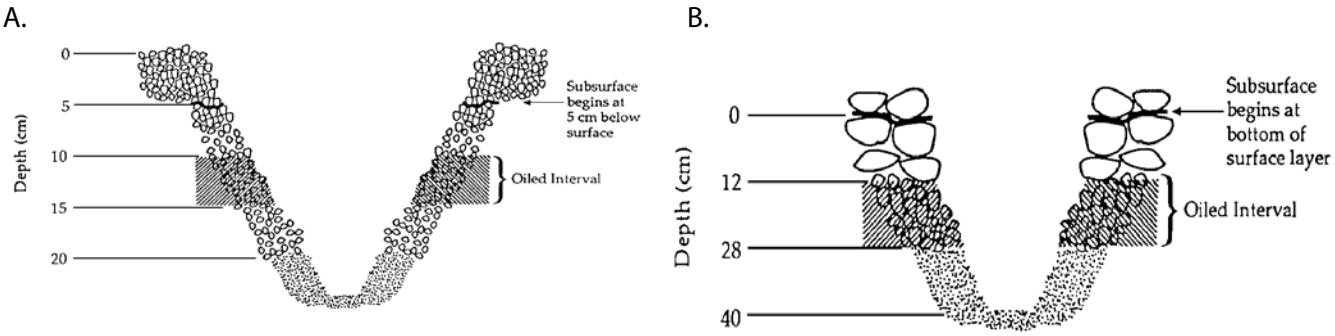

Figure 16. Definition of subsurface oil in fine-grained (A) and coarse-grained (B) sediments. From Owens and Sergy (2000).

Subsurface oiling is recorded in Section 7 of the SOS form using the descriptors and codes in Figure 11 (see completed examples in Figure 12).

Field Sketches are Important!

Sketches are a very important component of the field survey data. Sketches are better than photographs at characterizing overall conditions. Sketches help reviewers put the tabular data on oiled area and type into perspective, which assists decision-making. They document conditions better than photographs, videotapes, or statistics, and they allow better temporal comparisons. The sketches are particularly useful for spills when SCAT teams change over time. They can be used during post-cleanup inspections of segments to identify the locations of oil that were to be removed, and become the blueprint against which the effectiveness of the cleanup can be compared. Appendix E is a primer on drawing field sketches. A blank field sketch form is provided in Appendix D.

The objective of the shoreline surveys should always be remembered: to collect the information needed by decision-makers to formulate and approve shoreline cleanup plans. From these surveys, cleanup officials should be able to use the data to develop a detailed cleanup plan, including equipment and manpower needs. Government agencies should be able to use these data, along with natural resources information, to develop cleanup priorities, identify site-specific or temporal constraints, and understand and approve the proposed cleanup plan.

7 SCAT Data Management and Products

SCAT Data Management

The SCAT data management process should result in efficient and effective management of consistent and high-quality data for the shoreline assessment process, and promote their seamless integration into shoreline cleanup planning and operations.

Many products and tools are produced and developed by the SCAT Coordinator, Teams, and Data Managers that vary by spill Type as outlined in Chapter 2 (Type 3 is simple, Type 1 is very complex). Table 4 provides a short description of these products and tools for each spill Type.

SCAT Data Manager

The SCAT Data Manager is the on-scene lead for the management of data and production of materials to convey shoreline conditions and other information collected as part of SCAT activities. The SCAT Data Manager establishes and implements protocols for the documentation, processing, display, and archiving of the shoreline oiling data collected during an incident. The SCAT Data Manager works closely with the SCAT Coordinator and the EU within the Unified Command to design and manage an effective data management system for the shoreline assessment component of the response. See Chapter 4 for more on responsibilities and qualifications.

First 24-48 hrs into response

- Meet with SCAT Coordinator and the EU to establish general expectations, procedures, and accountability for SCAT data management tasks; review division and segment designations; and select and (if necessary modify) SCAT forms and associated documents.
- Evaluate personnel and equipment requirements for data management with SCAT Coordinator.
- Meet with SCAT teams prior to field mobilization to instruct/review field documentation protocols and data forms.
- Provide daily SCAT Data Management reports to SCAT Coordinator and (as appropriate) other members of the EU and Unified Command.
- Ensure that selected SCAT data are made available for response agencies' internal use and to support public affairs products and events.

48 – 72 hrs into response

- With SCAT Coordinator, review data management performance after first SCAT field mobilization; modify forms and protocols as necessary.

Daily Expectations

- Attend daily Unified Command briefings and support the SCAT Coordinator during assignments and updates.

Table 4. List of the types of SCAT data products created during spills of different degrees of complexity. Continued on the next page.

Type of Product	Products/ Tools	Type 3	Type 2	Type 1	Where It Goes	How It's Created
Primary Data Products	**SCAT Field Data Collection**	Paper forms filled out in the field; includes notes and field sketches	Paper forms filled out in the field; includes notes, field sketches or maps, may include tracklines/WPs	Paper forms filled out in the field; or eSCAT if available; includes notes and survey specific field maps with tracklines/WPs	SCAT Coordinator; SCAT Data Manager	Forms filled out in the field by SCAT teams/Data Team generates maps with tracklines/WPs for teams to use as base maps
	SCAT Photographs	Each team organizes their photos into daily folders, includes key photos with their daily report	Each team georeferences and organizes their photos into daily folders on a server	Teams turn in their camera/GPS for Data Team to organize into folders and georeference	SCAT Data Manager	Taken in the field by SCAT Team Members
	Special Field Requests (subsurface oiling data, beach profiles)	None	None	Subsurface oiling and/or beach profiles recorded on response specific forms	SCAT Data Manager	Collected by SCAT teams or Operations
Derived Data Products	**Interim SCAT Daily Summary**	Written summary of segments surveyed and recommendations for treatment	Written summary of segments surveyed and recommendations for treatment	Written summary of segments surveyed and recommendations for treatment	For SCAT Coordinator for discussion at the afternoon Planning Meeting	SCAT Coordinator compiles verbal reports from the Teams
	Shoreline Oiling Maps	Digitize shoreline oiling degrees on digital base map and/or other products (e.g. KMZ)	Digitize shoreline oiling degrees on digital base map and/or other products (e.g. KMZ)	Shoreline oiling map production/tracking by GIS, exported in various formats for distribution	Situation Unit, Documentation, Planning, Operations	Digitize shoreline w/oiling extents either from SCAT database, field notes/sketch maps, spreadsheet
	Shoreline Treatment Recommendation/ Priorities	Map showing segments and attached table with treatment recommendations and priorities	General STRs for different habitats /conditions; detailed maps of treatment segments	STR written for each segment, with consults and approvals at many levels	To EU, then Planning, then IAP	SCAT Coordinator generates this daily
	Shoreline Operational Stage Map	Digitize operational stage on digital base map and/or other products (e.g. KMZ)	Digitize operational stage on digital base map and/or other products (e.g. KMZ)	Operational stage map production/tracking by GIS, exported in various formats for distribution	Situation Unit, Documentation, Planning, Operations	Designation from Operations and SCAT (Stage 1, 2, passive, etc.); database updated; GIS maps created
	Shoreline Oiling & Stage Table	Calcs of shoreline lengths by shoreline type and oiling degree; operational stage	Spreadsheet calcs of shoreline lengths by type and oiling degree; operational stage	GIS calcs of shoreline lengths by type and oiling degree; operational stage	Situation Unit, Documentation, Planning, Operations	Export from database or spreadsheet, then tabulation

Table 4.Cont. List of the types of SCAT data products created during spills of different degrees of complexity.

Type of Product	Products/ Tools	Type 3	Type 2	Type 1	Where It Goes	How It's Created
Planning and Organizational Products	**Shoreline Treatment Guidelines/ Endpoints**	Written document (short)	Written document (long)	Written document (longest)	For UC sign-off (through the EU)	Multi-agency group through consensus
	Shoreline Inspection Form	Paper form per segment with check-offs against cleanup endpoints	Paper form per segment with check-offs against cleanup endpoints	Paper form per segment with check-offs against cleanup endpoints	SCAT Team Sign-off	SCAT Coordinator generates specific form based on cleanup plan/process
	Shoreline Inspection Report	Typed list of sign-off status by segment	Printout of updated spreadsheet list with sign-off status by segment	Printout of updates database and maps with sign-off status	EU then Planning	SCAT Teams
Derived Data Products Data Management Tools	**Sites of Special Concern Maps/Lists**	List/map showing sites of concern/ constraints ID'ed by SCAT/EU	Annotate base map with sites of special concern; use symbols for each type	GIS entry of sites of special concern for maps/export as KMZ file; use symbols for each type	Situation Unit, Documentation, Planning, Operations	ICS 232 and 232a form from EU; digitized in GIS; tracked in Access database
	SCAT Segment/ Division Base Maps	Photocopies of topo maps, Google maps, aerial photos, etc. for SCAT teams to mark on	Computer-generated maps at different scales (graphics computer programs)	Computer-generated maps at different scales with predefined segments (GIS)	SCAT Teams; Planning; Situation Unit	SCAT/Operations designate boundaries; Digitized in GIS; Base maps created
	SCAT Assignment Tracking	Lists of # of teams, members, contact info, assignments	ICS 204 for SCAT Team	ICS 204 for SCAT Team	Planning for input to IAP	SCAT Coordinator generates this daily
	SCAT Equipment Tracking Form	Log of equipment issued to SCAT Teams, with accountable person contact info	Log of equipment issued to SCAT Teams, with accountable person contact info	Log of equipment issued to SCAT Teams, with accountable person contact info	SCAT Coordinator	Simple spreadsheet
	SCAT Data Entry	None; Manual calculations of degree of oiling from SCAT data for each segment	Data entered and manipulated in spreadsheet; calc of oiling degree	Data entered daily into response-specific database; calc of oiling degree; update of GIS data	SCAT Coordinator	SCAT Data Management

- Re-examine staffing requirements and inform the SCAT Coordinator when the data management workload will exceed current staffing levels.
- Provide and receive feedback on data management performance at SCAT and other Unified Command briefings.

SCAT Data Management Team

The SCAT Data Management Team is an on-scene group (with off-site support as needed) of technical experts that assists the SCAT Data Manager with the management of data and production of materials to convey shoreline conditions and other information collected as part of SCAT activities. The SCAT Data Management Team implements protocols for the processing, display, and archiving of the shoreline assessment data collected during an incident and helps to design and implement an effective data management system for the shoreline assessment component of the response. See Chapter 4 for more on responsibilities and qualifications.

First 24 – 48 hrs into response

- Establish file directory structure and file naming conventions for managing documents, data, and photos.
- Coordinate with Situation and Environmental Units for relevant spill response data and map transfers (e.g., high resolution base maps, overflight maps, other data) by email or FTP or manual.
- Inventory locally-available spatial data and maps to provide high-resolution guidance for field teams; identify shoreline access points, restricted areas, and hazards that affect SCAT activities and ensure this information is communicated to appropriate SCAT team leaders.
- Create base maps for field planning & use, including laminated or other weather-resistant versions.
- Establish both on-site backup and off-site, secure FTP repository for all data.
- Develop and maintain Contact List for SCAT Team Members .

48 – 72 hrs into response

- Develop data archival strategy (e.g., offsite external drives/FTP/server, used for ongoing reference and long-term documentation).

Daily Expectations

- Produce daily status maps showing current SCAT deployments and assessment activities; maintain archive copies for distribution and reference.
- Obtain weather from the NOAA National Weather Service and post for morning briefings.
- Manage and QA/QC SCAT teams' GPS tracklogs and waypoints from GPS units and digital photos; process with appropriate software tools (e.g., OziExplorer, GPS Photo Link, HoudahGeo).
- SCAT maps made available in all appropriate formats, including hard copies, PDFs and Google Earth KML/KMZ files.

Shoreline Assessment Summaries

Note that SCAT forms are not always included in the report generated for the Planning and Operations Sections. They need the final products of the survey: the shoreline types and oiling conditions; the treatment methods to be applied; and any ecological or cultural resource concerns. Often two types of data summaries are needed: a tabular summary by cleanup zones; and maps for display. Box 4 is an example SCAT summary report for a simple spill. The types of data that should be included in any tabular summary are:

Date: For some spills, changing conditions will require repeat surveys, so the date of the survey is very important.

Segment Number(s), Name, Division Number, Operations Zone: Use the shoreline segment name. Group segments by Operations Division.

Summary of Oiling Conditions: The oiling condition can rapidly change. You need to describe the oiling condition when the treatment recommendation was made.

Treatment Recommendations: Use standard terms, as listed in the cleanup descriptions in Appendix B.

Site-specific Constraints: Clearly identify these as to location and activity in the field (e.g., do not allow cleanup crews to enter marshes).

Box 4:
Simple SCAT Daily Summary for [date]

Shoreline segments requiring cleanup action. See attached reports for more detail.

BR1 - Re-oiled, mousse and tar balls with 10-15% coverage, no subsurface oil. No cleanup activity present.
RECOMMENDATION: Revisit by cleanup crew doing manual recovery, revisit daily.

BR2 - Re-oiled, 10% coverage of film, mousse, and tar balls, no subsurface oil. No cleanup activity present.
RECOMMENDATION: Revisit by cleanup crew doing manual recovery, revisit daily.

BR3 - 20% tar balls more evenly dispersed as compared to yesterday, no subsurface oil. Small cleanup crew (15 people) present. **RECOMMENDATION:** Continue cleanup.

BR4 - 10-15% tar balls, no subsurface oil. Cleanup activity in progress. **RECOMMENDATION:** Continue cleanup operations.

BR5 - Oil still leaching from South Jetty, snare being deployed and tended. **RECOMMENDATION:** Maintain snare on both south and north side of South Jetty with frequent tending to ensure effective capture of oil leaching from riprap.

EB - No oil observed. Snare is stranded on East Beach near the jetty. **RECOMMENDATION:** Manual recovery of snare and other oily debris washing up.

Aerial photography can be used as a basemap for displaying SCAT data by segment. Oblique photographs of oiled shorelines under their current conditions can be readily obtained during aerial surveys. Figure 17 is an example using oblique photography to delineate cleanup areas and recommendations, from the M/V *Selendang Ayu* spill in Alaska. In this case, available imagery was too coarse in scale or had too much cloud cover, which are issues for much of the remote areas of the Alaska coastline. Figure 18 is an example using vertical imagery, from the T/V *Athos* spill in the Delaware River, November 2004. Although eye-catching and immediately informative, these types of reporting require Team Members with the time and skill to produce them.

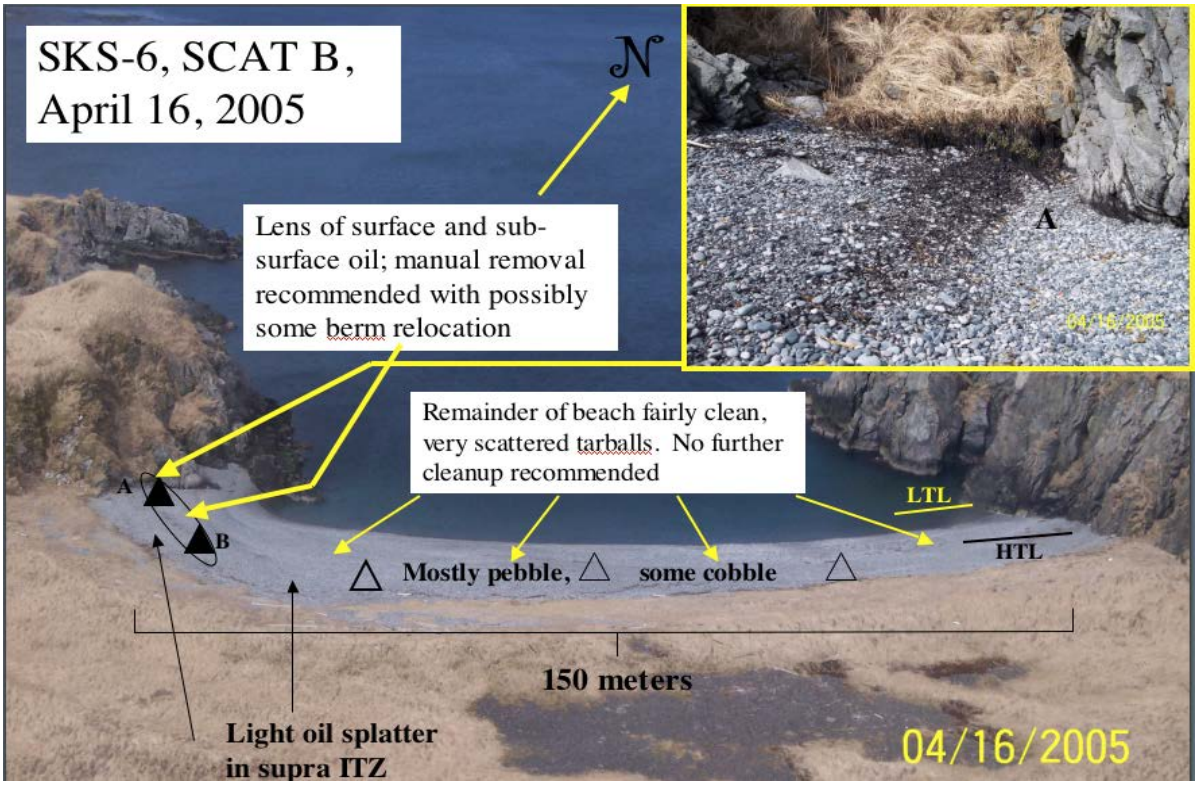

Figure 17. Example of using oblique aerial photographs as the basemap for presenting the results of the SCAT survey at the *M/V Selendang Ayu* spill in Alaska, USA.

You can graphically represent SCAT data on maps and as statistical summaries. Use maps to show the distribution of oiled shoreline and the degrees of oiling. Use computer-mapping software to tabulate the number of miles of shoreline by oiling degree and cleanup status (Table 5). Figure 19 shows an example shoreline oiling map for East San Francisco Bay, CA from the M/V *Cosco Busan* spill in 2006. Standardize definitions for the shoreline oiling categories (modify your definitions using the process outlined in Figure 15). These are important measures for reporting the progress of the cleanup.

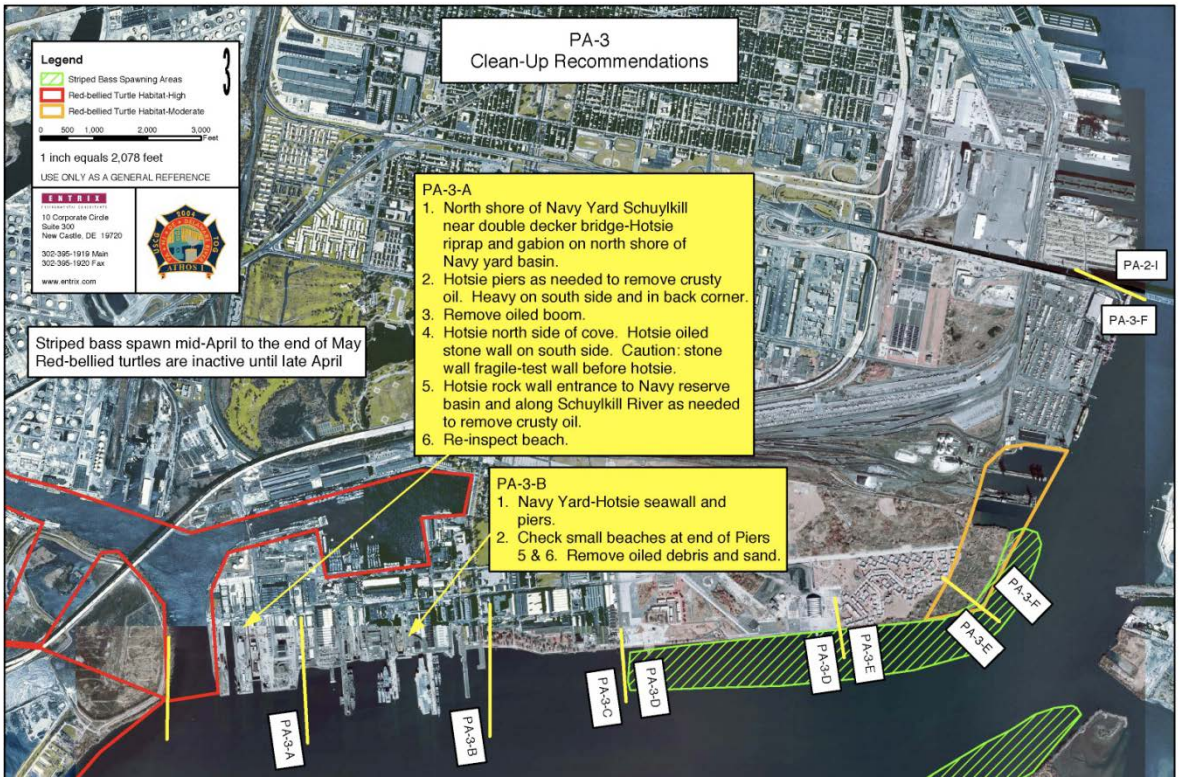

Figure 18. Example of using vertical aerial imagery as the basemap for presenting the results of the SCAT survey at the M/V *Athos 1* oil spill in the Delaware River near Philadelphia, PA.

Table 5. Tabular summary of the miles of shoreline by state and status within the Shoreline Cleanup Completion Plan process for the *Deepwater Horizon* oil spill.

State	Total Segment Length Surveyed	Length of Shoreline by Segments within Status Category (miles)				
		STR Process	SIR1 Process	(Pending Approval) Removal Actions Deemed Complete	Removal Actions Deemed Complete	Operational Pause

8 Planning for Shoreline Assessments

Define the Roles in the Area Contingency Plan

You are encouraged to plan ahead for shoreline assessments through the Area Committee. The Area Contingency Plan can identify the personnel, process, and logistics to be used for shoreline assessments before a spill occurs. It can also pre-approve the use of cleanup methods for special problem areas. This kind of pre-planning should include:

- Identifying staff who are qualified as a SCAT Coordinator; and
- Identifying a pool of government personnel who can represent their agencies' concerns and be available to do shoreline assessments for the duration of a spill. *These personnel must be trained in shoreline processes, SCAT terms, and cleanup methods.*

Process

- Develop a strategy for establishing Operational Divisions and/or segmenting shorelines in your area.
- Pre-approve the use of treatment methods for each shoreline type. Form workgroups to identify special cleanup concerns (e.g., cutting of oiled seaweeds, use of shoreline cleaning agents, recovery of submerged oil), research the cleanup options, and make recommendations on their use for inclusion in planning documents.
- Develop general guidelines for cleanup endpoints.
- Decide how to transition SCAT Teams into Sign-off Teams.

Logistics

- Identify and acquire SCAT equipment.
- Identify the need for air boats, shallow-draft boats, or special vehicles, particularly in remote areas.
- Identify the types of communications needed by field teams (e.g., radios, cellular phones).

Appendix B: Brief Descriptions of Shoreline Cleanup Methods
Appendix C: Shoreline Descriptors, Including Oil Behavior and Response Considerations
Appendix D: Examples of SCAT Forms and Guides
Appendix E: A Primer on Drawing Field Sketches
Appendix F: Example SCAT Field Safety Plan
Appendix G: SCAT Photography Guidelines
Appendix H: SCAT GPS Guidelines
Appendix I: Step-by-Step Guidelines for Filling out the SOS Form

Appendix A: SCAT Equipment Checklist

Shoreline Survey Gear

- Maps or charts of the survey area
- Clipboards and rubber bands
- Pencils, erasers, waterproof markers
- Field forms (code sheets, SOS forms, sketch sheets, photo logs)
- Field estimation charts (sand size, gravel size, percent cover)
- Field notebooks (SCAT write-in-the rain notebooks are best)
- Segment map sheets
- Base sketch maps, if available
- Shovels – long-handled spades for digging pits
- Digital camera; extra batteries
- Photo scale (15 cm)
- Tape measure (30 m)
- Range finder
- Hand-held GPS
- Compass
- Field pack
- Communication device (e.g., radio or cell phone)
- First-aid kit

Personal Gear

- Good rain gear
- Knee-high, rubber boots or hip waders
- Work gloves
- "Tar-off" towelettes or similar hand cleaner
- Hat
- Sunscreen
- Drinking water
- Personal Flotation Device if traveling by water/helicopter
- Personal day pack
- Bug repellent
- Energy bar (nourishment)
- Appropriate cold-weather clothing (as necessary)
- Nitrile gloves

Appendix B: Brief Descriptions of Shoreline Cleanup Methods

Introduction

This section describes methods currently in use during cleanup of oil spills in marine environments and habitats. For each method the following is provided: a summary of the objective in using the method, a general description of the method, applicable habitat types, conditions under which the methods should be used (constraints commonly applied to the use of the method to protect sensitive biological resources), and the environmental effects expected from the proper use of the method. Some of the methods listed require special authorization for use during a spill; appropriate agencies must be contacted about the need for special approvals.

A problem which occurs after all major oil spills is that there is a large quantity of oily wastes and debris that is generated and must be dealt with as part of the response action. A cleanup strategy that minimizes the impact to all sensitive aspects of the environment and minimizes the amount of oily wastes is the most optimal. Each cleanup option should be examined with the problem of waste generation and disposal in mind.

Additional guidance for the application of shoreline cleanup methods appropriate for each shoreline type can be found in oil spill manuals and guidance documents by the International Maritime Organization, International Petroleum Industry Environmental Conservation Association, and NOAA (listed in the references section). Methods listed are:

- ❑ Natural Recovery
- ❑ Barriers/Berms
- ❑ Physical Herding
- ❑ Manual Oil Removal
- ❑ Mechanical Oil Removal
- ❑ Sorbents
- ❑ Vacuum
- ❑ Debris Removal
- ❑ Sediment Reworking/Tilling
- ❑ Vegetation Cutting/Removal
- ❑ Flooding
- ❑ Low-Pressure, Ambient-Water Flushing
- ❑ High-Pressure, Ambient-Water Flushing
- ❑ Low-Pressure, Hot-Water Flushing
- ❑ High-Pressure, Hot-Water Flushing
- ❑ Steam Cleaning
- ❑ Sand Blasting
- ❑ Elasticity Modifiers
- ❑ Herding Agents
- ❑ Solidifiers
- ❑ Surface Washing Agents
- ❑ Nutrient Enrichment (Biostimulation)
- ❑ Natural Microbe Seeding (Bioaugmentation)
- ❑ In-situ Burning

Natural Recovery

Objective
No attempt to remove any stranded oil in order to minimize impact to the environment, or because there is no effective method for cleanup. Oil is left in place to degrade naturally.

Description
No action is taken, although monitoring of contaminated areas may be required.

Applicable Habitat Types
All habitat types.

When to Use
When natural removal rates are fast (e.g., gasoline evaporation, high energy coastlines), when the degree of oiling is light, or when cleanup actions will do more harm than natural recovery.

Biological Constraints
This method may be inappropriate for areas used by high numbers of mobile animals (birds, marine mammals) or endangered species.

Environmental Effects
Same as from the oil alone.

Waste Generation
None.

Barriers/Berms

Objective

To prevent entry of oil into a sensitive area or to divert oil to a collection area.

Description

A physical barrier (other than a boom) is placed across an area to prevent oil from passing. Barriers can consist of earthen berms, trenches, sand bags, wood/metal sheets, Hesco baskets, or filter fences. When it is necessary for water to pass because of water volume, underflow or overflow dams are used.

Applicable Habitat Types

At the mouths of creeks or streams to prevent oil from entering, or to prevent oil in the creek from being released into offshore waters. Also, on beaches where a berm can be built above the high tide line to prevent oil from overwashing the beach and entering a sensitive back-beach habitat (e.g., lagoon).

When to Use

When the oil threatens sensitive habitats and other barrier options are not feasible. However, where they are placed on shorelines exposed to wave action, they should be removed prior to storm activity.

Biological Constraints

Responders must minimize disturbance to bird and sea turtle nesting areas, beaver dams, or other sensitive areas. Placement of dams and filter fences could cause excessive physical disruptions, particularly in wetlands.

Environmental Effects

May disrupt or contaminate sediments and adjacent vegetation. The natural beach (or shore) profile should be restored (may take weeks to months on gravel beaches). Trenching may enhance penetration of oil and quantity of contaminated sediments. May require a permit from the U.S. Army Corps of Engineers.

Waste Generation

Sediment barriers will become contaminated on the oil side and filter fence materials will have to be disposed of as oily wastes.

Physical Herding

Objective

To free any oil trapped in debris or vegetation on water; to direct floating oil towards containment and recovery devices; or to divert oil from sensitive areas.

Description

Plunging water jets, water or air hoses, and propeller wash can be used to dislodge trapped oil and divert or herd it to containment and recovery areas. May emulsify the oil. Mostly conducted from small boats, although larger boats such as tugs can be used to generate stronger currents or influence larger areas (such as oil trapped deep under piers).

Applicable Habitat Types

In nearshore areas where there are little or no currents, and in and around man-made structures such as wharves and piers.

When to Use

In low-current or stagnant water bodies, to herd oil toward recovery devices. In high-current situations, used to divert floating oil away from sensitive areas.

Biological Constraints

When used near shore and in shallow water, must be careful not to disrupt bottom sediments or submerged aquatic vegetation.

Environmental Effects

May generate high levels of suspended sediments and mix them with the oil, resulting in deposition of contaminated sediments in benthic habitats.

Waste Generation

None.

Manual Oil Removal/Cleaning

Objective
To remove oil with hand tools and manual labor.

Description
Removal of surface oil using hands, rakes, shovels, buckets, scrapers, sorbents, pitch forks, etc., and placing in containers. No mechanized equipment is used except for transport of workers and collected oil and debris. Includes underwater recovery of submerged oil by divers, for example, with hand tools.

Applicable Habitat Types
Can be used on all habitat types.

When to Use
Light to moderate oiling conditions for stranded oil, or heavy oils on water or submerged on the bottom, that have formed semi-solid or solid masses and that can be picked up manually.

Biological Constraints
Foot traffic over sensitive areas (wetlands, tidal pools, etc.) should be restricted or prevented. There may be periods when shoreline access should be avoided, such as during bird nesting. Special permission or archaeological monitoring will be needed to dig in areas with known cultural resources

Environmental Effects
Minimal, if surface disturbance by responders and waste generation is controlled.

Waste Generation
May generate significant quantities of oil mixed with sediment and debris which must be properly disposed of or treated. Decontamination of hand tools may produce oily wastewater that must be treated properly. Worker personal protective gear is usually disposed of daily or decontaminated and the resulting oily wastewater treated properly.

Mechanical Oil Removal

Objective

To remove oil from shorelines, and bottom sediments using mechanical equipment.

Description

Oil and oiled materials are collected and removed using mechanical equipment not specifically designed for pollution response, such as backhoes, graders, bulldozers, dredges, draglines, beach cleaners, etc. Requires systems for temporary storage, transportation, and final treatment and disposal of collected material.

Applicable Habitat Types

On land, possible wherever surface sediments are both amenable to, and accessible by, heavy equipment. For submerged oil, used in sheltered areas where oil accumulates. On water, used on viscous or solid contained oil.

When to Use

When large amounts of oiled materials must be removed. Care should be taken to remove sediments only to the depth of oil penetration, which can be difficult with heavy equipment. Should be used carefully where excessive sediment removal may erode the beach or shore. Mechanical removal of buried oil consists of the removal and sidecasting of clean overburden, removal of oiled sediments by either manual or mechanical methods, and the replacement of the clean overburden. Care is also needed to minimize further oil penetration from uncontrolled vehicle traffic.

Biological Constraints

Heavy equipment use may be restricted in sensitive habitats (e.g., wetlands, soft substrates) or areas used by protected species. Special permission or archaeological monitoring will be needed to use equipment to excavate in areas with known cultural resources. Generation of high suspended sediment concentrations adjacent to seagrass beds or coral reef habitats may be prohibited. Access and work areas may be restricted, or traffic corridors designated, to prevent physical disturbance to adjacent, unoiled areas. The noise generated by the mechanical equipment may present a constraint as well.

Environmental Effects

The equipment is heavy, with many support personnel required. May be detrimental if excessive sediments are removed without replacement. All organisms in the sediments will be affected, although the need to remove the oil may make this response method the best overall alternative. Resuspension of exposed oil and fine-grained, oily sediments can affect adjacent bodies of water.

Waste Generation

Can generate large quantities of contaminated sediment and debris that must be treated or landfilled. The amount of waste generated by this cleanup option should be given careful consideration by response planners when reviewing potential environmental impacts of the oily wastes, debris, and residues.

Sorbents

Objective

To remove surface oil by absorption by oleophilic (oil-attracting) material placed at the waterline or on treated surfaces. This method can also include use of loose, organic sorbents on oiled vegetated surfaces to reduce the risk of wildlife oiling.

Description

Sorbent material is placed on the floating oil or water surface, allowing it to sorb oil or is used to wipe or dab stranded oil. Forms include sausage boom, pads, rolls, sweeps, snares, and loose granules or particles. These products can be synthetically produced or be natural substances. Efficacy depends on the capacity of the particular sorbent, wave or tidal energy available for lifting the oil off the substrate, and oil type and stickiness. Recovery of all sorbent material is mandatory. Loose, organic sorbents may be applied to the oil surface and lightly raked into the oil, then removed.

Applicable Habitat Types

Can be used on any habitat or environment type. However, when deployed in areas exposed to wave action, they need to be firmly anchored or removed during storms, to prevent stranding on the shoreline, particularly along wetlands.

When to Use

When oil is free-floating close to shore or stranded on shore. The oil must be able to be released from the substrate and sorbed by the sorbent. As a secondary treatment method after gross oil removal, and in sensitive areas where access is restricted. Selection of sorbent varies by oil type: heavy oils only coat surfaces, requiring a high surface area to be effective, whereas lighter oils can penetrate sorbent material.

Biological Constraints

Access for deploying and retrieving sorbents should not adversely affect wildlife. Application in soft or sensitive habitats will require use of walking boards. Sorbents should not be used in a fashion that would endanger or trap wildlife. Sorbents left in place too long can break apart and present an ingestion hazard to wildlife.

Environmental Effects

Physical disturbance of habitat during deployment and retrieval. Improperly deployed or tended sorbent material can crush or smother sensitive organisms.

Waste Generation

Must be regularly collected for proper disposal, so care should be taken to select and use sorbents effectively. Prevent overuse and generation of large amounts of lightly oiled sorbents. Waste-to-energy should be emphasized rather than disposal.

Vacuum

Objective

To remove oil pooled on a shoreline substrate or subtidal sediments.

Description

A vacuum unit is attached via a flexible hose to a suction head that recovers free oil. The equipment can range from small, portable units that fill individual 55-gallon drums to large supersuckers that are truck- or vessel-mounted and can generate enough suction to lift large rocks. Removal rates from substrates can be extremely slow.

Applicable Habitat Types

Any accessible habitat type. May be mounted on vessels (including airboats) for water-based operations, on trucks driven to the recovery area, or hand-carried to remote sites.

When to Use

When oil is stranded on the substrate, pooled against a shoreline, concentrated in trenches or trapped in vegetation. Usually requires shoreline access points.

Biological Constraints

Special restrictions should be established for areas where foot traffic and equipment operation may be damaging, such as soft substrates. Operations in wetlands must be very closely monitored, and a site-specific list of procedures and restrictions developed to prevent damage to vegetation, such as use of walking boards, monitoring to prevent excessive damage to vegetation and soils, and use in combination was low-pressure flushing to lift the oil off the substrate and vegetation.

Environmental Effects

Minimal, if foot and vehicular traffic are controlled and minimal substrate/vegetation is damaged or removed.

Waste Generation

Collected oil and or oil/water mix will need to be stored temporarily prior to recycling or disposal. Oil may be recyclable; if not, it will require disposal in accordance with local regulations. Large amounts of water are often recovered, requiring separation and treatment.

Debris Removal

Objective

To remove debris in path of spill prior to oiling, and to remove contaminated debris from the shoreline and water surface.

Description

Manual or mechanical removal of debris (driftwood, seaweed, trash, wreckage) from the shore or water surface. Can include cutting and removal of oiled logs.

Applicable Habitat Types

Can be used on any habitat or environment type where access is safe.

When to Use

When debris is heavily contaminated and provides a potential source of secondary oil release; an aesthetic problem; a source of contamination for other resources that use the area such as birds and small mammals; likely to clog skimmers; or likely to cause safety problems for responders. Used in areas of wrack accumulation on beaches prior to oiling to minimize the amount of oiled debris to be handled.

Biological Constraints

Foot traffic over sensitive areas (wetlands, spawning grounds) must be restricted. May be periods when entry should be denied (spawning periods, influx of large numbers of migratory waterfowl). Debris may also be a habitat and an important source of prey (for example, shorebirds feeding in wrack on beaches). Unoiled or lightly oiled debris should not be removed.

Environmental Effects

Physical disruption of substrate, especially when mechanized equipment must be deployed to recover a large quantity of debris.

Waste Generation

Will generate contaminated debris (volume depends on what, and how much, is collected, e.g., logs, brush). Unless there is an approved hazardous waste incinerator that will take oily debris, burning will seldom be allowed, especially on-site burning. However, this option should still be explored, especially for remote locations, with the appropriate state or federal agencies that must give approvals for burning.

The advantage of pre-spill debris collections is that waste disposal requirements will likely be less restrictive than if the debris is oiled. Once oiled, the debris is likely to be handled as a hazardous waste.

Sediment Reworking/Tilling

Objective

To break up oily sediments and surface oil deposits, increasing their surface area, and bringing deeper subsurface oil layers to the surface, thus enhancing the rate of degradation through aeration. Also, to increase the rate of sediment re-working by wave action.

Description

The oiled sediments are roto-tilled, disked, or otherwise mixed using mechanical equipment or manual tools. Along beaches, oiled sediments may also be pushed to the lower intertidal zone to enhance natural cleanup by wave activity (surf washing). On gravel beaches, the process may be aided with high-volume flushing.

Applicable Habitat Types

On any sedimentary substrate that can support mechanical equipment or foot traffic and hand tilling.

When to Use

On sand to gravel beaches with subsurface oil, where sediment removal is not feasible (due to erosion or transportation and disposal problems). On sand beaches where the sediment is stained or lightly oiled. Also appropriate for sites where the oil is stranded above the normal high waterline, so that the sediments can be reworked by wave action.

Biological Constraints

Avoid use on shores near sensitive wildlife habitats, such as fish-spawning areas or bird-nesting or concentration areas because of the potential for release of oil and oiled sediments into adjacent bodies of water. Should not be used adjacent to sensitive subtidal habitats such as shellfish beds, seagrass, or coral reefs.

Environmental Effects

Mixing of oil into sediments could further expose organisms that live below the original layer of oil. Repeated reworking could delay re-establishing of these organisms. Refloated oil and oily suspended sediments from treated sites could contaminate adjacent waterbodies and shorelines.

Waste Generation

None.

Vegetation Cutting/Removal

Objective

To remove portions of oiled vegetation or oil trapped in vegetation to prevent oiling of wildlife or secondary oil releases.

Description

Oiled vegetation is cut with weed trimmers, blades, etc., and picked or raked up and bagged for disposal. May require use of loose, organic sorbents to recover oil that is exposed and poses contact hazards to wildlife.

Applicable Habitat Types

Habitats composed of vegetation, such as wetlands, seagrass beds, and kelp beds that contain emergent, herbaceous vegetation or floating, aquatic vegetation.

When to Use

When the risk of oiled vegetation contaminating wildlife is greater than the value of the vegetation that is to be cut, and there is no less-destructive method that removes or reduces the risk to acceptable levels. Also, to remove thick oil residues under the oiled vegetation.

Biological Constraints

Operations must be strictly monitored to minimize the degree of root destruction and mixing of oil deeper into the sediments. Any foot traffic on sensitive substrates will require use of walking boards. Access in bird-nesting areas should be restricted during nesting seasons. Cutting only the oiled portions of the plants and leaving roots and as much of the stem as possible minimizes impact to plants.

Environmental Effects

Vegetation removal will destroy habitat for many animals. Cut areas will have reduced plant growth and, in some instances, plants may be killed. Cutting at the base of the plant stem may allow oil to penetrate the substrate, causing subsurface contamination. Along exposed sections of shoreline, the vegetation may not recover, resulting in erosion and habitat loss. Trampled areas will recover much more slowly.

Waste Generation

Cut portions of oiled plants must be collected and disposed of properly.

Flooding/Deluge

Objective

To lift and wash oil stranded on land to the water's edge for collection.

Description

A perforated header pipe or hose is placed above the oiled shore or bank. Ambient-temperature water is pumped through the header pipe at low pressure and flows downslope to the water where any released oil is trapped by booms and recovered by skimmers or other suitable equipment. On porous sediments, water flows through the substrate, pushing loose oil ahead of it. On saturated, fine-grained sediments, the technique becomes more of a surface oil lifting and flushing.

Applicable Habitat Types

All shoreline types where the equipment can be effectively deployed. Not effective in steep intertidal areas.

When to Use

In heavily oiled areas when the oil is still fluid and adheres loosely to the substrate, and where oil has penetrated into gravel sediments. This method is frequently used with other washing techniques (low- or high-pressure, cold-to-hot-water flushing).

Biological Constraints

Special care should be taken to recover oil where nearshore habitats contain rich biological communities. Not appropriate for soft, muddy substrates.

Environmental Effects

Habitat may be physically disturbed by foot traffic during operations and smothered by sediments washed down the slope. If containment methods are not sufficient, oil and oiled sediments may be flushed into adjacent areas. Flooding may cause sediment loss and erosion of the shoreline and shallow rooted vegetation. Oiled sediment may be transported to nearshore areas, contaminating them and burying benthic organisms.

Waste Generation

Depends on the effectiveness of the collection method.

Low-Pressure, Ambient-Water Flushing

Objective

To remove fluid oil that has adhered to the substrate or man-made structures, pooled on the surface, or become trapped in vegetation.

Description

Ambient-temperature water is sprayed at low pressures (<10 pounds per square inch [psi] or <72 kilopascals [kpa]), usually from hand-held hoses, to lift oil from the substrate and float it to the water's edge for recovery by skimmers, vacuum, or sorbents. Can be conducted from barges with long-reach spray systems. Usually used with a flooding system to prevent released oil from re-adhering to the substrate downstream of the treatment area.

Applicable Habitat Types

On sediment substrates, riprap, and solid, man-made structures, where the oil is still fluid. In wetlands and along vegetated banks where oil is trapped in vegetation.

When to Use

Where fluid oil is stranded onshore or floating on shallow intertidal areas.

Biological Constraints

May need to restrict use so that the oil/water effluent does not drain across sensitive intertidal habitats, and that mobilized sediments do not affect rich subtidal communities. Use from boats will reduce the need for foot traffic in soft substrates and vegetation. Flushed oil must be recovered to prevent further oiling of adjacent areas.

Environmental Effects

If containment methods are not sufficient, oil and oiled sediments may be flushed into adjacent areas. Flooding may cause sediment loss and erosion of the shoreline and shallow rooted vegetation. Some trampling of substrate and attached biota may occur.

Waste Generation

Depends on the effectiveness of the collection method.

High-Pressure, Ambient-Water Flushing

Objective

To remove oil that has adhered to hard substrates or man-made structures.

Description

Similar to low-pressure flushing, except that water pressure is 100-1,000 psi (720-7,200 kpa). High-pressure spray will more effectively remove sticky or viscous oils. If low water volumes are used, sorbents are placed directly below the treatment area to recover the oil.

Applicable Habitat Types

On bedrock, man-made structures, and gravel substrates.

When to Use

When low-pressure flushing is not effective at removing adhered oil, which must be removed to prevent continued oil release or for aesthetic reasons. When a directed water jet can remove oil from hard-to-reach sites.

Biological Constraints

May need to restrict flushing so that the oil does not drain across sensitive habitats. Flushed oil must be recovered to prevent further oiling of adjacent areas. Should not be used directly on attached algae nor rich, intertidal areas.

Environmental Effects

All attached animals and plants in the direct spray zone will be removed, even when used properly. May drive oil deeper into the substrate or erode fine sediments from shorelines if water jet is improperly applied. If containment methods are not sufficient, oil and oiled sediments may be flushed into adjacent areas. Some trampling of substrate and attached biota will occur.

Waste Generation

Depends on the effectiveness of the collection method.

Low-Pressure, Hot-Water Flushing

Objective

To remove non-liquid/non-fluid oil that has adhered to the substrate or man-made structures, or pooled on the surface.

Description

Hot water (90°F [32°C] up to 170°F [75°C]) is sprayed with hoses at low pressures (<10 psi [<72 kpa]) to liquefy and lift oil from the substrate and float it to the water's edge for recovery by skimmers, vacuums, or sorbents. Used with flooding to prevent released oil from re-adhering to the substrate.

Applicable Habitat Types

On bedrock, sand to gravel substrates, and man-made structures.

When to Use

Where heavy, but relatively fresh, oil is stranded onshore. The oil must be heated above its pour point so it will flow. Less effective on sticky oils.

Biological Constraints

Avoid wetlands or rich intertidal communities so that the hot oil/water effluent does not contact sensitive habitats. Operations from boats will help reduce foot traffic in soft substrates and vegetation. Flushed oil must be recovered to prevent further oiling of adjacent areas. Should not be used directly on attached algae or in rich, intertidal areas.

Environmental Effects

Hot water contact can kill attached animals and plants. If containment methods are not sufficient, oil may be flushed into adjacent areas. Flooding may cause sediment loss and erosion of the shoreline and shallow rooted vegetation. Some trampling of substrate and biota will occur.

Waste Generation

Depends on the effectiveness of the collection method.

High-Pressure, Hot-Water Flushing

Objective

To mobilize weathered and viscous oil strongly adhered to surfaces.

Description

Hot water (32°C up to 77°C) is sprayed with hand-held wands at pressures greater than 720 kpa. If used without water flooding, this procedure requires immediate use of vacuum or sorbents to recover the oil/water runoff. When used with a flooding system, the oil is flushed to the water surface for collection by skimmers, vacuum, or sorbents.

Applicable Habitat Types

Gravel substrates, bedrock, and man-made structures.

When to Use

When oil has weathered to the point that warm water at low pressure no longer effectively removes oil. To remove viscous oil from man-made structures for aesthetic reasons.

Biological Constraints

Use should be restricted so that the oil/water effluent does not drain across sensitive habitats (damage can result from exposure to oil, oiled sediments, and hot water). Should not be used directly on attached algae nor rich intertidal areas. Released oil must be recovered to prevent further oiling of adjacent habitats.

Environmental Effects

All attached animals and plants in the direct spray zone will be removed or killed, even when used properly. Oiled sediment may be transported to shallow nearshore areas, contaminating them and burying benthic organisms.

Waste Generation

Depends on the effectiveness of the collection method.

Steam Cleaning

Objective
To remove heavy residual oil from solid substrates or man-made structures.

Description
Steam or very hot water (171°F [77°C] to 212°F [100°C]) is sprayed with hand-held wands at high pressure (2,000 psi [14,400 kpa]). Water volumes are very low compared to flushing methods.

Applicable Habitat Types
Man-made structures such as seawalls and riprap.

When to Use
When heavy oil residue must be removed for aesthetic reasons, and when hot-water flushing is not effective, and limited biota are present on the treatment area.

Biological Constraints
Not to be used in areas of soft substrates, vegetation, nor high biological abundance directly on, or below, the structure.

Environmental Effects
Complete destruction of all organisms in the spray zone. Difficult to recover all released oil. If containment methods are not sufficient, oil may be flushed into nearshore areas.

Waste Generation
Depends on the effectiveness of the collection method. Usually sorbents are used, generating significant waste volumes.

Sand Blasting

Objective

To remove heavy residual oil from solid substrates or man-made structures.

Description

Use of sandblasting equipment to remove oil from the substrate. May include recovery of used (oiled) sand.

Applicable Habitat Types

On heavily oiled bedrock and artificial structures such as seawalls and riprap.

When to Use

When heavy oil residue must be cleaned for aesthetic reasons, and even steam cleaning is not effective.

Biological Constraints

Not to be used in areas of soft substrates, vegetation, nor high biological abundance directly below, or adjacent to, the structures.

Environmental Effects

Complete destruction of all organisms in the blast zone. Possible smothering of organisms by sand in adjacent areas. Unrecovered, used sand will introduce oiled sediments into the adjacent habitat. Oiled sediment may be transported to shallow nearshore areas, contaminating them and burying benthic organisms.

Waste Generation

Will need to recover and dispose of oiled sand used in blasting.

Elasticity Modifiers

Objective

To impart visco-elastic properties to floating oil, thereby increasing skimming rates.

Description

The liquid product is applied at a rate of 1:13 to 1:150 product:oil ratio, depending on the oil type. Some mixing is required and is usually provided by the water spray during application. Treated oil is gelatinous, or semi-solid, but still fluid; there is no chemical change in the oil. The primary purpose is to increase skimmer efficiency removal rates while minimizing water recovery amounts. Increases the efficiency of some skimmers, but may clog other skimmers, pumps, and storage containers.

Applicable Habitat Types

On all water environments where oil can be contained for skimming. Not for use on wetlands nor debris because of increased adhesive properties of the treated oil.

When to Use

When skimmer efficiency is low. Must be used with booming or other physical containment. Ideal for use on this slicks of light refined oils that are very difficult to recover with mechanical equipment or sorbents. Requires RRT approval for use.

Biological Constraints

Not suitable for vegetated shores or where there is extensive debris mixed in the oil. Should be avoided when birds or other wildlife cannot be kept away from the treated oil.

Environmental Effects

May increase the smothering effect of oil on organisms; therefore, the treatment should be considered only where recovery of the treated oil is likely.

Waste Generation

If skimming efficiency is increased, will reduce the volume of water in oil/water collections. Effects on recycling of oil treated with elasticity modifiers is unknown.

Surface Collecting Agents

Objective

To collect or herd oil into a smaller area and thicker slick in order to increase recovery. Can be used to herd oil away from sensitive areas or to help keep oil contained when it is necessary to move a boom.

Description

These agents, which are insoluble surfactants and have a high spreading pressure, are applied in small quantities (1-2 gallons per lineal mile [2.5-5 liters per lineal kilometer]) to the clean water surrounding the edge of a fresh oil slick. They contain the oil, prevent spreading, but do not hold the spill in place. Hand-held or vessel-mounted systems can be used. Must be applied early in spill, when oil is still fluid.

Applicable Habitat Types

On all still water environments.

When to Use

Potential use for collection and protection. For collection, used to push slicks out from under docks and piers where it has become trapped, or in harbors where the equipment is readily accessible for use early in the spill. For protection in low-current areas, used to push slicks away from sensitive resources such as wetlands. Also used in ice environments to thicken oil. Not effective in fast currents, rough seas, or rainfall.

Biological Constraints

Not suitable for use in very shallow water or fish-spawning areas.

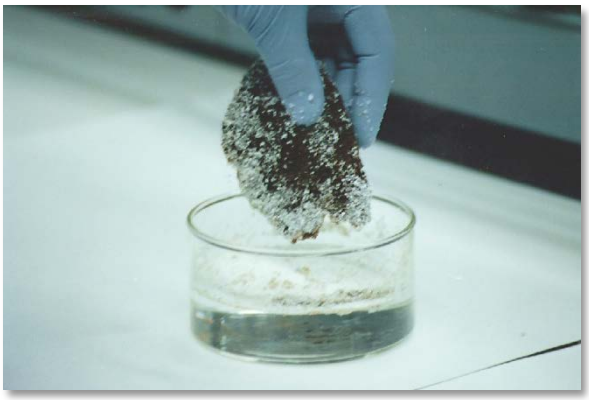
Environmental Effects

Direct acute toxicity to surface-layer organisms possible, though available products vary greatly in their aquatic toxicity.

Waste Generation

Same as for manual oil recovery.

Solidifiers



Objective

To change the physical state of spilled oil from a liquid to a solid to increase recovery rates.

Description

Chemical agents (polymers) are applied to oil at rates of 10-50 percent or more, solidifying the oil in minutes to hours. Various broadcast systems, such as leaf blowers, water cannons, or fire suppression systems, can be modified to apply the product over large areas. Can be applied to both floating and stranded oil. Mixing is usually needed and can be done with a strong water spray. Can be placed in booms, pads, pillows, and socks and used like a sorbent.

Applicable Habitat Types

All water environments, bedrock, sediments, and artificial structures.

When to Use

To immobilize the oil prevent refloating from a shoreline, penetration into the substrate, or further spreading. However, the oil may not fully solidify unless the product is well mixed with the oil, and may result in a mix of solid and untreated oil. Generally not used on heavy oil spills that are already viscous. Requires RRT approval.

Biological Constraints

Must be able to recover all treated material.

Environmental Effects

Available products are insoluble and have very low aquatic toxicity. Unrecovered solidified oil may have longer impact because of slow weathering rates. Physical disturbance of habitat may occur during application and recovery in soft sediments where foot traffic is used.

Waste Generation

If skimming efficiency is increased, solidifiers may reduce the volume of water collected during oil recovery. Oil treated with solidifiers is typically disposed of in landfills.

Surface Washing Agents

Objective

To increase the efficiency of oil removal from contaminated substrates.

Description

Special formulations are applied to the substrate, as a presoak and/or flushing solution, to soften or lift weathered or heavy oils from the substrate to enhance flushing methods. The intent is to lower the water temperature and pressure required to mobilize the oil from the substrate during flushing. Some agents will disperse the oil as it is washed off the beach, others will not.

Applicable Habitat Types

On any habitat where water flooding and flushing procedures are applicable. Has been used to increase the removal of oil adhered to vegetation.

When to Use

When the oil has weathered to the point where it cannot be removed using ambient water temperatures and low pressures. This approach may be most applicable where flushing effectiveness decreases as the oil weathers. Requires RRT approval for use.

Biological Constraints

When the product does not disperse the oil into the water column, the released oil must be recovered from the water surface. Use should be restricted so that the oil/water effluent does not drain across sensitive habitats. Other concerns are where suspended sediment concentrations are high, near wetlands, and near sensitive nearshore resources.

Environmental Effects

The toxicity and effects on dispersability of treated oil vary widely among products. Selection of a product should take into consideration the toxicity of the product.

Waste Generation

Because treated oil must be recovered, waste generation is a function of recovery method, which often includes sorbents.

Nutrient Enrichment (Biostimulation)

Objective

To accelerate the rate of oil degradation due to natural microbial processes by adding nutrients (generally nitrogen and phosphorus) that stimulate microbial growth.

Description

Liquid products are diluted in water and applied with spray or injection systems. Dry products may be applied by hand or spray systems. Oleophilic fertilizers are sprayed neat directly on the oiled surface. The frequency of nutrient addition is determined by monitoring pore water so that the nitrate-N concentration are in the range of 2-10 milligrams per liter. Regular tilling or other means of aeration may be needed to maintain minimum oxygen levels, break up the oil residues, and mix the nutrients with the oiled sediments.

Applicable Habitat Types

On any shoreline habitat type where access is allowed and nutrients are deficient.

When to Use

Only when nutrients are limiting the rates of natural microbial degradation. On moderately to heavily oiled substrates, after other techniques have been used to remove free product; on lightly oiled shorelines, where other techniques are destructive or ineffective; and where nutrients limit natural attenuation. Most effective on light to medium crude oils and fuel oils. Less effective where oil residues are thick. Not considered for gasoline spills, which evaporate rapidly. Fertilizers can increase the growth of vegetation, which could speed the oil degradation by phyto-remediation. Biodegradation of hydrocarbons requires: oil-degrading microbes (which naturally occur in the coastal and marine environment), nutrients (nitrogen and phosphorus), oxygen, moisture, and time, any of which can be limiting. Requires RRT approval for use.

Biological Constraints

Avoid using ammonia-based fertilizers at highly elevated concentrations because un-ionized ammonia is toxic to aquatic life at very low levels. Nitrate is an equally good nitrogen source, minus the ecotoxicity. If nutrients are applied properly with monitoring, eutrophication should not be a problem. Only nutrient additives proven to be nontoxic and effective in either the lab or the field should be used. Check fertilizers for their metal content because some common products contain relatively high levels of metals. Contact toxicity of oleophilic nutrients may restrict their use, as other chemicals in the product could be more toxic to aquatic organisms in the presence of oil.

Environmental Effects

Detrimental effects to shoreline from foot or vehicle traffic caused by workers applying nutrients (unless nutrients are sprayed from a vessel or aircraft). No wastes generated.

Natural Microbe Seeding (Bioaugmentation)

Objective

A form of bioremediation used to accelerate natural microbial degradation of oil by adding high numbers of oil-degrading microorganisms.

Description

Formulations containing specific hydrocarbon-degrading microbes are added to the oiled area because indigenous hydrocarbon degraders are low in number, or those that are present cannot degrade the oil effectively. Because microbes require nitrogen and phosphorus to convert hydrocarbons to biomass, formulations containing these oil degraders must also contain adequate nutrients. Bioaugmentation has not been demonstrated in the scientific literature to be effective on marine and coastal oil spills.

Bioaugmentation appears less effective than biostimulation because: 1) hydrocarbon degraders are ubiquitous in nature and, when an oil spill occurs at a given site, the influx of oil will cause an immediate increased response in the hydrocarbon degrading populations; but, 2) if nutrients are in limited supply, the rate of oil biodegradation will be less than optimal; thus, 3) supplying nutrients will enhance the process initiated by the spill, but adding microorganisms will not, because they still lack the necessary nitrogen and phosphorus to support growth.

Applicable Habitat Types

Insufficient information on impacts or effectiveness to make a judgment on habitat.

When to Use

There is insufficient information on impact or effectiveness of this method to make a judgment on when to use it. Requires RRT approval for use.

Biological Constraints

Avoid using ammonia-based fertilizers adjacent to water bodies because un-ionized ammonia is toxic to aquatic life at very low levels. Nitrate is an equally good nitrogen source, minus the ecotoxicity. If the product containing nutrients is applied properly with adequate monitoring, eutrophication should not be a problem; however, toxicity tests should be evaluated carefully, as other chemicals in the product would be toxic to aquatic organisms.

Environmental Effects

Detrimental physical effects to shoreline from foot or vehicle traffic cause by workers applying bioaugmentation product (unless nutrients are applied from a vessel or aircraft). No wastes generated.

In-situ Burning

Objective

To remove oil from the water surface or habitat by burning the oil in place.

Description

Oil floating on the water surface is collected into slicks at least 2-3 mm thick and ignited. The oil can be contained in fire-resistant booms, or by natural barriers such as ice or the shoreline. On land, oil can be burned when it is on a combustible substrate such as vegetation, logs, or other debris. Oil can be burned from non-flammable substrates using a burn promoter. On sedimentary substrates, it may be necessary to dig trenches for oil to accumulate in pools to a thickness that will sustain burning. Heavy oils are more difficult to ignite but can sustain a burn once ignited. Emulsified oils may not ignite or sustain a burn when the water content is great than about 25%. Where sinking of the burn residue is of concern, it may be possible to collect the burn residues while they are still hot and buoyant.

Applicable Habitat Types

On most habitats except dry, muddy substrates where heat may impact the biological productivity of the habitat. May increase oil penetration into permeable substrate. Generally not suitable for woody vegetation such as mangroves and hardwood swamps.

When to Use

On floating slicks, early in the spill event when the oil can be kept thick enough to sustain the burn. Removal rates of 50,000 gallons per hour can be achieved for a burn area of 10,000 square feet (930 square meters). On land, where there is heavy oil in areas neither amendable nor accessible to physical removal, and the oil must be removed quickly. Under ideal condition, removal efficiencies can exceed 90%. There are many potential applications for spills in ice. Requires RRT approval for use during coastal and marine spills.

Biological Constraints

Most biota in the burn area will be impacted. The possible effects of smoke on wildlife and populated areas should be evaluated. In vegetated and mud habitats, a water layer will minimize impacts to sediments and roots

Environmental Effects

Temperature and air quality effects are likely to be localized and short-lived. Toxicological impact from burn residues may be of concern, depending on the oil type and amount of residue. On-water, burn residues are likely to sink. Studies have predicted that ~50% of international crudes would sink in seawater after cooling. On land, removal of residues and unburned oil is often necessary for crude and heavy oils. The success of the burn in vegetated habitats is a function of the season of the burn, vegetation type, and water level at the time of the burn.

Waste Generation

Any residues remaining after burning will need to be collected and landfilled, but with an efficient burn will be a small fraction of the original oil volume.

Appendix C: Shoreline Descriptors, Including Oil Behavior and Response Considerations

EXPOSED ROCKY SHORES — ESI =1A

Description

- The intertidal zone is steep (greater than 30 degree slope) and narrow with very little width
- Sediment accumulations are uncommon and usually ephemeral, because waves remove the debris that has slumped from the eroding cliffs
- There is strong vertical zonation of intertidal biological communities
- Species density and diversity vary greatly, but barnacles, snails, mussels, seastars, limpets, sea anemones, shore crabs, polychaetes, and macroalgae can be abundant

Predicted Oil Behavior

- Oil is held offshore by waves reflecting off the steep, hard surfaces
- Any oil that is deposited is rapidly removed from exposed faces
- The most resistant oil would remain as a patchy band at or above the high tide line
- Impacts to intertidal communities are expected to be short-term; an exception would be where heavy concentrations of a light refined product came ashore very quickly

Response Considerations

- Cleanup is usually not required
- Access can be difficult and dangerous

EXPOSED, SOLID MAN-MADE STRUCTURES — ESI =1B

Description

- These are solid, man-made structures such as seawalls, groins, revetments, piers, and port facilities
- Many structures are constructed of concrete, wood, or metal
- They are built to protect the shore from erosion by waves, boat wakes, and currents, and thus are exposed to rapid natural removal processes
- Often there is no exposed substrate at low tide, but multiple habitats are indicated if present
- Attached animals and plants are sparse to common

Predicted Oil Behavior

- Oil is held offshore by waves reflecting off the steep, hard surface in exposed settings
- Oil readily adheres to the dry, rough surfaces, but it does not adhere to wet substrates
- The most resistant oil would remain as a patchy band at or above the high tide line

Response Considerations

- Cleanup is usually not required
- High-pressure water spraying may be conducted to remove risk of contamination of people or vessels, or to improve aesthetics

EXPOSED WAVE-CUT PLATFORMS IN BEDROCK — ESI = 2A

Description

- These shores consist of a bedrock shelf or platform of highly variable width and very gentle slope
- The surface of the platform is irregular; tidal pools are common
- The shoreline may be backed by a steep scarp or low bluff
- There may be a perched beach of sand- to boulder-sized sediments at the base of the scarp
- Small accumulations of gravel can be found in the tidal pools and crevices in the platform
- These habitats can support large populations of encrusting animals and plants, with rich tidal pool communities; barnacles, snails, mussels, and macroalgae are often abundant

Predicted Oil Behavior

- Oil will not adhere to the rock platform, but rather be transported across the platform and accumulate along the high tide line
- Persistence of oiled sediments is usually short-term, except in wave shadows or where the oil was deposited high above normal wave activity

Response Considerations

- Cleanup is usually not required
- Where the high tide area is accessible, it may be feasible to remove heavy oil accumulations and oiled debris

EXPOSED SCARPS AND STEEP SLOPES IN CLAY — ESI = 2B

Description

- These habitats generally occur along exposed wetlands and major river tributaries in the marsh where the currents cut a steep bank into the marsh soils
- Scarp heights vary from about 0.3 to 1 m and usually consist of a heavily rooted, peaty soil
- May be fronted by a narrow beach of fine to medium-grained sand and/or shell fragments
- Low biological utilization because of eroding banks
- Typically backed by wetland vegetation

Predicted Oil Behavior

- Oil is not expected to adhere to the wet, impermeable clay surface
- There may be a thin band of oil left at or above the high water line

Response Considerations

- Cleanup is usually not required, because any stranded oil is quickly removed by wave action
- Access may be difficult

FINE- TO MEDIUM-GRAINED SAND BEACHES ESI = 3A

Description

- These beaches are flat to moderately sloping and relatively hard packed
- There can be heavy accumulations of wrack present
- They are utilized by birds and sea turtles for nesting
- Upper beach fauna include ghost crabs and amphipods; lower beach fauna can be moderate, but highly variable

Predicted Oil Behavior

- Light oil accumulations will be deposited as oily swashes or bands along the upper intertidal zone
- Heavy oil accumulations will cover the entire beach surface; oil will be lifted off the lower beach with the rising tide
- Maximum penetration of oil into fine- to medium-grained sand is about 10-15 cm
- Burial of oiled layers by clean sand within the first week after a spill typically will be less than 30 cm along the upper beach face
- Organisms living in the beach sediment may be killed by smothering or lethal oil concentrations in the interstitial water
- Biological impacts include temporary declines in infauna, which can affect shorebird foraging areas

Response Considerations

- These beaches are among the easiest shoreline types to clean
- Cleanup should concentrate on removing oil and oily debris from the upper swash zone once oil has come ashore
- Manual cleanup, rather than road graders and front-end loaders, is advised to minimize the volume of sand removed from the shore and requiring disposal
- All efforts should focus on preventing the mixing of oil deeper into the sediments by vehicular and foot traffic
- Mechanical reworking of lightly oiled sediments from the high tide line to the middle intertidal zone can be effective along beaches

SCARPS AND STEEP SLOPES IN SAND — ESI = 3B

Description

- Occurs where sandy bluffs are undercut by waves or currents and slump
- Some scarps are fronted by narrow beaches, if the erosion rates are moderate and episodic
- Trees growing at the top of these slopes are eventually undercut and the logs can accumulate at the base of the scarp
- Biological utilization by birds and infauna is low

Predicted Oil Behavior

- Any stranded oil will concentrate at the high-water line and may penetrate sandy sediments
- Oil will also adhere to the dry surfaces of any logs that have accumulated at the base of the scarp
- There is little potential for burial except when major slumping of the bluff occurs

Response Considerations

- In many cases, cleanup is not necessary because of the short residence time of the oil
- The need for removal of oiled sediments and debris should be carefully evaluated because of the potential for increased erosion
- Closely supervised manual labor should be used so that the minimal amount of material is removed during cleanup

COARSE-GRAINED SAND BEACHES — ESI = 4

Description

- These beaches are moderate sloping, of variable width, and have soft sediments. These characteristics combine to lower their trafficability
- Generally species density and diversity is lower than on fine-grained sand beaches

Predicted Oil Behavior

- During small spills, oil will be deposited primarily as a band along the high tide line
- Under very heavy accumulations, oil may spread across the entire beach face, though the oil will be lifted off the lower beach with the rising tide
- Penetration of oil into coarse-grained sand can reach 25 cm
- Burial of oiled layers by clean sand can be as rapid as one tidal cycle and to depths of 60 cm or more
- Burial to depths over 1m is possible if the oil comes ashore at the start of a depositional period
- Biological impacts include temporary declines in infaunal populations, which can also affect important shorebird foraging areas

Response Considerations

- Cleanup should concentrate on removing oil and oily debris from the upper swash zone once oil has come ashore

- Manual cleanup, rather than road graders and front-end loaders, is advised to minimize the volume of sand removed from the shore and requiring disposal
- Efforts should focus on preventing mixing of oil deeper into the sediments by vehicular and foot traffic
- Mechanical reworking of lightly oiled sediments from the high tide line to the middle intertidal zone can be effective along beaches

MIXED SAND AND GRAVEL BEACHES ESI = 5

Description

- Because of the mixed sediment sizes, there may be zones of pure sand, pebbles, or cobbles
- There can be large-scale changes in the sediment distribution patterns depending upon season, because of the transport of the sand offshore during storms
- Because of sediment mobility and desiccation, exposed beaches tend to have low densities of attached animals and plants
- Presence of attached algae, mussels, and barnacles indicates beaches that are relatively sheltered, with the more stable substrate supporting a richer biota

Predicted Oil Behavior

- During small spills, oil will be deposited along and above the high-tide swash
- Large spills will spread across the entire intertidal area
- Oil penetration into the beach sediments may be up to 50 cm; however, the sand fraction can be quite mobile, and oil behavior is much like on a sand beach if the sand fraction exceeds about 40 percent
- Burial of oil may be deep at and above the high tide line, where oil tends to persist, particularly where beaches are only intermittently exposed to waves
- In sheltered pockets on the beach, pavements of asphalted sediments can form if there is no removal of heavy oil accumulations because most of the oil remains on the surface

Response Considerations

- Remove heavy accumulations of pooled oil from the upper beach
- All oiled debris should be removed; sediment removal should be limited as much as possible
- Sediment removal should be limited as much as possible
- Low-pressure flushing can be used to float oil away from the sediment for recovery by skimmers or sorbents. High-pressures should be avoided because of potential for transporting contaminated finer sediment (sand) to the lower intertidal or subtidal zones.
- Mechanical reworking of oiled sediments from the high tide zone to the middle intertidal zone can be effective in areas regularly exposed to wave activity. Oiled sediments should not be relocated below the mid-tide zone
- In-place tilling may be used to reach deeply buried oil layers on exposed beaches

GRAVEL BEACHES — ESI = 6A

Description

- Gravel beaches are composed of sediments ranging in size from pebbles to boulders
- They can be very steep, with multiple, wave-built berms forming the upper beach
- Attached biota are usually restricted to the lowest parts of the beach, where the sediments are less mobile
- The presence of attached biota indicates beaches that are relatively sheltered, with the more stable substrate supporting richer biological communities

Predicted Oil Behavior

- Stranded oil is likely penetrate deeply into gravel beaches because of their high permeability
- On exposed beaches, oil can be pushed over the high tide and storm berms, pooling and persisting above the normal zone of wave wash
- Long-term persistence will be controlled by the depth of penetration versus the depth of routine reworking by storm waves
- On sheltered portions of beaches, chronic sheening and formation of asphalt pavements is likely where accumulations are heavy

Response Considerations

- Heavy accumulations of pooled oil should be removed quickly from the upper beach
- All oiled debris should be remove
- Sediment removal should be limited as much as possible
- Low- to high-pressure flushing can be used to lift oil from the sediments for recovery by skimmers or sorbents
- Mechanical reworking of oiled sediments from the high tide zone to the middle intertidal zone can be effective in areas regularly exposed to wave activity (as evidenced by storm berms). Oiled sediments should not be relocated below the mid-tide zone
- In-place tilling may be used to reach deeply buried oil layers on exposed beaches

RIPRAP — ESI = 6B

Description

- Riprap structures are composed of cobble- to boulder-sized blocks of rock, concrete, etc.
- Riprap structures are used as revetments and groins for shoreline protection and breakwaters and jetties around inlets and marinas
- Attached biota are sparse at the upper intertidal zone, but more common in the lower intertidal
- They are common in highly developed waterfront areas

Predicted Oil Behavior

- Deep penetration of oil between the blocks is likely, with oiling of trapped debris
- Oil adheres readily to the rough surfaces of the blocks
- Uncleaned oil can cause chronic leaching until the oil hardens

Response Considerations

- When the oil is fresh and liquid, high-pressure spraying and/or water flooding may be effective if all liberated oil is recovered
- Heavy and weathered oils are more difficult to remove, requiring scraping and/or hot-water spraying
- Removal of oiled debris deep in the crevices will be difficult

EXPOSED TIDAL FLATS — ESI = 7

Description

- Exposed tidal flats are broad, flat intertidal areas composed primarily of sand and minor amounts of shell, gravel, or mud
- The presence of sand indicates that tidal currents and waves are strong enough to mobilize the sediments
- They are usually associated with another shoreline type on the landward side of the flat, though they can occur as separate shoals; they are commonly associated with tidal inlets
- The sediments are water saturated, with only the higher ridges drying out during low tide
- Biological utilization can be very high, with large numbers of infauna, heavy use by birds for roosting and foraging, and use by foraging fish

Predicted Oil Behavior

- Oil does not usually adhere to the surface of exposed tidal flats, but rather moves across the flat and accumulates at the high-tide line
- Deposition of oil on the flat may occur on a falling tide if concentrations are heavy
- Oil does not penetrate water-saturated sediments, but may penetrate the tops of the ridges and coat gravel/shell
- Biological damage may be severe, primarily to infauna, reducing food sources for birds and fish

Response Considerations

- Currents and waves can be very effective in natural removal of the oil
- Cleanup can be done only during low tide, thus there is a narrow window of opportunity
- Use of machinery should be restricted to prevent mixing of oil into the sediments
- Manual removal methods are preferred, though worker access may be difficult

SHELTERED ROCKY SHORES — ESI = 8A

Description

- These shores are characterized by a rocky substrate that can vary widely in permeability. Of particular concern are rocky shores that have a semi-permeable veneer of angular rubble overlying the bedrock
- The wider shores may have some surface sediments, but the bedrock is the dominant substrate type
- Species density and diversity vary greatly, but attached biota may be present at high densities at lower tidal elevations

Predicted Oil Behavior

- Oil will adhere readily to the rough rocky surface, forming a distinct oil band along the high tide line
- Even on wide ledges, the lower intertidal zone usually stays wet (particularly when algae covered), preventing oil from adhering to the rock surface
- Heavy and weathered oils can cover the upper zone with little impacts to the rich biological communities of the lower zone
- Where the rubble is loosely packed, oil will penetrate deeply, causing long-term contamination of the subsurface sediments

Response Considerations

- Low- to high-pressure spraying at ambient water temperatures is most effective when the oil is fresh
- Extreme care must be taken not to spray in the biologically rich lower intertidal zone or when the tidal level reaches that zone
- Do not cut oiled, attached algae; use sorbents to recover oil as it is remobilized by tidal action

SHELTERED, SOLID MAN-MADE STRUCTURES — ESI = 8B

Description

- These are structures such as seawalls, groins, revetments, piers, and port facilities, constructed of concrete, wood, or metal
- Most of the structures are designed to protect a single lot, thus their composition, design, and condition are highly variable
- Often there is no exposed shore at low tide
- There can be dense attachments of animal and plant life

Predicted Oil Behavior

- Oil will adhere readily to rough surfaces, particularly along the high tide line, forming a distinct oil band
- The lower intertidal zone usually stays wet (particularly if algae covered), preventing oil from adhering to the surface

Response Considerations

- Cleanup of seawalls is usually conducted for aesthetic reasons or to prevent leaching of oil
- Low- to high-pressure spraying at ambient water temperatures is most effective when the oil is fresh

SHELTERED TIDAL FLATS — ESI = 9A

Description

- Sheltered tidal flats are composed of mud with minor amounts of sand and shell
- They are present in calm-water habitats, sheltered from major wave activity, and frequently backed by marshes
- The sediments are very soft and cannot support even light foot traffic in many areas
- Large concentrations of bivalves, worms, and other invertebrates are in the sediments
- They are heavily utilized by birds for feeding

Predicted Oil Behavior

- Oil does not usually adhere to the surface of sheltered tidal flats, but rather moves across the flat and accumulates at the high-tide line
- Oil can strand on the flat during a falling tide if concentrations are heavy
- Oil will not penetrate the water-saturated sediments, but could penetrate burrows or other crevices in muddy sediments
- In areas of high suspended sediments, sorption of oil can result in deposition of contaminated sediments on the flats
- Biological impacts may be severe

Response Considerations

- These are high-priority areas because cleanup options are limited
- Cleanup of the flat surface is very difficult because of the soft substrate; many methods may be restricted
- Low-pressure flushing and deployment of sorbents from shallow-draft boats may be attempted

SHELTERED, VEGETATED LOW BANKS — ESI = 9B

Description

- These habitats are either low banks with grasses or trees and tree roots exposed to the water
- They are flooded occasionally by high water

Predicted Oil Behavior

- During low-water conditions there is little impact, with the oil coating a narrow band of sediment at the water level
- During high-water conditions, the oil will cover and coat the grasses and base of trees
- May cause loss of the grasses, but the trees should survive unless oil penetrates and persists in the substrate

Response Considerations

- Low-pressure flushing of oiled areas is effective in removing moderate to heavy accumulations of oil from along the banks
- Sorbent and containment boom should be placed on the water side of the cleanup operations to contain and collect oil outflow
- Low- to high-pressure flushing can be used to remove oil from tree roots and trunks, if deemed necessary in high-use areas

SALT-AND BRACKISH-WATER MARSHES ESI = 10A

Description

- These are intertidal wetlands that consist of emergent, herbaceous vegetation. Depending on location and inter-annual variations in rainfall and runoff, associated vegetation may include species tolerant of or adapted to salt, brackish, or tidal freshwater conditions
- The marsh width may vary widely, from a narrow fringe to extensive areas
- Sediments are composed of organic-rich mud except on the margins of islands or along rivers where sand is abundant
- Exposed areas are located along bays with wide fetches and along heavily trafficked waterways
- Sheltered areas are not exposed to significant wave or boat wake activity
- Resident flora and fauna are abundant with numerous species with high utilization by birds, fish, and shellfish

Predicted Oil Behavior

- Oil adheres readily to the vegetation of most species
- The band of coating will vary widely, depending upon the water level at the time oil slicks are in the vegetation; there may be multiple bands
- Large slicks will persist through multiple tidal cycles and coat the entire stem from the high tide line to the base
- Heavy oil coating will be restricted to the outer fringe of thick vegetation, although lighter oils can penetrate deeper, to the limit of tidal influence
- Medium to heavy oils do not readily adhere to or penetrate the fine sediments, but can pool on the surface or in burrows
- Light oils can penetrate the top few centimeters of sediment; under some circumstances oil can penetrate burrows and cracks up to 1 m

Response Considerations

- Under light oiling, the best practice is natural recovery
- Natural removal processes and rates should be evaluated prior to conducting cleanup
- Heavily pooled oil can be removed by vacuum, sorbents, or low-pressure flushing
- Cleanup activities should be carefully supervised to avoid vegetation damage
- Any cleanup activity must not mix the oil deeper into the sediments; trampling of the roots must be minimized

- Aggressive cleanup methods should only be considered when other resources present (migratory birds, listed species) are at great risk from leaving the oiled vegetation in place

FRESHWATER MARSHES — ESI = 10B

Description

- These are grassy wetlands composed of emergent herbaceous vegetation
- They occur upstream of brackish vegetation in the upper estuary and along creeks and rivers
- Those along major channels are exposed to strong currents and boat wakes; smaller channels tend to be sheltered
- Resident flora and fauna are abundant

Predicted Oil Behavior

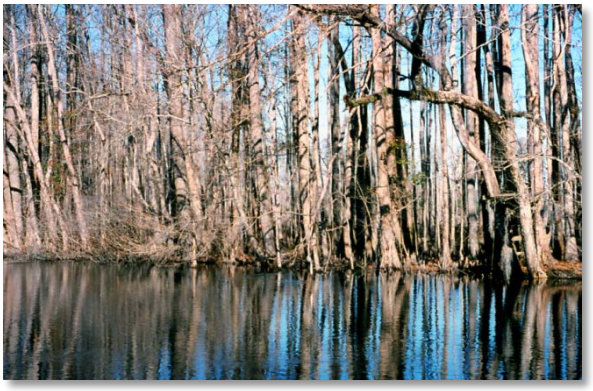
- Oil adheres readily to the vegetation
- The band of coating will vary widely, depending upon the water level at the time oil slicks are in the vegetation; there may be multiple bands
- Most of the time, there will be a narrow band because of the small changes in water levels; the band can be very large during high-water events
- Heavy oil coating will be restricted to the outer fringe of thick vegetation, although lighter oils can penetrate deeper

Response Considerations

- Under light oiling, the best practice is natural recovery
- Natural removal processes and rates should be evaluated prior to conducting cleanup
- Heavy accumulations of pooled oil can be removed by vacuum, sorbents, or low-pressure flushing
- Cleanup activities should be carefully supervised to avoid vegetation damage
- Any cleanup activity must not mix the oil deeper into the sediments. Trampling of the roots must be minimized
- Aggressive cleanup methods should be considered only when other resources present (listed species, nesting birds) are at great risk from leaving the oiled vegetation in place

SWAMPS — ESI = 10C

Description



- Swamps consist of shrubs and hardwood forested wetlands, essentially flooded forests Vegetation is taller, on average, than 6 m
- The sediment tends to be silty clay with large amounts of organic debris
- They are seasonally flooded, though there are many low, permanently flooded areas
- Resident flora and fauna are abundant with numerous species

Predicted Oil Behavior

- Oil behavior depends on whether the swamp is flooded or not

- During floods, most of the oil passes through the forest, coating the vegetation at the waterline, which changes levels throughout the flood event
- Oiled woody vegetation is less sensitive than grasses to oil coating
- Some oil can be trapped and pooled on the swamp flood plain as water levels drop
- Penetration into the floodplain soils is usually limited because of high water, saturated soils, muddy composition, surface organic debris, and vegetation cover
- Large amounts of oily debris can remain
- During dry periods, terrestrial spills flow downhill and accumulate in depressions or reach waterbodies

Response Considerations

- Under light oiling, the best practice is to let the area recover naturally
- Heavy accumulations of pooled oil can be removed by vacuum, sorbents, or low-pressure flushing
- Under stagnant water conditions, herding of oil with water spray may be needed to push and thicken oil to collection areas
- Oily debris can be removed where there is access
- Any cleanup activity must not mix the oil deeper into the sediments

MANGROVES (SCRUB-SHRUB WETLANDS) ESI = 10D

Description

- Roots and trunks are typically intertidal; the lower leaves are flooded at high tide
- The width of the forest can vary from one tree, to many kilometers
- The substrate types can include mud, sand, leaf letter, or peat, often as a veneer over bedrock
- Wrack accumulations can be very heavy
- They are highly productive, serve as nursery habitat, and support a great diversity of animal and plant species

Predicted Oil Behavior

- Oil can wash through mangroves if the oil comes ashore at high tide
- If there is a berm or shoreline present, oil tends to concentrate and penetrate into the sediments or accumulated wrack/litter
- Heavy and emulsified oil can be trapped in thickets of mangrove prop roots or dense young trees
- Oil readily adheres to prop roots, tree trunks, and pneumatophores
- Re-oiling from resuspended or released oil residues may cause additional injury over time
- Oiled trees may start to show evidence of effects (leaf yellowing) days to weeks after oiling; tree mortality may take months, especially for heavy oils

Response Considerations

- Oiled wrack can be removed once the threat of oiling has passed. Wrack can actually protect the trees from direct oil contact
- Sorbent boom can be placed in front of oiled forests to recover released oil
- In most cases, no other cleanup activities are recommended
- Where thick oil accumulations are not being naturally removed, low-pressure flushing or vacuum may be attempted at the outer fringe

- No attempt should be made to clean interior mangroves, except where access to the oil is possible from terrestrial areas
- It is extremely important to prevent disturbance of soft substrates by foot traffic; thus most activities should be conducted from boats

SHORELINE OILING SUMMARY (SOS) FORM EXPLANATIONS

Calibration IS VERY IMPORTANT! Do a calibration exercise to make sure that all teams are consistently using the same terms and estimations.

Units: Use of metric units is preferred. However, if you must use English units, be consistent and note which are used (feet, inches).

Tide Height: Circle the tidal elevation during the survey, and if the tide was rising or falling during the survey.

Segment/Survey Length: Always record both segment and survey lengths on the first survey, especially where the team creates the segments in the field. On repeat surveys, always enter in the Survey Length, especially if only part of the segment is surveyed.

Start/End GPS: The preferred format for latitude and longitude is decimal degrees, but be consistent among teams. Record the datum if different than WGS84.

SURFACE OILING CONDITIONS

Zone ID: Use a different ID for each oil occurrence, e.g., two distinct bands of oil at mid-tide and high-tide levels, or alongshore where the oil distribution changes from 10 % to 50%. Describe each oil occurrence on a separate line.

Tidal Zone: Use the codes to indicate the location of the oil being described, as in the lower (LI), mid (MI), or upper (UI) intertidal zone, or in the supra (SU) tidal zone (above the normal high tide level).

Distribution: Enter the estimated percent of oil on the surface (preferred), or codes for the following intervals:

C	Continuous	91-100% cover
B	Broken	51-90%
P	Patchy	11-50%
S	Sporadic	<1-10%
T	Trace	<1%

Surface Oiling Descriptors - Thickness: Use the following codes:

TO	Thick Oil (fresh oil or mousse > 1 cm thick)
CV	Cover (oil or mousse from >0.1 cm to <1 cm on any surface)
CT	Coat (visible oil <0.1 cm, which can be scraped off with fingernail)
ST	Stain (visible oil, which cannot be scraped off with fingernail)
FL	Film (transparent or iridescent sheen or oily film)

Surface Oiling Descriptors - Type

FR	Fresh Oil (unweathered, liquid oil)
MS	Mousse (emulsified oil occurring over broad areas)
TB	Tar Balls (discrete accumulations of oil <10 cm in diameter)
PT	Patties (discrete accumulations of oil >10 cm in diameter)
TC	Tar (highly weathered oil, of tarry, nearly solid consistency)
SR	Surface Oil Residue (non-cohesive, oiled surface sediments)
AP	Asphalt Pavements (cohesive, heavily oiled surface sediments)
No	No oil (no evidence of any type of oil)

SUBSURFACE OILING CONDITIONS

Oiled Interval: Measure the depths from the sediment surface to top/bottom of subsurface oiled layer. Enter multiple oil layers on separate lines.

Subsurface Oiling Descriptors: Use the following codes:

OP	Oil-Filled Pores (pore spaces are completely filled with oil)
PP	Partially Filled Pores (the oil does not flow out of the sediments when disturbed)
OR	Oil Residue (sediments are visibly oiled with black/brown coat or cover on the clasts, but little or no accumulation of oil within the pore spaces)
OF	Oil Film (sediments are lightly oiled with an oil film, or stain on the clasts)
TR	Trace (discontinuous film or spots of oil, or an odor or tackiness)

Sheen Color: Describe sheen on the water table as brown (B), rainbow (R), silver (S), or none (N)

TAR BALL SHORELINE OILING SUMMARY FORM EXPLANATIONS

Calibration IS VERY IMPORTANT! Do a calibration exercise to make sure that all teams are consistently using the same terminology and estimations.

Units: Use of metric units is preferred. However, if you must use English units, be consistent and note which are used (feet, inches).

Tide Height: Circle the tidal elevation during the survey, and if the tide was rising or falling during the survey.

Segment/Surveyed Length: Always record both segment and survey lengths on the first survey, especially where the SCAT team creates the segments in the field. On repeat surveys, always enter in the Length Surveyed, especially if only part of the segment is surveyed.

Start/End GPS: The preferred format for latitude and longitude is decimal degrees, but be consistent among teams. Record the datum if different than WGS84.

Shoreline Type: Indicate the primary and secondary shoreline types (use the ESI number codes) for the entire segment or sub-segment being surveyed.

TAR BALL DESCRIPTION
This section is divided into "Zones." Use a different Zone to describe changes in: presence/absence, size, or concentration of tar balls, or different shoreline types.

Start/End WP: Record the way point (WP) for the start and end of each Area.

Shoreline Type: Record the shoreline type(s) present in each oiled zone using the ESI code.

Tar Balls Observed on Shoreline? It is important to indicate if no tar balls are observed.

Tar Balls Observed on Water? It is important to indicate if tar balls are still coming ashore or mobile.

Oiled Debris Observed? If yes, describe type, location, and degree oiling for oiled debris under Comments. Use the following descriptors for type:

Wrack	unattached vegetation that can be important feeding areas for shorebirds
Logs	large pieces of wood that cannot be readily removed by hand
Trash	man-made materials (e.g., plastic, glass, paper) that can be removed by hand
Sorbents	sorbent pads, rolls, boom, etc. used during the spill response
Peat	degraded organic material that has been eroded; includes coffee grounds

Tidal Zone: Check off the location of the tar balls being described, as in the lower (LI), mid (MI), upper (UI), or supra (SU) tidal zone (above the normal high tide level).

Length and Width: Enter the dimensions where tar balls of uniform average size and density are observed. If no tar balls are observed, enter the dimensions of the area surveyed.

Average Number of Tar Balls within Area: Enter the estimate of the number of tar balls in the surveyed area. Options include:

Total number - use where so few tar balls are present that they can be readily counted

Concentration - enter as an average, range, or max per unit area (e.g., 1-2/yd^2, 3-5 max)

Average Size of Tar Balls: Visually estimate the most common or frequent size of tar balls in the surveyed area. Enter a range if tar ball sizes are not uniform. Indicate units by circling.

Tar Balls Collected? Provide details in the Comments Section. Indicate if all or only part of the observed tar balls were collected.

WETLAND OILING SUMMARY FORM _____ Page _____ of ___

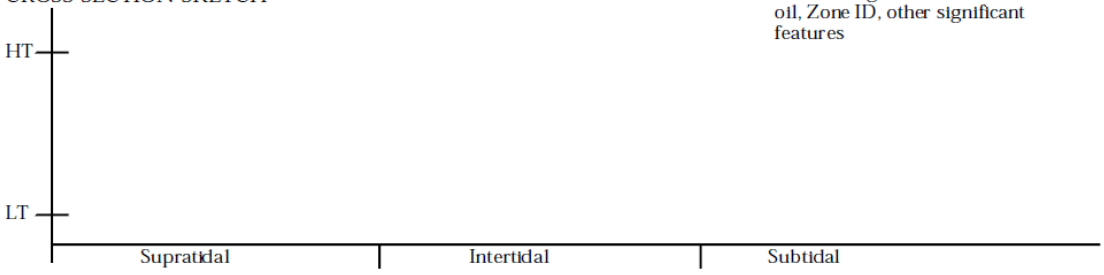
CROSS-SECTION SKETCH

SHOW: high tide, low tide, buried oil, Zone ID, other significant features



WETLAND OILING SUMMARY FORM EXPLANATIONS

Calibration is VERY IMPORTANT! Make sure that all teams are consistently using the same terminology and estimations.

Units: Use metric (m, cm) units. Record Latitude and Longitude in decimal degrees. Set datum on GPS units to WGS84.

Tide Height: Circle the tidal elevation during the survey, and if the tide was rising or falling during the survey.

Segment/Survey Length: Always record both segment and survey lengths on the first survey, especially where the SCAT team creates the segments in the field. On repeat surveys, always enter in the Survey Length, especially if only part of the segment is surveyed.

Start/End GPS: Record the GPS Way Point and the Lat/Long of the start and end of the survey.

SURFACE OILING CONDITIONS

Zone ID: Identify Zones sequentially by letter (A to Z) along a Segment and describe each oil occurrence on a separate line. Indicate oiling on the vegetation by adding a V to the Zone ID (e.g. AV, If different oiling conditions exist along the same length of beach (e.g., two distinct bands of oil at mid-tide and high-tide levels) identify them by their letter code followed by a number (e.g. A1 & A2). Change to a new letter (zone) when alongshore oil distribution changes (e.g. from 10 % to 50%).

Zone ID: Use a different ID for each different oil occurrence and differentiate between oil on the substrate (S) and vegetation (V). Describe each different occurrence on a separate line.

Shoreline Type: Record the shoreline type(s) present in each oiled zone using the ESI code.

Way Points: Record GPS Way Points (WP) for start and end of each zone.

Tidal Zone: Use the codes to indicate the location of the oil being described, as in the lower (LI), mid (MI), or upper (UI) intertidal zone, or in the supra (SU) tidal zone (above the normal high tide level).

Distribution: Enter the estimated percent of oil on the surface (preferred), or codes for the following intervals:

C	Continuous	91-100%
B	Broken	51-90%
P	Patchy	11-50%
S	Sporadic	<1-10%
T	Trace	<1%

Surface Oiling Descriptors - Thickness:

TO	Thick Oil (fresh oil or mousse > 1 cm thick)
CV	Cover (oil or mousse from >0.1 cm to <1 cm on any surface)
CT	Coat (visible oil <0.1 cm, which can be scraped off with fingernail)
ST	Stain (visible oil, which cannot be scraped off with fingernail)
FL	Film (transparent or iridescent sheen or oily film)

Surface Oiling Descriptors – Type:

FR	Fresh Oil (unweathered, liquid oil)
MS	Mousse (emulsified oil occurring over broad areas)
TB	Tar Balls (discrete accumulations of oil <10 cm in diameter)
TC	Tar (highly weathered oil, of tarry, nearly solid consistency)
SR	Surface Oil Residue (non-cohesive, oiled surface sediments)
AP	Asphalt Pavements (cohesive, heavily oiled surface sediments)
No	No oil (no evidence of any oil)

Oil on Plants: Indicate the width of the band of oiling on the plants in the Zone information**.** Describe what part of the vegetation is oiled in the Comments. Terms will vary depending on vegetation type (e.g., stems for marshes, trunks for trees).

Cross-Section Sketch: Draw entire intertidal and supra-tidal zone, showing the oil relative to normal high tide (important to determine re-mobilization and potential for natural removal).

RIVER BANK SHORELINE OILING SUMMARY FORM EXPLANATIONS

Calibration IS VERY IMPORTANT! Do a calibration exercise to make sure that all teams are consistently using the same terms and estimations.

Units: Use of metric units is preferred. However, if you must use English units, be consistent.

Water Level: Circle the water level during the survey, and if the water level was rising or falling during the survey.

Segment/Survey Length: Always record both segment and survey lengths on the first survey, especially where the team creates the segments in the field. On repeat surveys, always enter in the Survey Length, especially if only part of the segment is surveyed.

Start/End GPS: The preferred format for latitude and longitude is decimal degrees, but be consistent among teams. Record the datum if different than WGS84.

SURFACE OILING CONDITIONS

Zone ID: Use a different ID for each oil occurrence, e.g., two distinct bands of oil on the upper bank and in overbank areas, or along the bank where the oil distribution changes from 10 % to 50%. Describe each oil zone on a separate line.

River Bank Zone: Use the codes to indicate the location of the oil being described, as in the midstream (MS), lower bank (LB), upper bank (UB), or overbank (OB) zone above the normal water level.

Distribution: Enter the percent of oil on the surface (preferred), or codes for the following intervals:

C	Continuous	91-100% cover
B	Broken	51-90%
P	Patchy	11-50%
S	Sporadic	<1-10%
T	Trace	<1%

Surface Oiling Descriptors - Thickness: Use the following codes:

TO	Thick Oil (fresh oil or mousse > 1 cm thick)
CV	Cover (oil or mousse from >0.1 cm to <1 cm on any surface)
CT	Coat (visible oil <0.1 cm, which can be scraped off with fingernail)
ST	Stain (visible oil, which cannot be scraped off with fingernail)
FL	Film (transparent or iridescent sheen or oily film)

Surface Oiling Descriptors - Type

FR	Fresh Oil (unweathered, liquid oil)
MS	Mousse (emulsified oil occurring over broad areas)
TB	Tar Balls (discrete accumulations of oil <10 cm in diameter)
PT	Patties (discrete accumulations of oil >10 cm in diameter)
TC	Tar (highly weathered oil, of tarry, nearly solid consistency)
SR	Surface Oil Residue (non-cohesive, oiled surface sediments)
AP	Asphalt Pavements (cohesive, heavily oiled surface sediments)
No	No oil (no evidence of any type of oil)

SUBSURFACE OILING CONDITIONS

Oiled Interval: Measure the depths from the sediment surface to top/bottom of subsurface oiled layer. Enter multiple oil layers on separate lines.

Subsurface Oiling Descriptors: Use the following codes:

OP	Oil-Filled Pores (pore spaces are completely filled with oil)
PP	Partially Filled Pores (the oil does not flow out of the sediments when disturbed)
OR	Oil Residue (sediments are visibly oiled with black/brown coat or cover on the clasts, but little or no accumulation of oil within the pore spaces)
OF	Oil Film (sediments are lightly oiled with an oil film, or stain on the clasts)
TR	Trace (discontinuous film or spots of oil, or an odor or tackiness)

Sheen Color: Describe sheen on the water table as brown (B), rainbow (R), silver (S), or none (N)

STREAM BANK SHORELINE OILING SUMMARY FORM EXPLANATIONS

Calibration IS VERY IMPORTANT! Do a calibration exercise to make sure that all teams are consistently using the same terms and estimations.

Units: Use of metric units is preferred. However, if you must use English units, be consistent and note which are used (feet, inches).

Water Level: Circle the water level during the survey, and if the water level was rising or falling during the survey.

Segment/Survey Length: Always record both segment and survey lengths on the first survey, especially where the team creates the segments in the field. On repeat surveys, always enter in the Survey Length, especially if only part of the segment is surveyed.

Start/End GPS: The preferred format for latitude and longitude is decimal degrees, but be consistent among teams. Record the datum if different than WGS84.

SURFACE OILING CONDITIONS: Record the following for each bank of the stream, left and right, facing downstream

Zone ID: Use a different ID for each oil occurrence, e.g., two distinct bands of oil on the upper bank and in overbank areas, or along the bank where the oil distribution changes from 10 % to 50%. Describe each oil occurrence on a separate line.

Stream Bank Zone: Use the codes to indicate the location of the oil being described, as in the midstream (MS), lower bank (LB), upper bank (UB), or overbank (OB) zone above the normal water level.

Distribution: Enter the estimated percent of oil on the surface (preferred), or codes for the following intervals:

C	Continuous	91-100% cover
B	Broken	51-90%
P	Patchy	11-50%
S	Sporadic	<1-10%
T	Trace	<1%

Surface Oiling Descriptors - Thickness: Use the following codes:

TO	Thick Oil (fresh oil or mousse > 1 cm thick)
CV	Cover (oil or mousse from >0.1 cm to <1 cm on any surface)
CT	Coat (visible oil <0.1 cm, which can be scraped off with fingernail)
ST	Stain (visible oil, which cannot be scraped off with fingernail)
FL	Film (transparent or iridescent sheen or oily film)

Surface Oiling Descriptors - Type

FR	Fresh Oil (unweathered, liquid oil)
MS	Mousse (emulsified oil occurring over broad areas)
TB	Tar Balls (discrete accumulations of oil <10 cm in diameter)
PT	Patties (discrete accumulations of oil >10 cm in diameter)
TC	Tar (highly weathered oil, of tarry, nearly solid consistency)
SR	Surface Oil Residue (non-cohesive, oiled surface sediments)
AP	Asphalt Pavements (cohesive, heavily oiled surface sediments)
No	No oil (no evidence of any type of oil)

SUBSURFACE OILING CONDITIONS

Oiled Interval: Measure the depths from the sediment surface to top/bottom of subsurface oiled layer. Enter multiple oil layers on separate lines.

Subsurface Oiling Descriptors: Use the following codes:

OP	Oil-Filled Pores (pore spaces are completely filled with oil)
PP	Partially Filled Pores (the oil does not flow out of the sediments when disturbed)
OR	Oil Residue (sediments are visibly oiled with black/brown coat or cover on the clasts, but little or no accumulation of oil within the pore spaces)
OF	Oil Film (sediments are lightly oiled with an oil film, or stain on the clasts)
TR	Trace (discontinuous film or spots of oil, or an odor or tackiness)

Sheen Color: Describe sheen on the water table as brown (B), rainbow (R), silver (S), or none (N)

Field Observer Form for Quick Shoreline Assessment

1.	Shoreline Area Name:	Division	Zone	Date: (dd/month/year)	Time:
Segment ID or location description:			Tidal Conditions (e.g.: high, falling)		
GPS Coordinates (if available)			Surveyed by: ____Foot ____Boat ____Vehicle ____Aircraft

Appendix E: A Primer on Drawing Field Sketches

The field sketch is an important component of the shoreline assessment process for two principal reasons: (1) it provides a focused picture of the oil distribution within the entire segment, or sub-segment, on a single piece of paper (or image); and (2) it adds discipline to the field observation process, because it forces the person doing the sketch to make detailed mental notes of all the relevant features.

Step 1

Once you arrive at the segment, imagine yourself held aloft 150 feet by a balloon as you quickly walk around the entire segment. This will give you a mental overview of the spatial distribution of all the relevant features in the segment that should be included in the sketch.

Step 2

Determine the dimensions of the segment and dig trenches to look for subsurface oil. Divide the duties among Team Members (e.g., one to sketch, one or two to pace or tape distances). Pace (or tape) the length and width of the intertidal zone and the size of some of the more conspicuous features, such as groins or seawall segments. Using a pencil, lightly sketch these measurements on the field sheet in Figure E-1 below. Orient the longest dimension along the long axis of the paper. Add scale and north arrow (use English or metric units, as dictated by the situation).

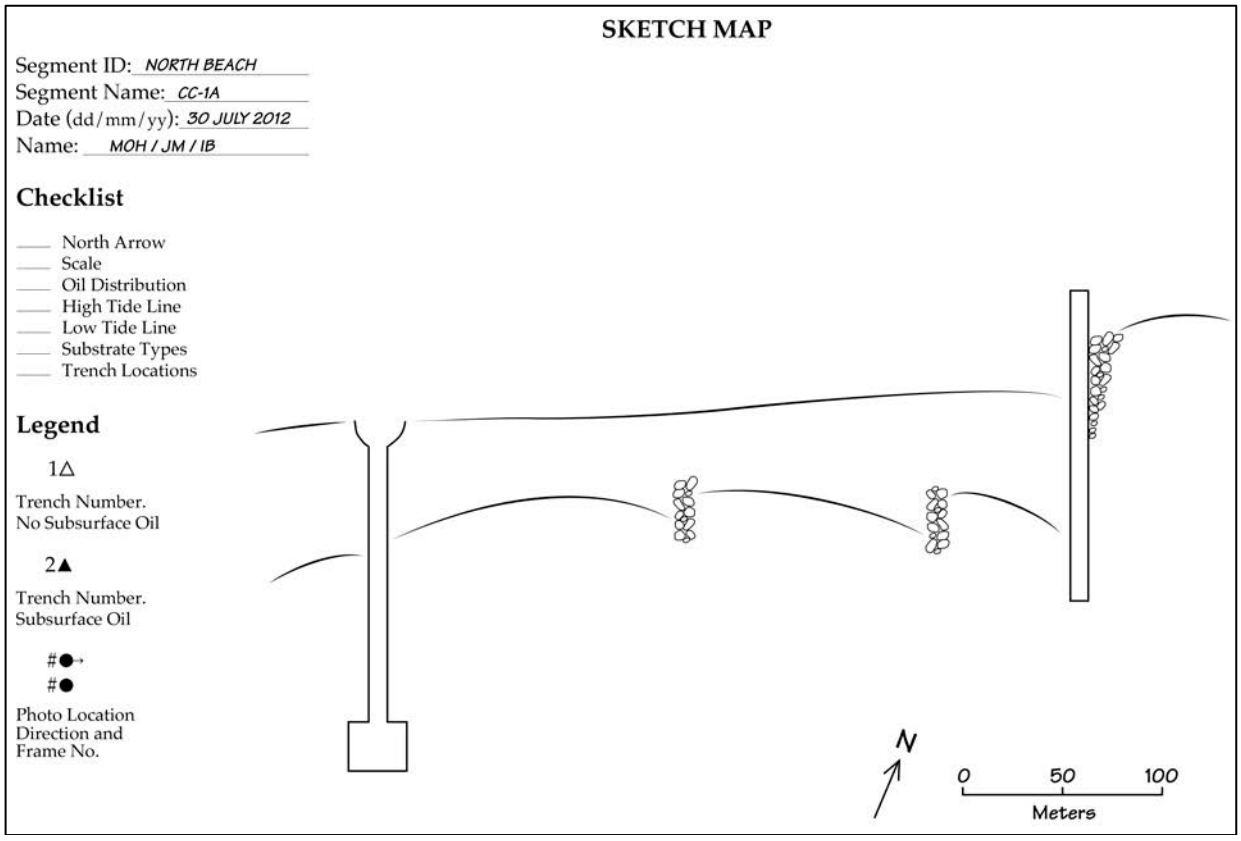

Figure E-1. Example of field sketch map dimensions and scale.

Step 3

Lightly sketch in the outline of the intertidal zone or habitat being surveyed. Show in final form (i.e., heavy pencil marks) the areal distribution of the oil, using a hatched pattern. The oil distribution should be the most conspicuous feature on the sketch, as shown in Figure E-2.

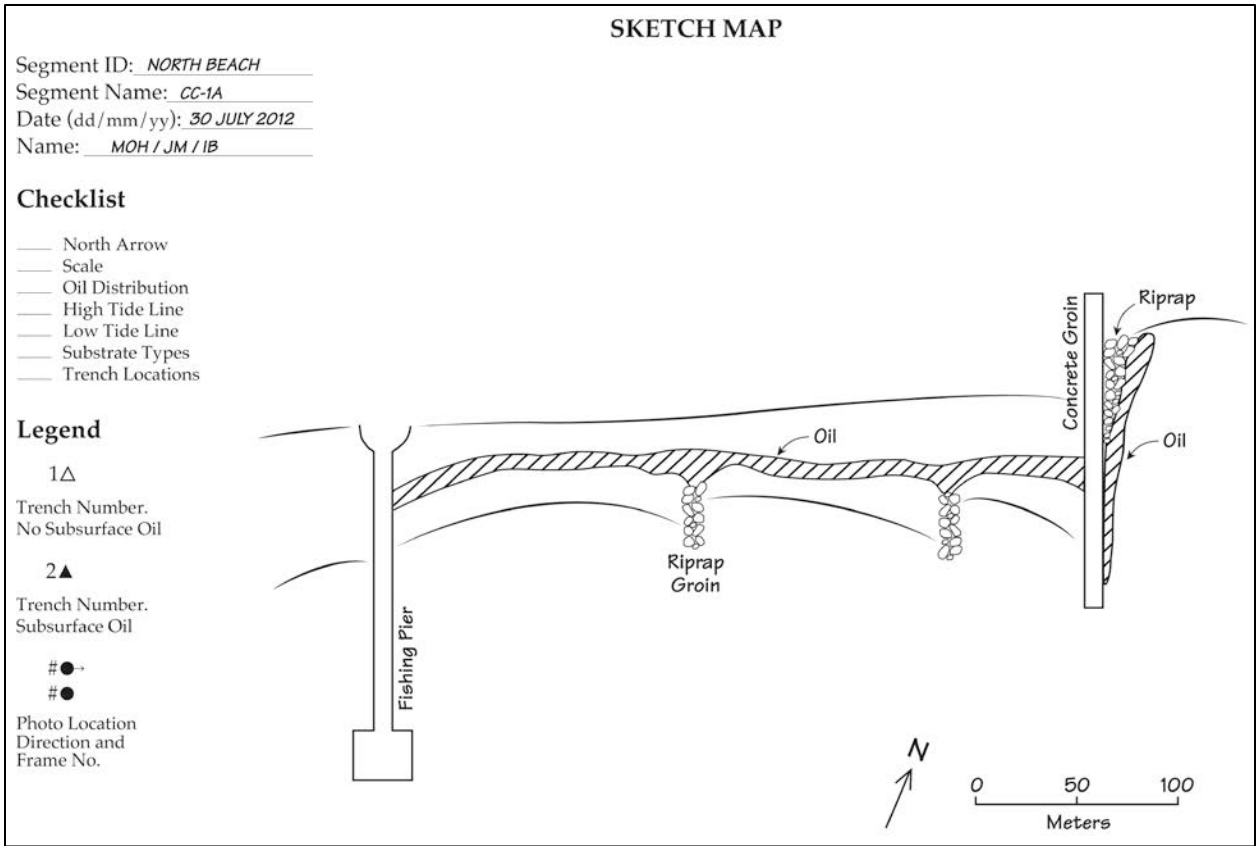

Figure E-2. Example of a field sketch map with outline of surveyed area.

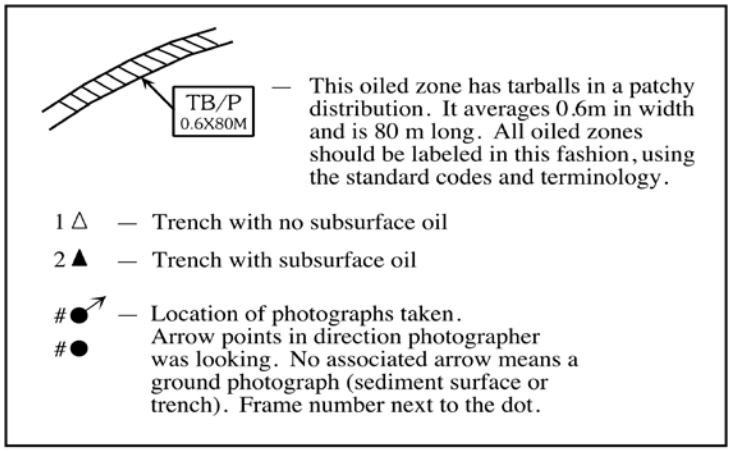
Step 4

Identify critical elements of the sketch, using the following symbology:



Step 5

Fill in the rest of the details of the sketch, showing highlights of the morphology (e.g., beach berms, tidal channels); conspicuous features, such as fences, large logs, and seawalls that would help identify the site; zones of vegetation; and access points, such as roads and parking areas.

Step 6

(Optional) Where appropriate, draw a topographic cross-chapter of the intertidal zone, showing significant topographic breaks (e.g., beach berm crests) and oiled zones.

Step 7

Make sure that the form is completely filled in with site location, date and time of survey, and names of survey Team Members. Review the checklist on the left side of form.

Figure E-3 is an example of a completed beach sketch.

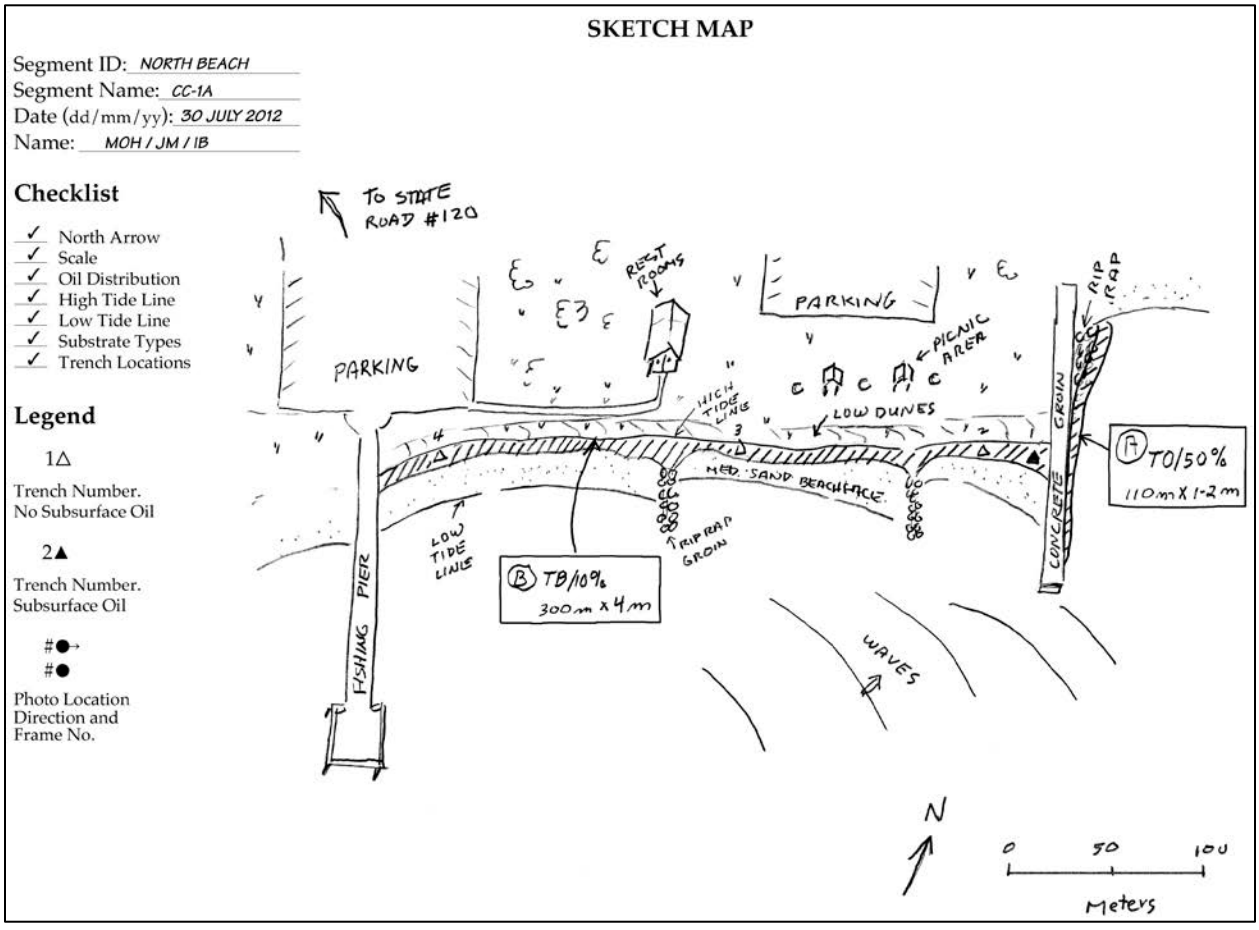


Figure E-3. Example of a completed beach sketch.

Appendix F: Example SCAT Field Safety Plan

1. Intent

The intent of this Field Safety Plan is to establish a structured process and disciplined approach to the mitigation of health, safety and environmental risks associated with our operations and activities and to share our learning with the Incident Management Team. This safety plan applies to the Houma Shoreline Cleanup Assessment Technique (SCAT) Team.

2. Communications

2.1. Daily Pre-Mission Safety Meetings will be conducted at site with each team. Sample Job Hazard Analyses are located at the end of this document. Specific topics to include:

- Lessons learned from the prior day's mission
- Current weather
- PPE requirements
- Food and Water
- Communications
  - check comms on LWIN radio (GCI-5) or Green Sticker depending where the team is surveying
  - confirm handheld VHF radio on same channel as boat/aircraft pilot
- Review boat/flight plan with boat or aircraft pilot
- Training requirements
- Check with each Team Member if they have safety concerns that need to be mitigated before leaving

2.2. Each team is equipped with a

- Cell Phone and/or Motorola XTS 2500i handheld – for contact between field team and base
- Uniden VHF handheld radio – for contact between field team and boat/aircraft pilot
- Satellite Telephone – backup in case cell and Motorola handheld fail (dial country code 001 + 10 digit phone number)
-

2.3 The Field Team Lead shall call in when departing or arriving a location via boat, helicopter or vehicle. The SCAT desk phone numbers are: xxx-xxx-xxxx.

2.4. SCAT Team Logistics at the Command Post must update the SCAT Status Board upon notification from any SCAT Field Team.

2.5. Each SCAT Field Team will be provided with a copy of this safety plan, the medical plan, and at least one set of area maps.

3. Vehicle Safety

3.1. Pre-Trip Plan (Maps, directions)
3.2. Seat Belt use is mandatory
3.3. Observe all posted speed limits
3.4. No use of cell phones by driver unless car is stopped and in Park position

4. Accidents – Injuries – Spills – Near Misses

4.1. Any accidents, injuries, spills or near misses must be reported to the SCAT Field Coordinators as soon as possible. The SCAT Coordinator will report the incident to the Safety Officer within two hours of the incident by calling xxx-xxx-xxxx**.**

4.2. Reporting of the incident or near miss on the "Preliminary HSSE Incident Report –short form" will be initiated by the SCAT Field Coordinators with the assistance of the injured person or SCAT Field Team. It is the responsibility of the SCAT Field Coordinators to notify the appropriate personnel within the Incident Management Team.

4.3. Any accidents, spills or near-misses will be discussed at the daily SCAT Field Report meeting to identify appropriate mitigation, ensure reporting is completed, and to share lessons learned.

5. Training

5.1. Any member of a SCAT Field Team is required to have the following Safety Training.

- Level I and II BP Safety Induction
- 40 hour Hazwoper Certification – or accompanied by someone with 40 hour Hazwoper
- PHI Helicopter Pre-Flight Safety Briefing
- Vessel/Air-boat Safety Briefing
- Inclement Weather Training and Heat Stress training
- ATV Training

5.2. The Team Lead must have current 40 hour Hazwoper training. The preferred number of people on a SCAT team is three. A minimum of two people is required.

6. Personal Protective Equipment

6.1. Each SCAT Field Team Member is expected to don the following Personal Protection Equipment while on a boat or in a helicopter.

- First Aid Kit
- Hearing Protection – **Double Hearing Protection for Airboats**
- Personal Floatation Devices
  - USCG Type 1 floatation devices for use in open ocean offshore situations and within 50/50 weather rule.
  - USCG Type 2 floatation device for use in calm inland waters with good chance of rapid rescue response
  - USCG Type 3 floatation device also for use in calm inland waters with good chance of rapid rescue response
- Eye Protection on boats (Sunglasses or Safety Glasses)
- Hand Protection (nitrile) if handling oil – (as needed)
- Mosquito Repellant (as needed)
- Sunscreen and hat (as needed)
- Waterproof boots (as needed)

- If working in cleanup operational area, abide by site Personal Protection Equipment requirements (i.e. hard hats, chicken feet etc.)

7. Weather

7.1. SCAT Logistics and Safety personnel will monitor the Daily regional and local weather
7.2. SCAT Field Teams will be given weather updates when they call in to the Command Post
7.3. If the SCAT Logistics and Safety personnel identify a serious weather risk, the affected SCAT Field Teams will be notified by cell phone and/or VHF radio as possible
7.4. On days where there is a threat of thunderstorms or rain, use lightning detectors that are in place on all lead crew boats.

8. Emergency Notification

8.1. On Water Emergencies -Coast Guard – VHF GCI-5
8.2. Land Emergencies, Fire and Ambulance – phone 911
8.3. Water Patrol: xxx-xxx-xxxx

9. Leadership

9.1. While on an aircraft, boat or airboat, SCAT Team Members will follow pilot/skipper instructions at all times. The SCAT Team Leader is responsible for the following:
- Bring Safety Plan and Medical Plan on each mission
- Conduct Pre-Mission Safety Meeting
- Report all accidents, spills or near-misses to SCAT Coordinator
- Ensure all Team Members can operate communications
- Ensure all Team Members know Safety Training and Personal Protection Equipment requirements
- If any Team Member believes there are safety risks that must be mitigated prior to starting the mission, resolve issue or call off mission.

10. Reviewing and Updating

Changing conditions may occur which wil require review and revision of the Field Safety Plan. Triggers for review of the plan may include grounding of much larger quanities of oil, stranding of fresher oil (more volatiles), proximity to cleanup operations and Team memner reports of safety violations or safety concerns.

Appendix G: SCAT Photography Guidelines

PURPOSE

There are several reasons to take photos in the field. In the end though the goal of SCAT photos is to tell a story about what happened. Each photo should tell a specific part. Before taking a photo you should consider what critical information you are trying to convey. Did the photo capture the details you need? Are there key images (data) that you have missed? In the first case you should reframe or retake the photo. In the second you should look for photos that will fill in the gaps. So remember – Make your photos tell the story of oiling conditions, including wildlife, important shoreline features, access points and other useful operational items.

BEFORE GOING IN THE FIELD

Preparing Gear

Make sure you have assembled a full photography kit appropriate for SCAT field work. Refer to the reference section of this document for the Full SCAT Gear checklist and the Field SCAT Gear checklist.

- Charge batteries (Generally every evening during a response.) Have at least one spare battery or extra sets of AA or AAA batteries if that is what your camera uses.
- Format memory cards (Be sure to save all images to a computer and/or the SCAT data managers, as all data will be lost during formatting. Also, formatting must be done with the camera they are to be used with, not the computer or other camera.)
- Check lens for dirt (Clean with special paper or cleaning cloth for that purpose to avoid damaging the lens coating.)
- Camera settings:
  - Resolution – High Quality (should generate a photo file size of 5 to 10 MB), assuming you have an adequate memory card for the whole day.
  - ISO – Is a measure of how sensitive the camera light sensor is. Use "Auto" and the camera will use the optimal ISO for the conditions.
  - Mode – Program (P) if you have any doubt. "Auto" may prevent using many of the recommended settings for SCAT.
  - Time stamp – OFF! Especially if you or the data managers are using GPS-Photo Link (NOAA does). Unlike film, there is no need to clutter your photo and use up pixel space with a time stamp. That information is automatically recorded in “EXIF” data–which is part of your image file.
  - Time – Local time. Avoid using the "GMT offset" feature as that can prevent proper import into some software
  - Continuous picture numbering – Set to use a running count for file names even after changing or formatting memory cards. You don’t want the camera to start from 1 each time.
  - Daily folders – Set camera to create a new folder each day. This helps with organization if you don’t download daily.
  - Advanced settings – Reset. If you use advanced settings like spot metering, custom white balance, etc. it’s a good idea to return these to auto or a general setting before you go into the field.
  - Camera reset – Most cameras have a way to return all settings to the factory default values. This is useful if images are poor or you’ve been experimenting with different camera settings and you can’t determine what setting may be causing the problem.

Learn Basic Camera Functions

It is absolutely critical that you know how to use the camera you will be using before you go into the field. With digital cameras, the photos are free; the basic advice for learning is practice, practice, practice. Note that during SCAT surveys, you will want to limit your photos to those useful to Planning and Operations, to avoid having to sort through them later. Remember, your photos should tell the story of what the SCAT team is finding.

The following are some basic camera functions that everyone should know. Many cameras require you to be in "P" (program) mode, not "A" (auto) to use these.

- Light metering: Spot. At this setting the camera meters the exposure at a designated spot in the photo frame. For most cameras the spot is shown as a box or circle in the center of the viewfinder. Spot metering is helpful if your priority subject is much darker or lighter than the rest of the frame.
- Light metering: Exposure compensation (+/-) adjustment. This lets you manually tell the camera to make the photo lighter or darker. It works like the lighter-darker adjustment on most copy machines.
- White balance adjustments: White balance settings help the camera adjust the colors in the photos based on the type of light (fluorescent, incandescent, sunny, cloudy, etc.) Most of the time Auto White Balance works fine, but sometimes the camera does not adjust correctly. Manually choosing the type of light can fix the problem.
- Review photos: Know how to use your camera display to review a photo. Know how to zoom in on the photo in the display screen to check focus, exposure, and other key details. The Tele – Wide buttons usually allow you to zoom once the camera is in review mode.
- Forced flash: In dim light or harsh shadows you may need to force the camera to use the flash to avoid losing details. If so, use the "Flash On" rather than the "Auto Flash" setting.
- Continuous shooting: Most cameras will shoot consecutive photos while you hold down the shutter, having the potential to generate many extra photos. Only use it if you have a need to record fast moving wildlife.

Learn Basic GPS Functions

Basic GPS capability is essential for all field work, including photography. After the field work, all photos can be geo-referenced using software such as GPS Photolink. There are a number of key functions you need to set including: local time zone, datum, track (wrap, interval), WAAS (on), etc. Refer to the companion "Basic SCAT GPS Management & Standards" guide for more detail.

Regarding Cameras with Built-in GPS – Most built-in GPS units in cameras don't provide the same functionality as good separate units, and they can use up batteries fast. On built-in GPS, it may not be possible to change the settings as recommended in our GPS user guidelines. Also, downloading the GPS files to the GPS-photo linking software generally used by the information management team does not work properly. **Bottom Line: Turn off the built-in GPS and use a separate GPS receiver!**

<u>In the Field</u>

What Photos to Take on a SCAT Survey

It is important to take a basic set of photographs of every segment during every survey, including:

- Overview photographs of the habitat: For coastal segments, it is best to stand just above the high-tide line and aim across the intertidal zone to the water line, to show shoreline type, slope, and oil location.

- Close-up photographs of all types of oil in each zone: Use a photo scale. Take photographs looking alongshore to show the width of the oil and vertically to show more detail.
- Photograph every pit: Use a photo scale on the sediment surface in the upper right side of the pit, if possible. Be sure that the pit wall is not covered by a shadow, that any oiled layers are clearly visible. Take a photo of the pit location on the shoreline.
- Oiled/dead wildlife: Use a photo scale and get as close as needed to be able to identify the species and the presence/absence of oiling.

Basic Photo Technique

Photos with scales

- 15 cm scales are standard. Be sure the scale is labeled. Commonly available scales use alternating yellow and black 1 cm bands.
- For oily conditions, use disposable scales of standard length, such as 15 cm long wooden sticks. (Use a photograph to document the length in relation to a printed scale).
- Scales should have intermediate reflectance, not all bright white. A bright scale can cause the camera to underexpose the rest of the photo.
- Try to place the scale consistently in one location. The lower right of the frame is recommended. NEVER place the scale near the center of the photo!
- The scale must be the same distance from the lens as the target object. Otherwise, the scale does not accurately reflect the target's size. A scale cannot be used for distant targets, but sometimes an object near the target can be helpful if its size is known or can be estimated.

Avoid harsh shadows

- Use spot metering or camera flash to eliminate harsh shadows that can obscure details. Use one of each if you're not sure which is better. Remember that setting the exposure for shadows may wash out and lose detail in bright areas of the photo.

Review critical photos

- Use the review feature to ensure that your photos show what you need.
- Use zoom-in function (often the "Tele-Wide" buttons) on the camera display to see if you captured necessary details.

Adjust camera if needed

- It is critical to make adjustments if photos are not coming out well.

Put every photo in perspective

Every close-up should be followed by one or more wider-angle shots that will show the close-up in the context of the rest of the environment. The closer the initial shot the more perspective shots are needed.

Consistent, repetitive photo process

Taking photos in the same order will help to ensure that you don't miss important photos and will help keep things organized so it's easier to review your photos later. The following are examples of how you might do this:

- Start each new location with panorama shots and maybe a narrative video.
- Always shoot your subjects from the most close-up to the most zoomed out.

Notes

- Note key photos and important details in field notes.

- Record basic information - locations, times, photographer, team members.
- Descriptions of GPS locations or waypoints. As backup, write down the Lat/Longs.

GPS Check

- Take waypoints for photos occasionally (good check later for GPS-photo synchronization)
- To document GPS accuracy, take photos at (not of) landmark locations shown on commercial maps. Note photo number and location.
    - Examples of landmarks: road intersections, coastal promontories, stream outlets, shore access locations, lighthouses, etc.

Flying

Taking photos from a plane or helicopter can be difficult and requires additional skills. Point and shoot cameras can take good photos from the air but SLRs typically perform much better.

- Use manual focus to set cameras to infinity (∞). This avoids accidentally auto focusing on the window.
- Image stabilized cameras or lenses will help.
- To prevent transmitting aircraft vibration to the camera, do not rest the camera on an aircraft window frame or other part of the aircraft structure. Instead, hold the camera with your arms braced against your legs or torso, or the camera held against your face.
- Avoid shooting through a bubble window. They can distort the image.
- Smaller aircraft often have sliding windows, or easily removable windows or doors. Make arrangements with your pilot before take-off.
- Consider using one zoom level. Survey flights often are directed to maintain a specific altitude. By maintaining a constant zoom level you will be able to compare items in successive photos. Remember, you can't use the small photo scales in aerial photos. However, if an object of known (or an estimated) size is near the target, it can provide a size reference or perspective.
- Notes to record: Capture the basic flight plan including altitude and distance from shore. Aircraft type. Pilot and passenger names. Where you are sitting, port or starboard.

Special Requirements for Litigation or Enforcement Photos

If you know or suspect that your photos may be evidence in a civil or enforcement case, then additional steps are needed, beyond what is provided in this guidance, to ensure the photos are litigation quality and have been handled, transferred, and archived using proper chain of custody procedures SPECIFIC TO DIGITAL PHOTOGRAPHY. Basic guidance includes taking high quality and useful photos for SCAT purposes. Save all raw images before manipulating or deleting. Make a copy set for photo editing or file naming. Seek specific guidance from your organization for protocols involving chain of custody of digital photography.

Secondary, but Useful, Reasons to take Photos: To Document the Incident, the Location, overall response efforts, and personnel.

SCAT photos are primarily used to document the team's findings for the response. However, the USCG and other federal and state agencies always have need of photos to communicate, in broad strokes, what happened. The audience may be upper level management, Congressional hearings, court, the USCG National Pollution Fund Center, public hearings, training talks, outreach events, etc. If time permits, try to capture the photos needed for all these audiences while in the field. You may not get a second chance. The following is a partial list of subjects to try to document:

- How the spill happened – including source

- Cleanup/remedial efforts
- Personnel working/sampling
- Direct observations of resource exposure or injuries
- Wildlife
- Survey platforms: boats, aircraft, trucks
- Vistas and scenery shots

In locations where a time series would be helpful, compose the photo so it will be easy to repeat. It is easy to repeat photos for a time series by standing in the same spot, centering the view on a permanent object, and using the same focal length ("zoom" setting). Take notes and bring a marked print when you return to take subsequent photos to help match the images.

Process: Logging photos

Locating photos in space and time is necessary to ensure that your photos are useful SCAT data and not useless files. In the field, record all photos in either your field logbook or a photo log form. After returning from the field, follow the "downloading" procedure established by the SCAT Coordinator and/or SCAT Team Leader. This will frequently involve bringing your camera and GPS unit to one of the Information Management (IM) Team assigned this function in the command or forward operations post. The IM member is usually located with the SCAT Coordinator. The IM Team may set up a database system for logging photos. If so, know what data and format is needed for that system.

A photo log or field notes should include:

Photographer
Date and Time
Note/Caption
Incident Name

Photography - Full gear list

☐	Camera	With neck strap
☐	Case – large	Sized to hold all your camera gear
☐	Case – small	Sized to hold and protect your camera and gear in the field
☐	Memory cards	1-2 extra depending on size – 200-300 full resolution photos on each is good
☐	Rechargeable batteries	Proprietary battery: 2 is OK, 3 is better AA: two sets of rechargeables are OK – you'll have extra alkaline or lithium in your kit for GPS, etc.
☐	Battery charger	One for each type of rechargeable you carry
☐	Lens cleaning kit	
☐	Card reader	Get one that accepts many card types so you can get photos from others.
☐	Cable – Camera to PC	Should come with the camera
☐	Camera manual	Paper and pdf
☐	Underwater housing or rain shield / kit	Optional - useful in rough weather and small boat ops. A few cameras are waterproof or have a compact underwater housing that only fits that model. These are not too heavy. Flexible vinyl underwater cases or rain shields can be folded up and are easier to take in the field if you need them.
☐	Photo scale	15 cm waterproof, 15 cm disposable. Not white or light colored. Grey or yellow and black are best
☐	Image viewing software	All computers have decent software for reviewing photos. Many cameras also have good viewing software.
☐	Image editing software	Optional. Good for processing photos for presentations etc.
☐	External hard drives	For storing and archiving lots of photos and backing up the computer hard drive.
☐	Photo logging database	Usually the Information Management team will have this.
☐	GPS-photo linking software	Usually the Information Management team will have this.
☐	DVD-Rs – NOT RWs	Primarily for litigation quality archiving. Usually the Information Management team will have this.
☐	Waterproof bag	Dry sack or heavy duty Ziplock bags
☐	Polarizing lens	Optional – reduces glare and reflections. They may interfere with recording oil sheens, so use caution.
☐	GPS	
☐	Field notebook	

Photography - Field gear list

☐	Camera	With neck strap
☐	Case – small	Sized to hold and protect your camera and gear in the field
☐	Memory cards	1-2 extra depending on size – 2-300 full resolution photos on each is good
☐	Rechargeable batteries	Proprietary battery: 2 is OK, 3 is better AA two sets are OK – you'll have extra alkaline batteries in your kit for GPS, etc.
☐	Lens cleaning kit	
☐	Underwater housing / kit	Optional - useful in rough weather and small boat ops. A few cameras are waterproof or have a compact underwater housing that only fits that model. These are not too heavy. Flexible vinyl underwater cases or rain shields can be folded up and are easier to take in the field if you need them.
☐	Photo scale	15 cm waterproof, 15 cm disposable. Not white or light colored. Grey or yellow & black are best
☐	Waterproof bag	Dry sack or heavy duty Ziplock bags
☐	Polarizing lens	Optional – reduces glare and reflections
☐	GPS	With a remote antenna if using in aircraft.
☐	Field notebook	

Appendix H: SCAT GPS Guidelines

PURPOSE

The use of modern Global Positioning Satellite receivers (GPS) allows very precise location information to be acquired by SCAT teams using small hand held GPS receivers. The team members can track and record their path, waypoints and other data for later download directly to a computer, to be linked with various GIS programs (including Google Earth).

Additionally, by taking certain steps prior to (or during, and sometimes after) field use, the GPS data can be linked to digital photos taken during the same time period by using software designed for this purpose (such as GeoJot Core by Geospatial Experts, used by NOAA). This allows the photos to be linked to a specific time and location.

This guide provides the appropriate GPS unit settings and actions for SCAT team use. In the event you are using a camera with built in GPS, these guidelines also apply to setting and using the GPS feature.

BEFORE GOING IN THE FIELD OR STARTING TRAINING

The following are basic GPS practices that SCAT field team members should follow. Specific GPS devices are not covered in this document since operation can vary from brand to brand or year to year. For more information please see your device's manual. **SCAT members for an actual response** are expected to become as familiar as possible with how their device works prior to actual response use. **Prior to SCAT training**, students should become familiar with these GPS procedures and the specific units they will use during training.

GPS Data Definitions

- Track or Trackline or Track Log: The "breadcrumb trail"; a stream of continuous data points recorded when the unit's Track Log is turned on, saved to the GPS memory (*ex. overflight path, extent of assessed shoreline*).
    - Active Track Log – Currently being recorded into the GPS' memory. The GPS-photo linking software (such as GeoJot) will only read an Active Track Log so we encourage keeping this file until everything has been processed for the day.
    - Saved Track Log – An Active Track Log compressed, named and saved in the GPS device. The GPS discards the time data track to save space. **You cannot geo-reference photos with a named track; we discourage using them**.
    - ***Important Note***: Do not save your track log as this will strip off important date/time information that is necessary for GPS-photo linking operations
- Waypoints: A specific location manually captured by the user and saved to GPS' memory (*ex. location of marine debris object, location of sample*). Enter specific names into unit or accept the default waypoint names and record them in your field notes.

GPS Setup

- Set time zone and/or GMT offset for the current field location *(see table below)*
- Set time format to 24 hour clock
- Set datum to WGS84 (make default if possible). It is **critical** to make sure the datum is set correctly. Coordinates are downloaded using the datum setting on the GPS. Conversion later can be difficult.
- Check battery levels before use each day. A fresh set or fresh charge is recommended every day. Carry extra batteries

- Adjust screen visibility if operating in bright sunlight or overcast skies (typically under the Setup menu)
- Set your GPS to provide coordinates in Decimal Degrees (e.g. 48.408) unless you have a specific need for coordinates in degrees minutes seconds (e.g. 48° 24' 30") or degrees decimal minutes (e.g. 48° 24.5"). This will make it easier for writing down coordinates in your Photo Log or notebook and using them in the future.
- Set Track options:
    - Choose an appropriate sampling rate *(5 seconds is good for driving or flying, 15 is more appropriate for walking)*. If you don't have time options, choose more often or most often
    - Set track to wrap when full (keeps the newest data)
- Begin each incident with a clean GPS clear of previous tracks or waypoints to avoid conflicting or confusing information.
- Download waypoints and tracks each day after field work and process accordingly *(see Data Management Plan, OziExplorer, or consult with data management team).* Refer to "Data Download" later in this guide for file formats to use.
- If you have an older GPS or are having problems with running out of memory, you can clear the day's track log but only after downloading AND processing your GPS data and photos. Waypoints typically do not need to be cleared as they may be used as reference on other days.

GPS Accessories (include in GPS kit)

- Data cable for downloading your unit to a computer (including adapters if needed)
- Waterproof bag or dry bag to protect unit and clip to a pack for easy access and consistent reception. Handheld units are generally waterproof, but extra protection helps, plus they generally don't float.
- External antenna if you plan to fly. You may need to position the antennae around the platform to get good reception. A suction cup mount is best to stick to windows. Most aircraft have very few magnetic surfaces.

Data Collection (Check device manual for specific instructions)

- Unit should be able to locate and track at least 3 satellites to provide precise location data.
- Waypoints – Click the MARK option or hold down Enter to capture a point location. Select OK to save the waypoint. Use a field data sheet or notebook to write down waypoint ID and notes. If time permits, recording the Lat/Lon manually is also a good idea.
- Track Log – Ensure the GPS is recording a track. ***DO NOT SAVE your track file in the GPS***.

Field Use

- Leave GPS on while in the field for the day. This will ensure that it is recording a track log for all of your photos. Most GPS units will have plenty of memory and power to handle a full day – see above about checking battery levels!

If you plan to use your GPS data to sync up with photos that are being taken in the field (such as with GeoJot software used by NOAA):

- Take a photo of GPS showing its date and time stamp with seconds designation each day before heading out. Immediately review photo in your camera for glare and blurriness problems and retake if necessary. It's important that this photo is clear and easily legible.
- It is not necessary to take waypoints of photo locations while simultaneously shooting photos. The track line and photos will sync up later.

- Check GPS batteries every evening. Charge or replace them as needed. It's important to carry spare GPS and camera batteries when in the field.

Data Download

Your GPS data can be downloaded in a variety of ways using different applications. The most important step to remember is downloading the original data in a format so it can be uploaded again, used in other applications, or saved for long-term data management. MapSource by Garmin or OziExplorer on your computer are suitable for managing the original data.

- **MapSource Garmin** – Full GPS data management. Can create waypoints and tracks, shapefiles and KML/KMZ files. Has worldwide coverage of roads. Navigation charts for Garmin can be purchased. Save data as both Garmin Database (.gdb) and GPS Exchange (.gpx) formats.
- **OziExplorer** – Full GPS data management. Can upload data, nautical charts, etc., and download tracks and waypoints. Creates ArcGIS shapefiles and Google Earth KML/KMZ files. Works with almost all GPS devices. License and software installation required for use.
- **MN DNR Garmin** – Free download from Minnesota Department of Natural Resources that manages GPS data and also creates a toolbar for use in ArcView. Can export waypoints and tracks to Google Earth or ArcGIS and perform basic hot-linking. Supports only Garmin GPS devices. ***Do not use this software to download a GPS Track Log as the .gpx format is incompatible with some GPS-photo linking software, and you will not be able to link photos with GPS locations.***

If you need to import your GPS data for visualization, but not GPS management, then you can use the following tools:

- **GeoJot Core by Geospatial Experts** – Can import Garmin tracks and waypoints or Magellan tracks and sync them to digital photos. License and software installation required for use.
- **Google Earth** – Can import waypoints and tracks directly from Garmin or Magellan devices and save them as KML files. This is not recommended for long-term data management.

GMT Reference

Time Zone	GMT Standard Time	GMT Daylight Savings
Puerto Rico & USVI	-4	-4
Eastern	-5	-4
Central	-6	-5
Mountain	-7	-6
Pacific	-8	-7
Alaska	-9	-8
Hawaii & Guam	-10	-10

There are some idiosyncrasies in the U.S. but this is a general reference.

Appendix I: Step-by-Step Guidelines for Filling out the Shoreline Oiling Summary (SOS) Form

Section 1

Section 1 includes general information about the segment, date and time of the survey, etc. You will be given the segment ID on a base map, or you will be generating them in the field for the first survey of the segment. The tide height during the survey is very important to record. In the example below, the survey was started about mid-tide when the tide was falling.

1. GENERAL INFORMATION	Date (dd/mm/yyyy) (please use month name)	Time (24h standard/daylight) (00:00 to 00:00)	Tide Height
Segment ID: GI-01	20 Jun 2014	10:15 to 13:00	L / M / H
Segment Name: Grand Isle			Rising / Falling
Survey By: Foot / ATV / Boat / Helicopter / Overlook / Other ____		Weather: Sun / Clouds / Fog / Rain / Snow / Windy / Calm	

Section 2

The names and organization of each member of the team must be recorded in Section 2, along with the Team Number.

2. SURVEY TEAM	Name	Organization	Name	Organization
Team Number	John Smith	USCG	Tom Brown	RP
	Mary Jones	NOAA Smith	Beth Young	Arch
2	Bill White	State		

Section 3

This is where you record the total length of the segment (it can be estimated in the field or generated later using the waypoints). If you were not able to complete the segment, record the length that you were able to survey (and be sure to note that on the map as well). Everyone on a SCAT team should know how to use a GPS and set waypoints (see guidelines in Appendix H). Waypoints are a very efficient way to accurately record the locations of the segment boundaries (as well as other features in the segment such as pits). Before you go out into the field, make sure that the GPS you are using has the Datum set to WGS84 and the coordinates set to Decimal Degrees (e.g., 48.408). When you start a segment, locate the starting point and collect a waypoint and write down the coordinates. When you decide to end this segment and start a new one, repeat this process.

3. SEGMENT	Total Length: 300 m		Length Surveyed: 300 m		Datum: WGS84
Survey Start GPS:	WP: 111	LAT: 29.10362		LONG: 90.36169	
Survey End GPS:	WP: 120	LAT: 29.10364		LONG: 90.36178	

Section 4

The **BACKSHORE Character** refers to the shore zone as a whole and includes the area inland and landward of the intertidal zone. This is the area where operational activities to implement the treatment recommendations take place. It defines access constraints to the intertidal zone as well as the potential for staging areas adjacent to the segment to be treated. In the example below, the backshore consisted of a beach with some riprap in front of a structure.

The **ESI Shoreline Type** refers to the intertidal habitat (between low and high tides). Refer to Table 1 in the Shoreline Assessment Manual for the ESI shoreline types and numbers. The Primary shoreline type is the one that is most common within the segment. The Secondary shoreline type(s) are all the other shoreline types that are present within the segment. You should circle all the shoreline types that are oiled. In the example below, a fine-grained sand beach (ESI = 3) is the Primary shoreline type; there are also riprap (ESI = 6B) and salt marshes (ESI = 10A) present. All the shoreline types have some oiling.

4a. BACKSHORE CHARACTER: Indicate only ONE Primary type and ALL Secondary types	
Cliff/Slope ___ Lowland ___ Beach P Dune ___ Wetland ___ Lagoon ___ Delta ___ Channel ___ Man-Made S: _____	
4b. ESI SHORELINE TYPE: Indicate only ONE Primary (P) and ANY Secondary (S) types. CIRCLE those oiled.	
Primary: 3	Secondary: 6B 10A

Section 5

The **Operational Features** provide information on the presence, type, and amount of oiled debris. Note that bags generally are filled to 20 pounds, to make them easier to handle by workers. It is important to provide information on access to the segment, from either the immediate backshore or from adjacent segments, and if the backshore area is suitable as a staging area for equipment, worker deployment, and waste handling. Describe in as much detail as possible about the backshore access. Make additional notes under Section 8 (Comments) as necessary.

5. OPERATIONAL FEATURES	Oiled Debris? Yes / No	Type: Wrack	Amount: 10 (bags)
Direct backshore access? Yes / No	Alongshore access from next segment? Yes / No		Suitable for backshore staging? Yes / No
Access Description / Restrictions: Road/parking lot with good access to shoreline			

Section 6

The **Surface Oiling Description** section applies to oil on the surface (defined as oil on the shoreline surface and down to 5 cm in the surface sediments). You assess the oiling by walking the entire segment.

If no surface oil is present, mark the NO box under Oil Character

If surface oil is present:

STEP 1: Decide if the oiling in the segment is relatively uniform in terms of the shoreline type, tidal zone location, width, % distribution, oil thickness, and oil character.

- If **Yes**, there is only 1 zone to be described in STEP 2.
- In **No**, then you need to break the segment into multiple zones, each with it's own descriptors. These zones can be alongshore (e.g., one end of the segment has much higher oil accumulated against a riprap groin) or cross-shore (e.g., most of the oil is located in the upper intertidal zone, but there is a small amount of oiled debris in the supratidal zone).

STEP 2: For each zone, decide the start and end of the zone and record the waypoints. Enter the Environmental Sensitivity Index (ESI) shoreline type, tidal zone, length and width of the oiled zone, the average % distribution of oil within that length and width, the oil thickness, and oil character. In the example below, the oil occurs in 2 zones: A = the sand beach along the entire segment where the oil occurs in the upper intertidal zone and is 3 m wide, 15% distribution, 0.5 cm thick (=cover), and fresh oil; and B = a riprap revetment in front of a structure where the oil occurs in both the upper intertidal and supratidal zones and is 2 m wide and 25% distribution of fresh oil that is thicker than 1 cm (=thick oil or TO) in places (so both TO and CV are marked).
There is also a small marsh (ESI = 10A) in the segment that had 2 patches of thick oil in the entire marsh, so this was recorded in the column under <1% as 2/20 m^2 with the average and largest size of the patches being 2 cm.

STEP 3: Mark each zone on a map or make a sketch of the segment showing the locations of the zones.

6. SURFACE OILING DESCRIPTION: Indicate overlapping zones in different tidal zones by numbering them (e.g. A1, A2)

Zone ID	ESI Type	WP Start	WP End	Tidal Zone				Oil Cover						Oil Thickness					Oil Character							
								Zone Area		1-100%	<1%	Size														
				LI	MI	UI	SU	Length (m)	Width (m)	Distr. %	# per unit area	Avg Size (cm)	Large Size (cm)	TO	CV	CT	ST	FL	FR	MS	TB	PT	TC	SR	AP	No
A	3	111	118			X		300	3	15					X				X							
B	6B	112	113			X	X	50	2	25				X	X				X							
C	10A	113	114				X	10	2		2/20m^2	2	2	X					X							

Section 7

The **Subsurface Oiling Description** section applies to oil below the surface. Dig pits in areas with surface oil and in depositional areas to look for oil that may be buried. In the example below, 5 pits were dug into the sand beach (Zone A), so they were numbered A-1, A-2, etc. Record the waypoint for each pit (or locate it on your base map or sketch), the substrate type (e.g., pebble, sand, mud, etc.) both at the surface and with depth, and the location of the pit in the intertidal zone. Try to dig pits to at least 50 cm, or to the water table, and record the pit depth. The oiled interval is the depth below the surface where the oiled sediment occurs. In the example below, pit A-1 had oil from the surface to 6 cm; pit B had clean sand from the surface to 5 cm, and oiled sand from 5 to 10 cm, and clean below that to a depth of 45 cm. Both pits were dug to 45 cm because that is where the water table was encountered. Note that when water accumulates in the pit, you need to record if there is a sheen (and it's color as brown, rainbow, silver, or none) on the water surface. Pits A- 3 and A-4 (dug in the upper intertidal zone) and Pit A-5 (dug in the middle intertidal zone) had no subsurface oil.

7. **SUBSURFACE OILING CONDITIONS**: Format: Zone ID dash Trench Number in that Zone, e.g., "A-1, B-1, B-2"																					
Pit #	WP	Substrate Type Surface / Subsurface	Tidal Zone				Pit Depth (cm)	Oiled Interval (cm-cm)	Subsurface Oil Character											Water Table (cm)	Sheen Color B,R,S, N	Clean Below Yes / No
			LI	MI	UI	SU			OP	PP	OR	OF	TR	TB	SR	AP	NO	%			
A-1	115	sand/sand			X		45	0-6			X								45	N	Yes
A-2	116	sand/sand			X		45	5-10			X								45	N	Yes
A-3	117	sand/sand			X		50										X				Yes
A-4	118	sand/sand			X		50										X				Yes
A-5	119	sand/sand		X			25										X				Yes

Section 8

The **Comments** section is where you summarize the oiling conditions and make recommendations for treatment, record observations on wildlife, and other comments. You also note photographs and if there is a sketch or map attached.

8. COMMENTS: Cleanup Recommendations; Ecological/Recreational/Cultural Issues; Wildlife Observations; Oiling Descriptions
Recommend manual removal of oil from sand beaches. Attached map/sketch shows small area adjacent to the riprap where there is some subsurface oil. The riprap revetment has both oil coating on the surface of the blocks, and some thick oil and oiled debris inside the crevices. Recommend manual removal of the thicker oil, followed by high-pressure, hot-water flushing of the remaining thinner oil. This is a public beach, with good access and staging areas. Observed and reported to the Wildlife Hotline one oiled gull.
Sketch: Yes (No) Photos: Yes (No) Photo Numbers: (Team 2: 1-14) Photographer Name: Jones

Executive Summary

- Response operations in tidal inlets face numerous challenges: the most important of which are the constantly changing water depths and current patterns.

- Recognition of the typical morphological features of an inlet system enables planners and responders to understand how water depth and current pattern change through the tidal cycle.

- This understanding should form the basis for the selection of realistic and practical response strategies to minimize the transport of oil through an inlet on a flooding tide toward vulnerable back-bay environments.

- In reality, there are a number of positive strategies and tactics that can be implemented to control the potential movement of oil through an inlet and the purpose of this study is to identify those opportunities for planners and responders.

Tidal inlets are complex and dynamic systems that include ebb and flood tidal deltas on either side of an inlet throat between barrier islands. These systems provide pathways for oil to enter sheltered back-bay tidal flats, marshes and mangroves (bay-lagoon complex) and are critical control points for protection of these sensitive and vulnerable environments. The key challenges that planners and responders face include:

- constantly changing patterns of shoals and channels that are controlled by the balance between wave and tidal forces and bay geometry;

- intertidal areas that are often wide and alternately exposed and submerged during each tidal cycle;

- current reversals approximately every 6 or 12 hours, depending on the type of tide; and

- high current velocities in channels and wave-induced currents across ocean-side shoals.

This report addresses these challenges and provides guidance to understand the morphology and processes within tidal inlets so that locations can be identified where protective operations are feasible and strategic approaches can be developed.

The results of this study are intended for use by planners and responders and can form part of response plans, Area Contingency Plans, or Geographic Response Plans. The process of identifying practical strategic and tactical options can help ensure that expectations are realistic and that appropriate types of equipment are available for inlet protection at specific locations. During a response operation, the Guide can be used to ensure that available resources are put to best use and that decision makers select practical strategies based on the environmental conditions at the time. The Guide provides separate stepwise approaches for preplanning activities and for response decisions.

Development of potential response strategies is directly linked to the characteristics of the tidal inlet system. These characteristics can be used to indicate locations where general strategies (such as exclusion, deflection, diversion to shore, containment and recovery) may be feasible. Guidance is also provided to assess the practicality of candidate strategies in terms of limits and conditions associated with

supporting tactics and equipment. Non-conventional tactics and equipment may be required in many situations.

Response operations at a tidal inlet become necessary if open-water strategies cannot prevent oil from approaching an inlet on a flooding tide (i.e. with inflow to the back-bay environment). The favorable opportunities (green boxes) and the least practical situations (red boxes) for response strategies during a flooding tide, when oil is most likely to be transported into a back bay through an inlet system, are illustrated in Figure E.1. For most inlet systems, response strategies during a flooding tide are limited to the marginal channels of both the ebb- and flood-tidal delta areas. Within these areas of opportunity, the preferred options are to divert oil towards on-water or shoreline recovery areas. Protective strategies are limited primarily to flood tide conditions as an ebbing tide typically holds oil offshore.

LOCATION	Inlet Feature	STRATEGY (Flood Tide)

Tidal Inlet Protection Strategies (TIPS)
Final Report

1 Introduction

Tidal inlets are found on barrier beaches worldwide and form a connection between the open-ocean and environmentally vulnerable sheltered bays, lagoons, marshes and tidal creeks. Inlets can be complex, variable, and challenging environments for oil spill control. The development of successful protective strategies requires:

a. basic understanding of the morphology and processes of the tidal system; and

b. knowledge of feasible and specialized tactics and equipment (including limitations and operating requirements) for operation in tidal environments.

1.1 Purpose of the Study

This report presents an approach for the development of Tidal Inlet Protective Strategies (TIPS) which are based on knowledge of the physical systems involved and feasibility of tactical options. Strategies and tactics identified using the results of this study are subject to real-time conditions and pre-spill planned strategies should be re-evaluated during a response. The report considers potential tactics at a level appropriate for strategic planning, but is not intended to provide instructions for the implementation of those tactics. The Guide is intended to be used by strategic planners and responders, and may be appropriate for inclusion in an Area Contingency Plan (ACP) or a Geographic Response Plan (GRP).

1.2 Scope

The Scope of the Report is divided into three major components:

- INLET CHARACTER AND DYNAMICS—Section 2 provides an understanding of the physical dynamics of tidal inlet systems, which include Ocean side and Bay-Lagoon side tidal deltas as well as the inlet or tidal throat itself.

- PLANNING—Section 3 focuses on planning considerations, such as oil transport and operational opportunities and constraints.

- RESPONSE—Section 4 describes generic response strategies, provides a guide for the selection of tactical options, and presents the special requirements and limitations of tactics and associated equipment, which may be feasible for operation in the unique tidal inlet environment.

Strategies to prevent oil from reaching sheltered bays and lagoon can involve a range of offshore and nearshore options that include mechanical recovery, controlled burning, and dispersants, although it is unlikely that burning or dispersant application would be used in the immediate proximity of a tidal inlet. The response options in and around inlets focus primarily on mechanical recovery and booming strategies for a variety of practical reasons and environmental concerns. Physical solid barriers, such as dams, have been used historically with mixed results and may cause environmental impacts by cutting off the water exchange between the ocean and back bays. In addition, the effort required for the construction of dams and other engineering options, such as pilings, in tidal channels can be time consuming and may preclude their use when immediate action is required.

As the focus of the report is on providing guidance for the selection of appropriate strategies within a tidal inlet system, minimal attention is given to more conventional interior containment and control actions in back bay or lagoon areas. A range of tactical implementation manuals provide detailed information on equipment types or specifications and how they can be deployed effectively (e.g. ExxonMobil 2008: Hansen and Coe 2001).

The report focuses on floating oil from offshore sources rather than oil that may sink, submerge or be neutrally buoyant and is intended for use at larger inlets. Protection strategies and response guidelines for small tidal channels or ephemeral inlets, that are typically less than 200 m (220 yards) wide and 1 m (3 feet) deep on sand beaches, are the subject of a separate report and field guide: API Technical Reports 1150-1 and 1150-2 respectively (API 2013 a and b)

1.3 Organization and Content

Section 2 describes and explains the key physical features of inlet systems:

- Section 2.2 provides a summary description of the MORPHOLOGY, or form, and character of inlets and the physical PROCESSES that operate in an inlet system.

- Section 2.3 presents a methodology to RECOGNIZE KEY COMPONENTS and PATTERNS for response planning and provides a TEMPLATE to summarize the physical character of an inlet.

- Section 2.4 describes the manner in which water depth and current patterns constantly change through the tidal cycle, so that the challenges associated with operations in an inlet system can be understood.

Section 3 considers strategic planning for practical response options in a tidal inlet system in the context of typical floating oil transport pathways (Section 3.1) and inlet dynamics (Section 3.2). Two key factors in the development of strategic decisions are understanding (a) where and when OPPORTUNITIES may exist for effective, diversion and/or containment and recovery (Section 3.3), and (b) typical operational, logistics and access CONSTRAINTS (Section 3.4).

Section 4 applies the knowledge of the dynamics of inlet systems and of the changing pattern of opportunities and constraints to enable the development of OBJECTIVES and STRATEGIES that may effectively control oil transport and protect sensitive back-bay environments.

- Section 4.1 describes the generic protection strategic options (Table 4.1) and discusses key information requirements for response planning.

- Section 4.2 provides a guide to the selection of Tidal Inlet Protections Strategies (TIPS). RESPONSE GUIDELINES are presented in the context of MORPHOLOGY and GEOGRAPHIC LOCATION and in terms of different STAGES of the TIDAL CYCLE (Figure 4.1).

- Section 4.3 provides brief discussions of limitations and requirements of individual RESPONSE TACTICS and associated equipment necessary to implement proposed protection strategies. This section includes a set of “RULES OF THUMB” (Section 4.3.2) related to practical considerations based on operational experience to assist in the strategy/tactics selection process. Tactical guidance for fourteen options is presented in Section 4.3.3.

Appendix A provides two USER GUIDES for pre-spill planning (Section A.1) and for guidance during a response operation for which there has been no pre-spill development of inlet protective strategies (Section A.2).

Appendix B provides a working example of the method presented in Section 2.3.1 to recognize inlet components from charts.

Appendix C provides an interpretation of the tidal delta components from a satellite image based on the methodology described in Section 2.3.3.

2 Key Physical Features of Tidal Inlets

2.1 Introduction

Tidal inlets are commonly created either through storm-generated scour channels or by spit growth across an open bay or estuary (Hayes 1991). Currents generated by the tidal exchange between the ocean and bay or lagoon maintain the main channel of a tidal inlet. The currents slow as the main channel (the “inlet throat”) widens on either side of the inlet and deposit sediment to form shoals or underwater deltas.

Inlets are most frequent in coastal environments with a mesotidal range (2-4 m: 6-12 feet). Sediment transport and inlet morphology are dominated by wave processes in coastal environments with a low tidal range (<2 m: <6 feet). As tidal range increases, the role of waves diminishes whereby inlets are rarely found on coasts with ranges greater than 4 m (12 feet), because wave energy is insufficient to form a barrier coast.

The importance of selecting protective strategies to match the physical character of an inlet and the associated current patterns has been recognized for many years (e.g. Hayes and Montello 1995: NOAA 1994: Owens *et al*. 1985) and this report builds on these studies to provide a summary of the relevant factors that should be considered by regional and local planners. Inlets can be viewed as complex and dynamic physical features of a coast, but at the same time all inlets have common features that are relatively simple to understand and that are relatively straightforward in terms of oil spill response options.

This section of the report provides an understanding of the physical character of tidal inlet systems that can be used for pre-spill planning and during response operations.

2.2 Generic Model for Oil Spill Response

The character of a tidal inlet results from a combination of geologic and oceanographic factors that include wave action, tidal range, the tidal prism in the bay or lagoon, freshwater input to the bay or lagoon, sediment availability, and alongshore sediment transport. These factors combine in a dynamic setting to create site-specific and unique current patterns and morphologies that vary depending on short-term or seasonal changes in wind and wave processes and changes in water levels associated with wind-driven (meteorological) tides, predicted astronomical tides, and seasonal river run-off.

Despite the complexity and dynamic character of tidal inlets, a number of parameters are relatively constant in the short term (weeks to months). The parameters include:

- sheltered versus open coast wave environments;

- predicted tidal water level changes;
- tidal current patterns;
- the overall morphology or shape of the tidal deltas on either side of the inlet throat; and
- the location, character and function of the channels through which tidal currents flow.

As these parameters are relatively constant, a generic inlet model has been developed that can be the basis for understanding how oil might be transported through an inlet and the response constraints that result from water depths, water level changes, and current flow directions and velocities.

The dominant feature of an inlet is the INLET THROAT. This is a narrow and relatively deep channel that is formed between two sand barriers (Figure 2.1). Within the channel, current speeds are high as water flow is constricted and sediment is transported on or near the sea bed into a bay or lagoon by flood currents or seaward toward the open ocean by ebb currents.

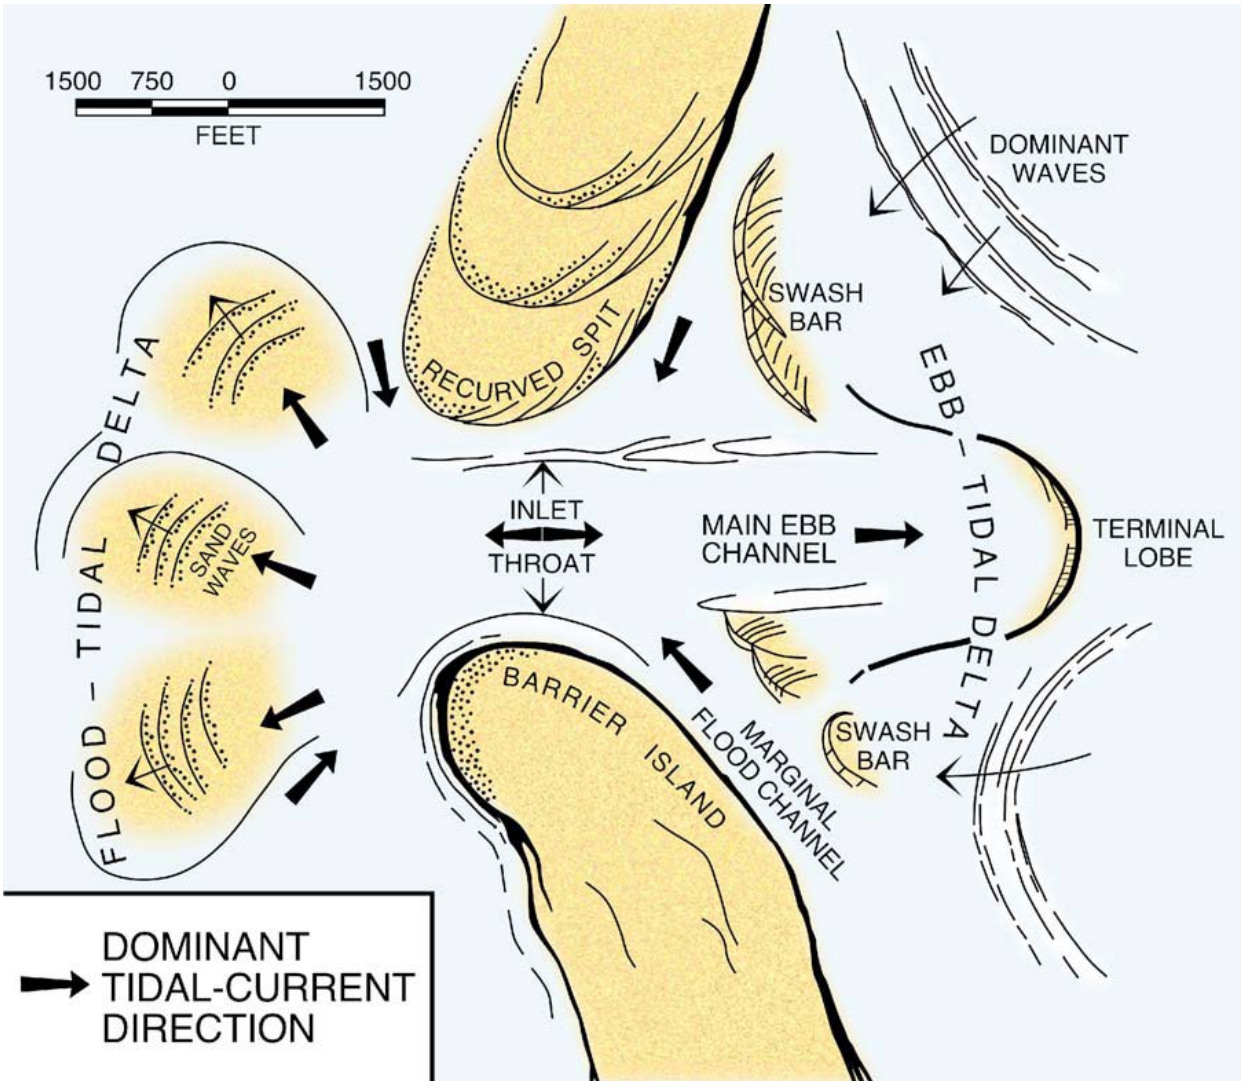

Figure 2.1. Key Features of a Tidal Inlet System (Hayes 1991)

The generic model is based on two primary environmental settings: the ocean side of the inlet system which is dominated by an EBB-TIDAL DELTA (Section 2.2.1), and the sheltered bay-side or lagoon environment which is dominated by a FLOOD-TIDAL DELTA (Section 2.2.2).

The symmetry of shoals and channels depicted in Figure 2.1 is rare, as inlet morphology is controlled by the relative magnitude of tidal and wave energy as well as the confines of bay geometry (Hayes 1975, 1991). Variations related to offset or overlapping inlets are discussed in Section 2.2.3 and to man-modified inlets in Section 2.2.4.

2.2.1 Ocean-Side Ebb Tidal Delta

The ebb tidal delta is a shoal built seaward by sand deposition as ebbing tidal waters slow and expand after passing through the constricted inlet throat (Figures 2.1, 2.2 and 2.3). The sediment at the terminus of the main ebb channel is reworked by wave action typically to create a rounded or arcuate form (#4 in Figure 2.2). Wave action moves sediment landward on the swash platform in the form of landward migrating swash bars (#5).

The ebb deltas can be intertidal or subtidal and breaking waves across shoals may limit boat or boom deployment operations. Adjacent to the inlet throat, the main ebb channel (#1) is flanked by marginal flood channels that are close to the shoreline (#2). These channels are significant in terms of oil transport as these are the first tidal waters to enter the inlet even as flow continues to ebb in the main channel, which may occur after low slack water in the bay.

The general shape of an ebb-tidal delta and the distribution of its sand bodies are determined by the relative magnitude of different sand transport processes operating at a tidal inlet. At tide-dominated inlets, the ebb-tidal deltas tend to be elongate having a main ebb channel and channel margin linear bars that extend far offshore (Figure 2.3). Wave-dominated inlet systems tend to be small relative to tide-dominated inlets. Their sediment shoals are driven onshore, close to the inlet mouth by the dominant wave processes. In many cases the ebb-tidal delta of these inlets is entirely subtidal. In other instances, sand bodies clog the entrance to the inlet leading to the formation of several major and minor tidal channels.

Mixed energy tidal inlets typically have a well-formed main ebb channel boarded by a broad swash platform and sand bodies that widely overlap the adjacent inlet shoreline. The example in Figure 2.4 is in a sheltered wave environment (Cape Cod Bay) with a 3 m (9 foot) tidal range.

Ebb-tidal deltas may also be highly asymmetric such that the main ebb channel and its associated sand bodies are positioned primarily along one of the inlet shorelines. This configuration normally occurs when the major back barrier channel approaches the inlet at an oblique angle or when a preferential accumulation of sand on the updrift side of the ebb delta causes a deflection of the main ebb channel along the down drift barrier shoreline. In the example shown in Figure 2.5 the construction of a spit platform (updrift sand accumulation) caused by a dominant wave approach direction has resulted in a deflected main ebb channel. Small marginal flood channels border the sides of the inlet.

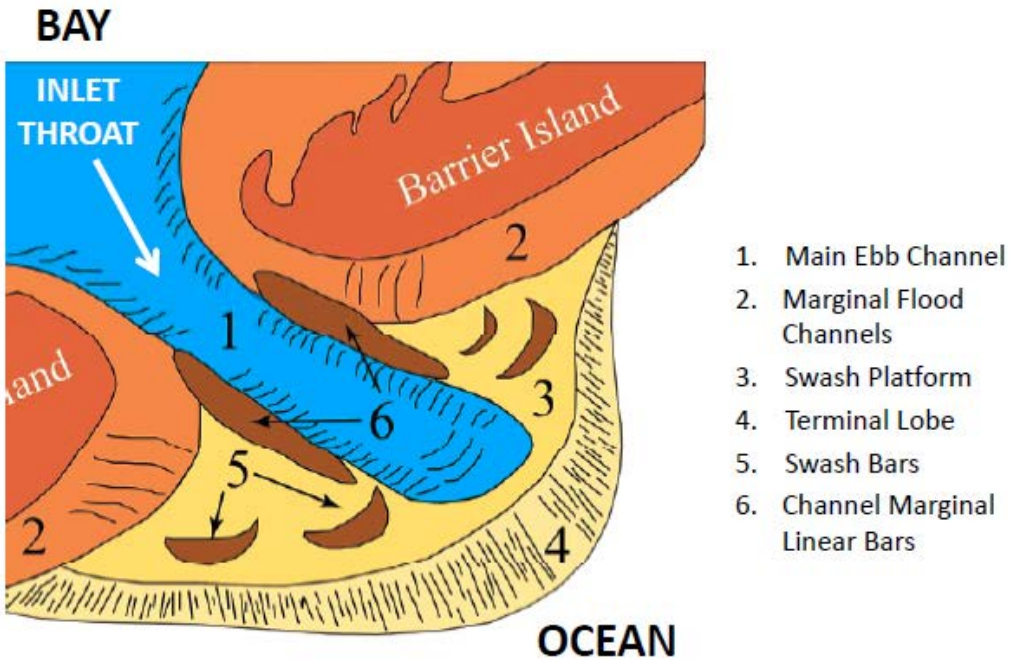

Figure 2.2. Morphological Components of a Generic Ebb-Tidal Delta

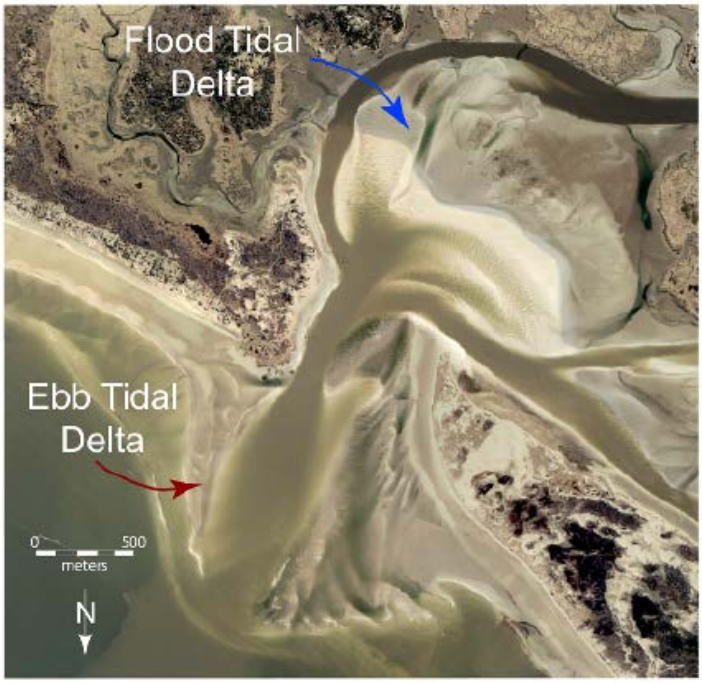

Figure 2.3. Satellite Image of Essex River Inlet (See Figure C.1)

Figure 2.4. Vertical Image of a Mixed-Energy Inlet, Sandy Neck, MA (See Appendix B)

Figure 2.5. Oblique Photograph of a Mixed-Energy Inlet

2.2.2 Bay-Side Flood Tidal Delta

The flood tidal delta forms in sheltered waters as sediment being carried into a bay or lagoon by the flooding tides is deposited (Figures 2.1, 2.3 and 2.6). This deposition results from the slowing of the current as the channel widens and flow expands once the water has passed through the narrow inlet throat.

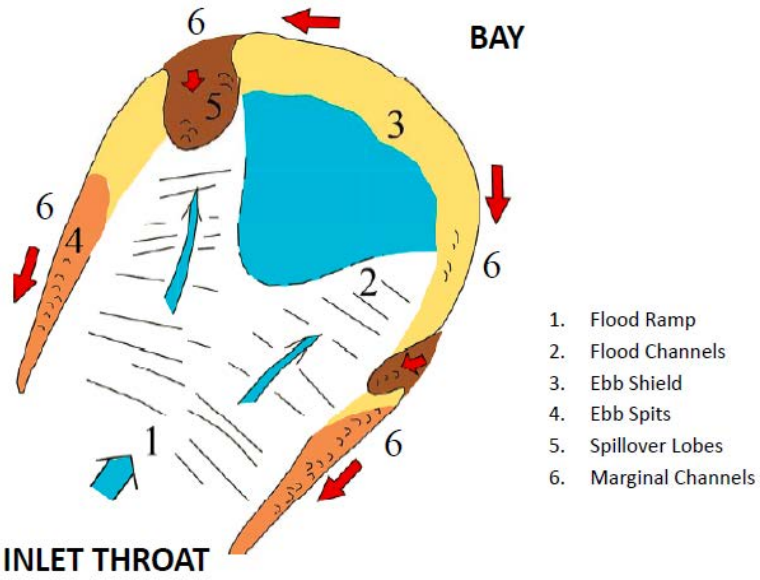

Figure 2.6. Morphological Components of Generic Flood-Tidal Delta

The flood delta contains exposed shoals at low tide so that water moves into the bay or lagoon through marginal channels (#6 in Figure 2.6) during the early and mid-flood stages. In the late-flood stage, the delta is largely or completely submerged as water then also flows through the flood channels (#2) across the flood ramp (#1) (Figure 2.7). The sand deposits are typically composed of sheet-like lobes of sand with landward-sloping ramps on their seaward sides covered by landward migrating waves of sand.

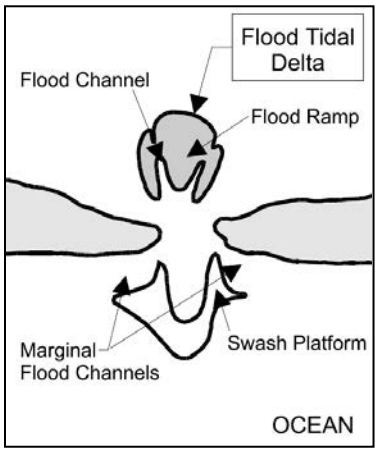

Figure 2.7. Key Depositional Features During a Flood Tide

After high tide, ebb flow is deflected by the ebb shield (#3) to marginal channels on both sides of the delta (#6) as the delta is slowly exposed by the falling water level. These currents carry sediment seaward, creating ebb spits (#4) on the flanks of the delta, which in turn help define the marginal channels (#6) that constrict both the late ebbing and the early flooding tidal waters.

Tidal inlets that are backed by a system of tidal channels, tidal flats, and salt marsh usually contain a single horseshoe-shaped flood-tidal delta (i.e., Figure 2.3). Contrastingly, inlets that are backed by large shallow bays may contain multiple flood-tidal deltas. Along some microtidal coasts, such as Rhode Island, flood deltas form at the end of narrow inlet channels cut through the barrier. Changes in the locus of deposition at these deltas produce a multi-lobate morphology (e.g. Figure 2.1) resembling a lobate river delta (Boothroyd 1978). Flood delta size commonly increases as the tidal prism increases and as the amount of open water area in the back barrier increases. In some regions, flood deltas have become colonized and altered by marsh growth, and are no longer recognizable as former flood-tidal deltas (Table 2.1). At other sites, portions of flood-tidal deltas are dredged to provide navigable waterways and thus, are highly modified.

Flood-tidal deltas are best developed in areas with moderate to large tidal ranges (1.5 to 3.0 m) because in these regions they are well exposed at low tide. As tidal range decreases, flood deltas become largely sub-tidal shoals.

Table 2.1. Summary of Inlet Morphology Variations (Modified From Hubbard *et al*. 1979 and Hayes 1991)

	INLET ENVIRONMENT		
VARIABLES	**WAVE DOMINATED**	**TRANSITIONAL**	**TIDE DOMINATED**
Primary Depositional Area	**Bay Side**: Small to large lobate or multi-lobate flood delta **Ocean Side**: Small ebb delta located close to shore	**Throat**: Wide with one or more tidal channels and sand shoals	**Ocean Side**: Well developed ebb delta that may be partly submerged. Contains small shoals and channel margin linear bars.
Secondary Depositional Area	**Ocean Side**: Small sand shoals located close to shore	Individual sand shoals or islands with one main channel	**Bay Side**: Flood delta well developed or colonized by marsh grass
Main Channel (Throat) Character	Small with one or more shallow channels and shifting sand shoals	Variable and changes during storms	Deep: narrow: stable: ebb dominated
Width/Depth Ratio	Variable: mostly high	Large but channels may be deep	Small
Channel Margin Bars	Absent	Variable	Large

2.2.3 Overlapping and Offset Inlets

- Overlaps can develop where there is a sufficient sand supply and a strongly dominant direction of wave approach and longshore transport.
- At stable inlets, the tidal prism maintains a permanent main channel, forcing sand to bypass the inlet along the ebb-tidal delta shoals.
- Although overlapping inlets are stable in the short term (months to years), the up-drift barrier spit may be breached during storms to create a new inlet; the original inlet may close as the tidal prism is reduced by this new exchange pattern; the new inlet may migrate along shore as part of a long-term (decades) cycle of breaching and inlet migration.

- A prevailing or dominant wave approach direction frequently creates an offset as waves refract around the delta: this results in a down-drift offset as the beach progrades seaward (Figure 2.8).

The inlet illustrated in Figure 2.8 has a plentiful sediment supply and a dominant alongshore transport direction to the south. This is a microtidal coast with a tide-dominated inlet having a low tidal range (1.0-1.5 m) but the inlet system has a large bay area and large tidal prism.

Figure 2.8. Vertical Image of Overlapping Inlet: Eastern Sakhalin Island, Russia

2.2.4 Man-Modified Tidal Inlets

- On the ocean coasts the primary human impact is associated with jetty construction, or dredging, or a combination of both.
- This type of coastal engineering work is intended to enhance navigation by stabilizing the inlet shoals or maintaining a specific channel depth.
- Most of these changes are long-term (years) and can result in alteration of both the ebb and flood-tidal delta components.
- Typically a jetty interrupts the alongshore transport of sand to the inlet channel—the result is a buildup of sand on the up-drift beach and coincident erosion on the down-drift beach where the sand supply is reduced or cut off.
- Typically the construction of jetties results in more concentrated tidal flow that moves the ebb-tidal delta seaward.
- In some instances the interruption of natural sand bypassing has been offset by pumping sand from the prograding up-drift to the eroding down-drift beach.
- In back-bay environments the construction of barriers, such as causeways, and filling or dredging can significantly alter the tidal prism and natural sand transport system.
- Again, increases or decreases in the tidal prism result in long-term changes that can involve an enlargement or the closure of an inlet, respectively.

2.3 Recognizing the Components of a Tidal Inlet

The purpose of this Section is to enable planners and responders to recognize typical changes in depth and current patterns at an inlet through a tidal cycle. The method follows a step-wise process by which nautical charts provide depth data and oblique aerial photographs, videos, vertical photographs and satellite images (e.g. Google) assist in the identification and definition of the different components of the inlet system (Figures 2.1, 2.2 and 2.6).

A template (Table 2.2) is used to summarize the overall character of the inlet and the adjacent ebb- and flood-tidal deltas. Ideally a combination of information from a range of sources would be available for this component analysis.

This information then is used in Section 2.4 to link these physical components to the changes in water depth, shoal areas, and currents during the different stages of the tide. The results are summarized in Table 2.3 and Figure 2.9 (which uses a generic inlet system diagram) and can be used to identify appropriate locations within the inlet system where boom and recovery systems can be deployed most effectively.

2.3.1 Charts

1. Use the most detailed scale recent chart that is available to analyze water depth data.

2. To define the morphology of the shoreline and sea bed, draw in black on the chart:

    - the High Water (HW) shoreline: the area above the HW is light yellow on most charts: see Figures B.1, B3 and B.4;

    - the Low Water (LW) shoreline: this is the chart datum: the zone between HW and LW is colored green on most charts (Figure B.1): chart datum in the US is defined as the “mean lower low water” which is typically the Spring Low Tide water level that occurs during the full and new moons ; and

    - any depth contours marked below LW: the contours typically are given in feet, fathoms (1 fathom = 6 feet) or meters, but the unit of depth measurement is in itself not important: on many charts the area between LW and the first depth contour is colored light blue (Figure B.1), but this can vary and there can be more than one shade of blue depending on the scale of the chart.

3. If a graphic scale is not provided on the chart, use the latitude scale on the right or left chart margin.

    - One (1) minute of latitude = 1 nautical mile = 6,076 feet = 1.15 miles = 1852 meters = 1.852 kilometers

    - 10 seconds of latitude = 308 meters or 1013 feet

4. Locate and mark on the chart the six ebb and the six flood tidal delta components shown in Figures 2.2 and 2.6.

5. Document the presence or absence of these components in the template provided below (Section 2.3.4, Table 2.2).

6. Locate and highlight on the chart access or staging areas (e.g. roads, tracks or parking lots).

7. Look up the average and spring tidal range for the location from published tidal predictions ("large" or "spring" tides occur at time of a full and new moon: "average" tides occur 7 days after the full and new moon).

8. If you need to look up the meaning of symbols or abbreviations on a chart refer to: http://www.nauticalcharts.noaa.gov/mcd/chart1/ChartNo1.pdf

9. Review information in the Coastal Pilots: http://www.nauticalcharts.noaa.gov/nsd/cpdownload.htm

Appendix B provides a working example of steps 1 and 4 to define the HW and LW shorelines and the morphological components of an inlet system.

2.3.2 Oblique Aerial Photographs or Video Frames

1. Oblique aerial photographs are sometimes the least valuable images because light reflectance from the water surface can obscure underwater features (see cover photo).

2. Take or use photos during the low tide slack with the sun behind the observer. Figure 2.5 is an oblique photograph taken at low tide so that shoals and channels are easily identified.

3. Try to identify the time the photo or video was taken and compare to the nearest predicted tidal elevation at that time.

4. Locate and mark on the chart the six ebb and the six flood tidal delta features shown in Figures 2.2 and 2.6. Document the presence or absence of these components in the template provided below (Section 2.3.4, Table 2.2).

5. Breaking waves or lines of white caps are a good indicator of shoal patterns (see cover photo and Figures 2.5 and 2.8).

2.3.3 Vertical Photographs or Satellite Images

1. View at the best resolution possible.

2. Try to identify the time the photo or image was taken and compare to the nearest predicted tidal elevation at that time.

3. Locate and mark on the chart the six ebb and the six flood tidal delta features shown in Figures 2.2 and 2.6. See Figure C.1 for an example. Document the presence or absence of these components in the template provided below (Section 2.3.4, Table 2.2).

4. Breaking waves or lines of white caps are a good indicator of shoal patterns (see Figures 2.5 and 2.8).

2.3.4 Template to Define the Physical Character of a Tidal Inlet

Following the steps described above, Table 2.2 may be used as a template to identify which of the physical components are present at an individual inlet. This template is designed as a checklist to provide the basic information to define and describe the physical character of an inlet system. As noted above, not every inlet has the symmetry and character of the generic model shown in Figure 2.1, however, most inlets have most if not all of these components.

The first boxes in the template (A, B and C) are completed based on readily available information on location and tides. The inlet character (Box D) is based on the discussion in Sections 2.2.3 and 2.2.4 and would be entered as a straightforward YES / NO. Similarly the availability of current data would be entered with a reference to the source of that information. "Operational Difficulty" is discussed in Section 3.2 and can be referenced to Table 3.1.

Inlet throat width and depth data (Box E) typically can be measured from nautical charts or estimated from oblique/vertical images. The individual ebb- and flood-tidal delta features listed in Box E are based upon the morphological components defined in Figures 2.2 and 2.6, respectively, and a YES / NO would indicate that component is present/absent and has been identified for the inlet. This identification process is important as changes in water depth and current patterns during the different stages of the tide are closely linked to the morphological features. These schematics indicate the relative location and size of each of the ebb- and flood-tidal delta features, although the actual locations and sizes of these components may vary considerably from one inlet to another, in particular between wave- and tide-dominated environments (see discussion in Sections 2.2.1 and 2.2.2).

Table 2.2. Template to Summarize the Physical Character of a Tidal Inlet

A. Inlet Name					
B. Tidal Range: *(from tidal predictions)*			Average Range	Spring Range

5. Swash Bars			5. Spillover Lobes		
6. Channel Margin Linear Bars			6. Marginal Channels		

2.4 Inlet Features, Water Depth and Currents

One of the most challenging operational aspects of spill response activities at a tidal inlet is to plan for the constant changes in water depth and current flow intensity and direction. Table 2.3 links the morphological components of an inlet system illustrated in Figures 2.2 and 2.6 to typical water depths and current patterns during different stages of the tidal cycle.

The information in Table 2.3 is presented in Figure 2.9 as a set of color-coded schematics using the Legend below. This set of schematics provides critical guidelines for planners and responders in the selection of appropriate locations within the inlet system where boom and recovery systems can be effectively deployed (see Section 4). Operational practicality and feasibility depend to a large degree on water depths and current velocities. Ideally, the water depth would be Moderate or Deep (>1 m or 3 feet) and currents would be Weak or Slack (<0.5 m/s: <1 knot). In the four "Currents" schematics, the presence of breaking waves is considered an overriding factor and this is indicated by the red color code. In this context, the following terms apply for water depth and current patterns during the four primary tidal stages:

Legend for Color Codes in Figure 2.9

DEPTH—Typical Least Water Depth

Deep water: depths typically greater than 2 m (>6 feet)	
Moderate water: depths typically 1-2 m (3-6 feet)	
Shallow water: depths typically less than 1 m (<3 feet)	
Exposed: above the water level (intertidal)	

CURRENTS—Typical Maximum Current

Slack water: little or no current	
Weak: tidal current typically less than 0.5 meter/second (<1 knot)	
Moderate: tidal current typically 0.5 to 1 meter/second (1-2 knots)	
Strong: tidal current typically greater than 1 meter/second (>2 knots)	

WAVES

Zone of breaking waves	

The terms "low tide" and "high tide" refer to the slack-water periods that occur immediately before and after the tide reverses. Each "low" and "high" tide slack-water period lasts for approximately 2 hours. Typical semi-diurnal tides have ebb and flood tide periods on the order of 3 hours, though diurnal tides will run for a 9-hour period. Water depth and current velocity are not the only variables to consider in planning and deployment of equipment, as flow directions also change with the tidal stages, as indicated in Table 2.3.

Table 2.3. Typical Water Depths and Current Patterns at Different Tide Stages

INLET FEATURE	LOW TIDE	FLOODING	HIGH TIDE	EBBING
BAY SIDE: FLOOD DELTA AREA				
1 Flood Ramp	• Shallow to deep water • Slack or weak ebb	• Shallow to deep water • Moderate flood	• Moderate to deep water • Slack or weak flood	• Shallow to deep water • Slack or weak ebb
2 Flood Channels	• Exposed to shallow water • Slack	• Shallow water • Moderate flood	• Moderate water • Slack or weak flood	• Shallow water • Slack or weak ebb
3 Ebb Shield	• Exposed • Slack or weak ebb	• Exposed to shallow water • Slack or weak flood	• Moderate water • Slack or weak flood	• Exposed to shallow water • Strong ebb
4 Ebb Spits	• Exposed to shallow water • Slack or weak ebb	• Shallow water • Moderate or weak flood	• Moderate water • Slack or weak flood	• Shallow water • Strong ebb
5 Spillover Lobes	• Exposed to shallow water • Slack	• Shallow water • Weak flood	• Moderate water • Slack or weak wind-driven flow	• Shallow water • Strong or moderate ebb
6 Marginal Channels	• Moderate to deep water • Slack or weak ebb	• Deep water • Strong or moderate flood	• Deep water • Slack or weak wind-driven flow	• Deep water • Strong ebb
INLET THROAT AREA				
Main Channel	• Deep water • Slack or weak ebb	• Deep water • Strong or moderate flood	• Deep water • Slack or weak flood	• Deep water • Strong ebb
OCEAN SIDE: EBB DELTA AREA				
1 Main Ebb Channel	• Deep water • Moderate ebb or slack	• Deep water • Moderate flood	• Deep water • Slack or weak flood	• Deep water • Strong ebb
2 Marginal Flood Channels	• Shallow water • Slack or weak ebb	• Shallow water • Moderate flood or weak wave-driven flow	• Moderate water • Slack or weak wind-driven flow	• Shallow water • Weak ebb or flood current*
3 Swash Platform	• Shallow water • Slack or weak ebb	• Shallow water • Moderate flood	• Moderate water • Slack or weak wave-driven flood	• Shallow water • Moderate or weak ebb
4 Terminal Lobe	• Moderate to deep water • Slack or weak ebb • Zone of breaking wave action	• Deep water • Moderate flood • Zone of breaking wave action	• Deep water • Slack • Zone of breaking wave action	• Deep water • Moderate ebb • Zone of breaking wave action
5 Swash Bars	• Exposed to shallow water • Slack or weak wave-driven flow	• Shallow water • Moderate or weak flood	• Moderate water • Slack or weak wave-driven flow	• Shallow water • Weak ebb
6 Channel Margin Bars	• Exposed to shallow water • Slack or weak ebb	• Shallow water • Moderate flood	• Moderate water • Slack or weak wave-driven flow	• Shallow water • Moderate ebb

NOTE: During the ebbing tide, flow in the ebb delta marginal flood channels (*) may be towards the inlet if there is a strong outflow through the main channel.

3 Planning Considerations for Oil and Tidal Inlet Systems

Tidal inlets are critical pathways for oil to potentially enter coastal bays and lagoons and to impact tidal flats, wetlands, marshes and mangroves so they are key intercept points to protect these sensitive and vulnerable habitats. Typical oil transport pathways are summarized in Section 3.1. Two key factors in the development of strategic decisions include understanding (a) where and when OPPORTUNITIES may exist for effective, diversion and/or containment and recovery (Section 3.3), and (b) typical operational, logistics and access CONSTRAINTS (Section 3.4).

3.1 Oil Transport Considerations

Three stages of the tide are important for considering OIL TRANSPORT from a slick approaching an inlet:

A. EBB TIDE AND LOW TIDE SLACK.

- During the ebb tide stage, water flows out of the inlet throat until the water levels on the ocean and the lagoon or bay sides are the same.

- This outflow may continue after the low-tide is reached in the ocean, a period lasting for 1 to 2 hours into the early stages of the rising flood tide, and delaying the movement of water into the bay or lagoon.

B. EARLY AND MID FLOODING TIDE.

- During the first half of the flood tide stage, flow into the bay or lagoon is confined to marginal flood channels on both sides of the ebb-tidal delta. Water entering the bay flows around the flood delta shoal (Figure 3.1).

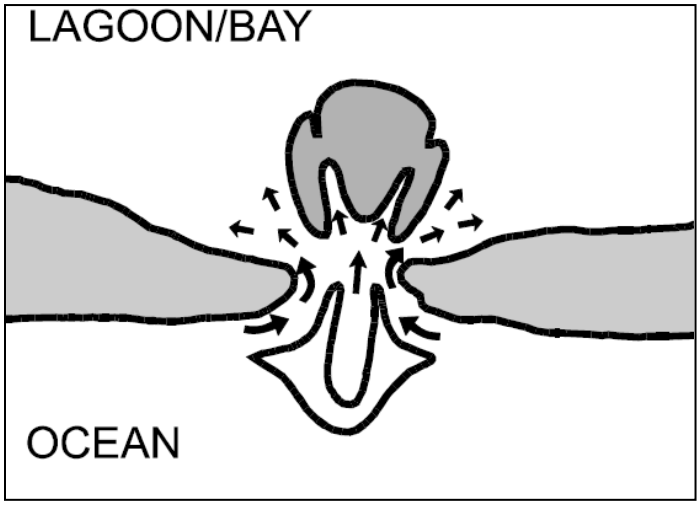

Figure 3.1. Tidal Currents During the Early and Mid-Flood Stage

C. LATE FLOODING TIDE.

- During the second half of the flood tide stage, water levels rise and water flows through the channels and across the ebb-tidal shoal into the inlet. Water entering the bay flows around and over the flood-tidal delta.

- Flood currents are likely to be strongest during the 2-hour period around mid-tide when water levels are still relatively low and flow is largely confined to the marginal channels.

3.2 Inlet Dynamics and Oil Spill Planning

Tidal inlet dynamics present key planning challenges including:

- complex patterns of shoals and channels that are controlled by the balance between wave and tidal forces and bay geometry,

- constantly changing water levels and shoal exposures,

- intertidal areas that are often wide and are alternately exposed and submerged during each tidal cycle,

- potentially high current velocities in channels,

- a reversal of current direction approximately every 6 hours, or every 12 hours if the tides are diurnal, and

- wave-induced currents and breaking waves on ocean-side shoals.

Despite this complexity, most inlets have a similar pattern of shoals and channels that is reflected in the current patterns. Identification of the pattern of the shoals and channels is a key to understanding changes in water depths and flow pattern during different stages of the tide. This does not necessarily make planning or response any easier but provides for understanding when and where (a) opportunities may exist to intercept or control surface oil moving into a bay through an inlet (Section 3.3) and (b) depth and water flow present constraints to effective equipment deployment (Section 3.4).

In general terms, operational difficulty (effectiveness) increases with:

- inlet throat channel width,

- channel depth,

- tidal prism,

- tidal current velocity,

- wave exposure.

These features are listed in Table 3.1, which identifies some of the key overriding regional factors that influence operational difficulty for diversion, containment and recovery systems at inlets.

Table 3.1. Summary of Factors that Affect Operational Difficulty at Tidal Inlets

OPERATIONAL DIFFICULTY	INLET WIDTH	INLET DEPTH	TIDAL PRISM	TIDAL CURRENTS	BACK BAY CHARACTER	WAVE EXPOSURE	PREFERRED FLOOD TIDE TACTICS
Very Difficult: limited potential for success	Wide	Shallow	Large	Strong (>1 knot: 0.5 m/s)	Wetlands	Exposed ocean shore	• Open-water deflection with ocean boom • Bay-side containment or deflection and recovery
Difficult: some potential for success							• Open-water deflection with ocean boom • Bay-side containment or deflection and recovery
Little Difficulty: good potential for success							• Bay-side containment and deflection boom with on water and/or shoreside recovery in channel
Not Difficult: very good potential for success	Narrow	Deep	Small	Weak (<0.5 knot: 0.25 m/s)	Sand beaches	Sheltered ocean shore	• Bay-side containment and deflection boom with on water and/or shoreside recovery in channel • Dams, solid barriers

Difficulty increases as:

- Width
- Depth
- Tidal current
- Tidal prism
- Wave exposure

In the development of a response strategy for oil that threatens an inlet the following are important considerations in the planning and decision process:

- NEARSHORE EXCLUSION STRATEGY.
    - Exclusion strategies are probably impractical and rarely successful once oil reaches an inlet. Dams may be an option for small inlets, time permitting.
    - If the objective is to prevent oil from entering a back bay are then the only likely successful strategy is to prevent oil from approaching and entering the inlet by on-water strategies, such as containment and recovery, diversion, dispersion or controlled burn.
    - The only locations where an exclusion strategy may be effective would be for a narrow inlet with a small tidal prism (the tidal prism is defined “the open-water area of the bay, lagoon or marsh and tidal creek system times the tidal range”) (Table 3.1).
- TIMING.
    - The key periods when response actions potentially can minimize the volume of oil that is transported into a back-bay environment are the Low Tide through High Tide window. In areas with semi-diurnal tides this window may vary from as little as a 6-hour to as much as a 9-hour period, depending on winds and on the size of the tidal prism that has to drain from the bay. With diurnal tides, the window may as much as 12 or 15 hours.
    - The drainage of water from bays with large tidal prisms often continues through the low-tide slack period until the water levels on both sides of the inlet are the same and may delay the onset of the flooding tide for several hours.
    - An ebbing tide will keep oil out of the inlet.

- PRACTICALITY.

    - Flow reversal and the effects that this condition has on anchoring systems is a critical factor in any inlet response. Current reversals typically require redeployment every tidal change, which makes cascading tactics problematic.

    - Two primary variables that affect practicality and effectiveness are water depth and current speed (Section 2.4).

    - Understanding these two latter variables in time and space, as summarized in Figure 2.9), enables planners and responders to avoid locations where depth and current would be constraining factors and to focus attempts to divert, contain or recover surface oil where condition might be more favorable.

3.3 Operational Opportunities: Morphology, Currents and Natural Collection Areas

In terms of OPPORTUNITES for equipment deployment, the locations where exists a combination of depths >1 m (3 feet) and weak or slack currents (<0.5 m/s: <1 knot) typically would be:

- LOW TIDE.

  The main channel in the ebb tidal delta (#1 in Figure 2.2) and the inlet throat have moderate to deep water and the currents are slack (after the outflow from the bay is completed).

- FLOODING TIDE.

  The inlet throat and the marginal channels in the flood tidal delta (#6 in Figure 2.6) have moderate or deep waters, although the currents may be moderate; elsewhere the waters typically are shallow until mid-tide or late in the flood cycle.

- HIGH TIDE.

  Many areas have moderate to deep waters with slack currents, though the bay side usually would be more sheltered from wave action than the ocean side.

Planning for suitable diversion or collection locations involves considering the different spatial features described above within the inlet system as well as looking for quiet or slack water areas along the bay shores. A good example in Figure B.4 (Appendix B) would be The Cove, located behind Beach Point and outlined by the green circle. This area would be a sheltered, slack-water environment with water depths up to 2 m (6 feet) at low tide and at least 1.5 m (5 feet) at all locations at high tide, as this is the mean tide range, with up to 3.5 m (11 feet) in other areas.

Natural collection areas can be identified in the field by debris accumulations. Assuming that floating oil would follow a path similar to floating debris, these zones typically are good indicators of where oil might accumulate naturally and may be useful as collection and recovery sites for oil diverted out of the adjacent channels.

3.4 Operational Constraints: Water Depths, Channels and Accessibility

Understanding changes in water depth, current velocity and flow direction as presented in Figure 2.9 identify “areas of opportunity” but also identify where specific tactics would be CONSTRAINED.

Typically areas to avoid for conventional floating booms and recovery system, in terms of water depth, and therefore access and deployment practicality, and of high current strength, and therefore boom or skimmer effectiveness, would be:

- LOW TIDE.

  Access could be limited and boom deployment, other than shore-seal booms, constrained on the shallow or exposed swash bars and the shallow swash platform on the ebb delta and most of the flood channel, ebb shield and ebb spits on the flood-tidal delta. Breaking waves could limit practicality on the terminal lobe of the ebb delta.

- FLOODING TIDE.

  Shallow areas on the flood channels, ebb shield and ebb spits on the flood-tidal delta could limit access during the first half of the flood. Currents typically are strongest in the inlet throat and the marginal channels of the flood-tidal delta, particularly around mid-tide.

- HIGH TIDE.

  This is the period when access or deployment constraints would at a minimum. Breaking waves could limit practicality on the terminal lobe of the ebb delta.

Notwithstanding these constraints, tactics designed for use in fast currents (see Hanson and Coe, 2001) and equipment such as shore-seal boom can overcome some of these limitations.

3.5 Summary for Planning and Response

The important factor in planning is recognizing where and when opportunities and constraints exist so that decisions can be developed that are realistic and practical. Strategies, such as the diversion of oil from channels into natural collections areas for recovery, or tactics that employ equipment designed for fast-currents, can be developed in the context of understanding changes in water depths, current velocity and flow direction.

From a **tidal cycle perspective**, the main considerations are:

A. LOW TIDE.

   - Sufficient water depth for boom and /or skimmer deployment.

   - Even though water flow may be slack, many areas are shallow or, particularly in the flood tidal delta area, exposed.

   - Flow may continue out of the inlet throat and through the main ebb channel after the predicted low tide until the water levels on the bay and ocean sides are the same.

B. FLOODING TIDE.

- Depths remain shallow in many areas until mid-tide or late in the flood.
- Depth typically should be several times the draft of the equipment.
- Fast-water tactics and equipment should be used in fast currents.
- Flood currents are likely to be strongest during the 2-hour period around mid-tide when water levels are still relatively low and flow is largely confined to the marginal channels.

C. HIGH TIDE.

- Water depths may allow unrestricted access in most area, though some may remain shallow, such as the ebb shield.

D. EBBING TIDE.

- Oil on the water would be carried seawards out of the inlet system.

From a **geographic perspective**, there are three key physical environments of a tidal inlet in terms of OIL SPILL RESPONSE:

1. The WAVE-DOMINATED open ocean waters and shorelines.

   - Primary limitations on oil containment and recovery are related to a combination of breaking waves in shallow waters around the ebb tidal delta and tide currents in the channels.
   - During the initial stage of a flooding tide, oil on the ocean side of an inlet only would be transported into the inlet throat through one or both of the marginal flood channels until the bay has fully drained.
   - Strategic options include:
     - deflecting oil away from the inlet throat for on-water recover, and/or
     - diversion booming to direct oil to a beach for recovery (Figure 3.2).
   - Flood currents are likely to be strongest during the 2-hour period around mid-tide when water levels are still relatively low and flow is largely confined to the marginal channels.
   - During a flood tide, after the ebb flow ceases, *control and recovery of oil is more likely to be successful on the bay side of an inlet* where the waters are sheltered from wave action (see below).

2. The CURRENT-DOMINATED inlet throat.

   - As the water level in the ocean rises, flood waters enter the inlet along the marginal channels even as ebb currents continue to flow in the center of the channel.

- As soon as the outflow from the ebbing tide ceases, oil could be transported into the bay or lagoon by the relatively strong flood tide.

- Diversion to shore may be possible but *control and recovery of oil is more likely to be successful on the bay side of an inlet* where the current velocities are lower.

3. The WAVE-SHELTERED waters and shorelines of the bay or lagoon.

    - Primary limitations are strong flood tide currents in channels.

    - During the first stages of a flood tide, after the ebb drainage ceases in the inlet throat, the flood tide would carry oil in the channels around the flood tidal delta.

    - Flood currents are likely to be strongest during the 2-hour period after mid tide when flow is largely confined to the marginal channels.

    - During the late stages of a flooding tide the incoming waters would flow over most of the flood tidal delta.

    - Strategic options include:

        o Diversion booming to direct oil to a beach for recovery in the flood channels in the sheltered side of the inlet (Figure 3.2).

(a) (b)

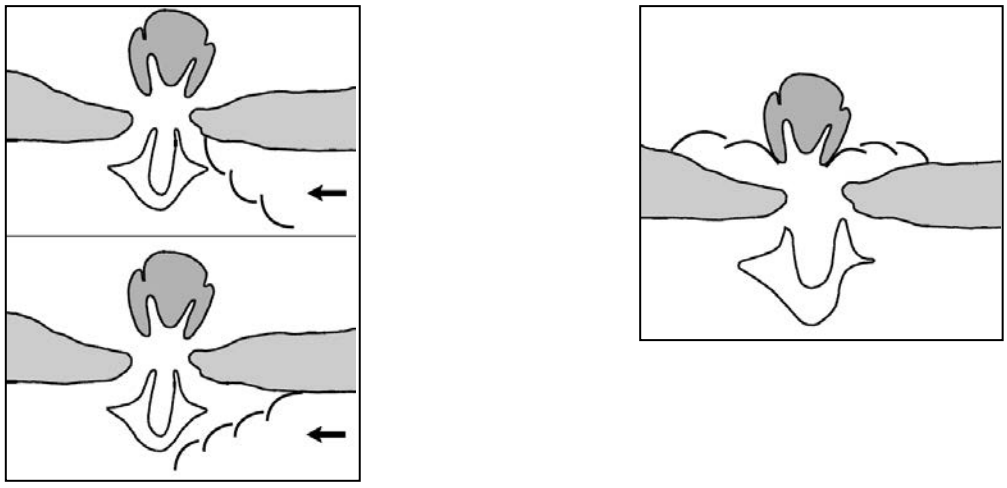

Figure 3.2. Booming Options During a Flooding Tide: (a) Diversion Towards Shore Updrift of the Inlet with Recovery on the Beach (top) or Deflection Away from the Inlet with On-Water Recovery (bottom); (b) Diversion Towards Shore in the Flood Channels and Recovery on the Beach

4 Tidal Inlet Protection Strategy ("TIPS") Selection Guide

4.1 Generic Strategies

Tidal Inlets present complex, dynamic and challenging environments for oil spill control. Challenges include high current velocities, changing tidal directions, shallow (or no water), swells, surges and breaking waves, and restricted shoreline access. As a result of these and other factors, attempts to protect tidal Inlets commonly have met with marginal success. This lack of success may have been influenced by a lack of understanding of inlet dynamics and lack of equipment suited to conditions prevalent in tidal inlets. HOWEVER, with an understanding of tidal inlet characteristics and processes AND an understanding of the applications and limitations of oil spill control technology, strategies CAN BE SUCCESSFULLY IMPLEMENTED within inlet systems in many cases to protect sensitive back-bay resources.

Conventional strategies for protection and control of oil spills threatening tidal inlets include:

- Prevention of Oil from entering the Inlet.
    - Physical treatment or containment/recovery of floating oil offshore before it reaches the tidal inlet (Note: offshore mechanical recovery, dispersant application and burning strategies are outside the scope of this study.
    - Physical exclusion of oil from the inlet by exclusion booming.
    - Redirection of oil moving alongshore by deflection booming around the inlet.
    - Closure of the inlet by construction of temporary dams or other physical barriers.
- Control Actions Within the Tidal Inlet System (Inlet Throat, Ebb and Flood Deltas).
    - Exclusion and deflection away from sensitive features or toward locations where control and recovery is feasible.
    - Diversion of oil to shorelines where control and recovery is feasible.
    - On water oil recovery.
- Control Actions within the Interior Back Bay and Lagoon.
    - Exclusion of floating oil from sensitive areas by booming.
    - Containment and recovery of oil in quiet water.

The selection and implementation of response strategies must recognize that the characteristics of tidal Inlets are highly variable and that the generic strategies are subject to inclement weather and oceanographic conditions, availability of appropriate equipment and trained response personnel, and other often unknown factors, and may not always be effective, practical, or safe. The strategic options, including advantages and limitations, are summarized in Table 4.1. Because of the complexity and variability of tidal inlets, the strategies presented may not include all possible options. Guidance provided herein should not preclude consideration of other options and should not replace the use of common sense.

Table 4.1. Summary of Strategic Options

STRATEGY	ADVANTAGES	LIMITATIONS	COMMENTS
Offshore on-water mechanical recovery, controlled burning, and dispersant application	Prevents oil reaching an inlet	Typically cannot recover or eliminate 100% of the oil	Guidance regarding offshore mechanical recovery, controlled burning and dispersant application are outside the scope of this study
Ocean-side exclusion booming	Prevents oil reaching an inlet	Feasibility and practicality decrease as inlet size, wave height and current velocity increase	Potential option for small inlets in relatively calm conditions
Ocean-side booms redirect oil toward the shore and/or away from the inlet for recovery	Prevents oil entering the main channel	Strong currents and/or breaking waves	Would likely require cascading booms in a difficult operating environment
Inshore mechanical recovery	Removes oil from further penetration into tidal inlet	Strong currents, tidally varying depths, and breaking waves	Fast water and underway skimmer required
Bay-side booms redirect oil toward the shore and/or away from the inlet for recovery	Sheltered wave environments	Strong current in inlet throat could entrain oil so some portion may enter bay subsurface	Potential effectiveness decreases with rising tide as oil can flow over central shoal
Dams to close surface flow through an inlet	Effective barrier	Window of opportunity before oil reaches inlet	Potential option for small inlets in relatively calm conditions. Would require underflow pipes to maintain circulation
Protection and containment booms and barriers	Prevents oil from reaching sensitive areas	Limited to low current velocity areas , water depth requirements	Anchoring may be critical. Consider use of driven piles for anchoring.
Pile driven boom anchoring system	Provides stable anchoring in high current flow	Window of opportunity. Would require sliding bridles to adjust to changing water levels and maintenance for reversing currents	Little flexibility
Air bubble barriers	Effective for surface and submerged oil. Unaffected by changes in flow direction of water level changes	Window of opportunity for installation	

Prespill field examination of specific tidal inlets is highly recommended for development of planning strategies. Field observations should include:

- Observations during low tide, and high flow conditions;
- Identification of (a) shoreline access points (preferably vehicular) to facilitate deployment, oil recovery and storage, and demobilization, (b) limitations to access, and (c) potential access improvements;
- Visual verification of current velocities and direction (at peak flood). Flow direction can be identified by tracking floating objects, such as oranges, and velocity by measuring the time required for a floating object to traverse a measured distance (these procedures have been used successfully for tidal inlet planning since at least the early 1970's);
- Locations of shoreline debris accumulations as these are representative of natural floating debris accumulation and are likely points of accumulation for spilled oil; and
- Types and locations of existing anchoring points. Shoreline anchor points include any large fixed objects to which booms can be attached. In water anchoring points include bridges, pilings and other rigid structures. Existing anchoring points can be critical in tidal inlets for fast deployment and positive anchoring.

These observations should be noted on charts, satellite photos, etc. and evaluated spatially in conjunction with tactical guidance (following discussion). Overlaps are usually indicative of preferred strategic and tactical action sites.

Drills, exercises and verification of Geographic Response Plans (GRPs) that test response strategies and tactics are useful to verify the feasibility and effectiveness of the selected option(s).

4.2 Candidate TIPS Selection Guide

A Guide for the selection of candidate strategies based on the components of a generic tidal inlet during a flooding tide, when oil would be moving through the system towards a back-bay or lagoon environment, is presented in Figure 4.1. This Selection Guide is designed for the identification of those tidal inlet system components where various strategies may be feasible, based in part on the water depths and current characteristics as described in Table 2.3 and Figure 2.9. The Guide is organized by tidal system component features and provides summary information on minimum water depths, maximum current velocities, and probable presence of breaking waves. The Guide also identifies potential strategic options where appropriate for generic types of actions (on-water containment, exclusion/deflection booming, deflection to shorelines (for recovery), on water recovery, and shoreline recovery. Strategies are intended for the control and recovery of surface oil and do not address subsequent cleanup at the shoreline.

Multiple strategic options are identified for basic tidal inlet features. It is important to note that no strategic options are identified for a number of features which are located over most of the in the ebb delta (ocean side) as no functional tactics exist or are considered safe for these areas.

It is recommended that field observations accompany the use of this table in response planning. Testing of candidate strategies/tactics through drills and exercises is also recommended. Ultimately, however, successful implementation of each strategy/tactic is dependent on case-specific conditions.

Location	Inlet Feature	Water Depth Minimum (m)		Current Velocity Maximum (knot)		Breaking Waves	Strategy (Flood Tide)				
							Open Water Containment	Exclusion / Deflection	Divert to Shore	Recovery	
		Ebb Tide	Flood Tide	Ebb Tide	Flood Tide					On Water	Shoreline
Back Bay (Lagoon)		Shallow	Moderate	Weak	Weak	N	X	X	X	X	X
Bay-Side (Flood Delta)	1. Flood Ramp	Shallow	Moderate	Weak	Moderate	Y		X			
	2. Flood Channels	Exposed	Moderate	Weak	Moderate	Y		X			
	3. Ebb Shield	Exposed	Moderate	Strong	Weak	N		X			
	4. Ebb Spits	Exposed	Moderate	Strong	Moderate	N		X		-	
	5. Spillover Lobes	Exposed	Moderate	Strong	Moderate	N		X		-	
	6. Marginal Channels	Moderate	Deep	Strong	Strong	N		X	X	X	X
Inlet Throat		Deep	Deep	Strong	Strong	N		X	X	X	X
Ocean Side (Ebb Delta)	1. Main Ebb Channel	Deep	Deep	Strong	Moderate	N			X	X	
	2. Marginal Flood Channels	Shallow	Moderate	Weak	Moderate	Y			X	X	X
	3. Swash Platform	Shallow	Moderate	Weak	Moderate	Y					
	4. Terminal Lobes	Deep	Deep	Moderate	Moderate	Y					
	5. Swash Bars	Shallow	Moderate	Moderate	Moderate	Y					
	6. Channel Margin Bars	Exposed	Moderate	Moderate	Moderate	Y					
Coastal (Ocean)		Deep	Deep	Weak	Weak	N	X	X	X	X	X

Figure 4.1. Tidal Inlet Protection Strategy (TIPS) Candidate Selection Guide for All Tide Stages

X — Strategy may be feasible, depending on site conditions

Strategy unlikely to be feasible

4.3 Strategies and Tactical Options

4.3.1 Strategies versus Tactics

The strategies identified in Figure 4.1 cannot be implemented without workable tactics and appropriate equipment. It is essential for planners to understand that, due to the complexity and variability of oil spill threatening tidal inlets, strategies and respective tactics may be difficult or impractical to implement in many cases. In addition, specialized equipment, such as “fast-water” booms and skimmers may be required. (Note: It is not the intention of this report to provide instructions on tactical deployment and equipment operation).

4.3.2 Tactical “Rules of Thumb”

Selection of practical TIPS should include an evaluation of whether tactics and equipment are appropriate and available for their implementation. Failure to consider to these rules is likely to contribute to an unsuccessful protection operation. The following Rules of Thumb are based on past field experience and should always be considered in evaluating the practicality of candidate TIPS:

a) **Not all conventional response equipment may perform adequately in the open coastline / tidal inlet environments**. The implementation of TIPS strategies and tactics may require specialized equipment (i.e. fast-current equipment) and highly trained or experienced responders;

b) **Tactics which rely on equipment which must float require a minimum water depth greater than the draft of the equipment**. Some equipment, particularly booms, require additional depth to relieve the excess pressure built up by the presence in the water of the device itself;

c) **Tactics and equipment must be suitable for reversing flow (tidal) environments**. Typically, setting anchors and maintaining their position is difficult in reversing flow situations, and in many situations complete redeployment and/or continual readjustment every tidal cycle is necessary. The use of existing fixed anchoring points is recommended, where practical, such as may be available on bridge supports or other man-made structures;

d) **Strategies involving on-water containment or diversion to a containment area MUST include provisions to recover the impounded oil**. Oil not collected immediately is subject to re-mobilization associated with high flow entrainment or other forms of containment failure, or by tidal reversals;

e) **Diversion strategies require precise boom configurations**. If configurations are allowed to bow, they become containments which are likely to fail in high flow situations. Diversion strategies typically require continual monitoring and adjustment;

f) **Recovery operations require on-water or shoreline storage capable of accommodating the combined output from all concurrent skimming operations**. Skimmers cannot continue to operate if there is insufficient storage capacity for the recovered fluids, that is, both oil AND entrained water;

g) **Implementation of most TIPS may be constrained by time and manpower requirements**. The ability to deploy/redeploy equipment must match the tidal windows. Sufficient manpower (sometimes dedicated) must be available;

h) **Responders should be familiar with each inlet.** Tactics are best conducted by responders familiar with the area and trained specifically in the implementation of the planned strategies. Drills and exercises for individual inlets are recommended.

4.3.3 Tactical Guidance Summaries

The following fourteen Tactical Guidance Summaries provide a variety of guidance information to assist in the planning and selection of strategic/tactical options. These guidelines are based in part on the water depths and currents presented in Figure 2.9.

Tactical Guidance Summaries (*with appropriate operating locations in italics*) include:

On-Water Containment

- Containment Booming (Figure 4.3.1): *Open Ocean, Back Bay, Lagoon*

Exclusion / Deflection

- Exclusion and Deflection Booming (Figure 4.3.2): *Ocean, Ebb Delta, Inlet Throat*
- Tidal System Exclusion (Dams, Tide Gates, and Weirs) (Figure 4.3.3): *Inlet Throat, Back Bay*

- Deflection Around Man-made Structures (Figure 4.3.4*): Inlet Throat, Flood Delta, Back Bay*
- Exclusion Booming (Figure 4.3.5): *Flood Delta, Back Bay*
- Deflection (Figure 4.3.6): *Flood Delta, Back Bay*

Divert To Shore

- Diversion Booming (Figure 4.3.7): *Flood and Ebb Deltas, Inlet Throat*
- Chevron Diversion Booming (Figure 4.3.8): *Ebb Delta. Inlet Throat*
- Cascading Diversion Booming (Figure 4.3.9): *Flood and Ebb Deltas, Inlet Throat*
- Boom Vanes and Rudders (Figure 4.3.10): *Flood and Ebb Deltas, Inlet Throat*
- Air Curtain Diversion (Figure 4.3.11): *Flood Delta, Inlet Throat, Back Bay*

Recovery

- On-Water Recovery (Figure 4.3.12): *Ocean, Flood and Ebb Deltas, Inlet Throat, Back Bay*
- Berms, Trenches, Pump/Vacuum (Figure 4.3.13): *Flood and Ebb Deltas, Back Bay*
- Sorbents (Figure 4.3.14): *Flood and Ebb Deltas, Inlet Throat, Back Bay*

The Tactical Guidance Summaries include the following information:

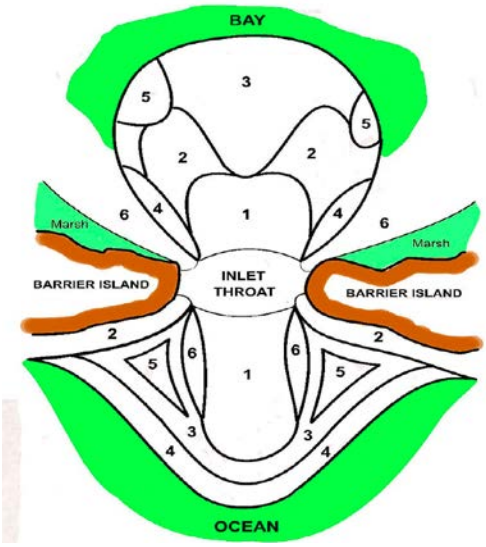
- A Generic Tidal Inlet System schematic showing locations where tactical operations for specific inlet components are typically feasible (**green shading**) and where tactics may be feasible under special circumstances (**yellow shading**). The morphological components follow those defined in Figures 2.2 and 2.6 and Table 2.3. Appendix A provides instructions on how to locate inlet-specific morphologic features.
- Objective of the Tactic.
- Representative photographs for typical deployments.
- Specialized equipment requirements as appropriate.
- Limitations on the implementation of the tactic.
- General operating requirements.

4.3.1	**ON WATER CONTAINMENT**
	CONTAINMENT BOOMING: *OCEAN, BACK BAY, LAGOON*

Open Ocean

Back Bay

Location



Equipment:

- High freeboard boom (Offshore).
- Smaller boom (Inshore).
- Boom handling vessels.
- Oil recovery capability.

Objective

- Deploy (1) open water boom on the seaward side of the Ocean-Side Ebb Delta to contain oil and prevent it from entering the Tidal Inlet System; (2) inshore boom for back bay / lagoon containment.

Limitations:

- High winds, swell, and breaking waves may preclude use of this tactic from safety as well as operational aspects.
- Complete containment unlikely in either case.

Operating Requirements

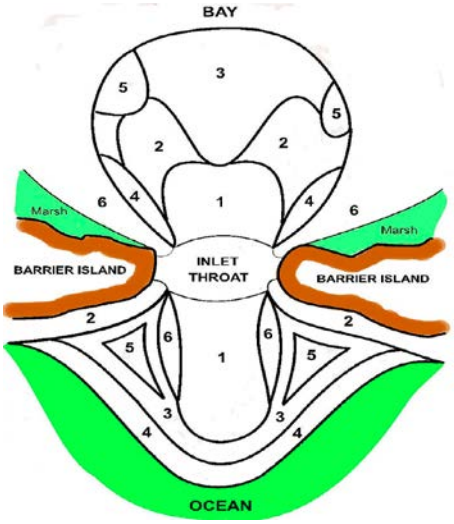
- Manned deployment—extensive marine resources may be required offshore.
- Oil impounded must be recovered immediately—skimming and offloading resources required.

4.3.2	EXCLUSION and DEFLECTION
	EXCLUSION and DEFLECTION BOOMING: *OCEAN, EBB DELTA, INLET THROAT*

Exclusion Boom

Deflection Boom

Location



Equipment

- Offshore skirt boom.
- Tidal seal boom.
- Offshore anchoring systems.
- Deployment vessels.
- Warning markers/lights.

Objectives

- Exclusion: Completely boom off tidal Inlet (seaward of ebb delta). Shore termination required on both sides of boom.
- Diversion (For oil moving inshore and along coastline); Deflect oil moving along the shoreline seaward allowing it to pass inlet flood tide zone.

Limitations

- Inclement weather and sea conditions; operational and safety issues.
- Booming is likely to be ineffective with breaking waves.
- Contained oil must be removed immediately to prevent loss.
- May interfere with inlet navigation.

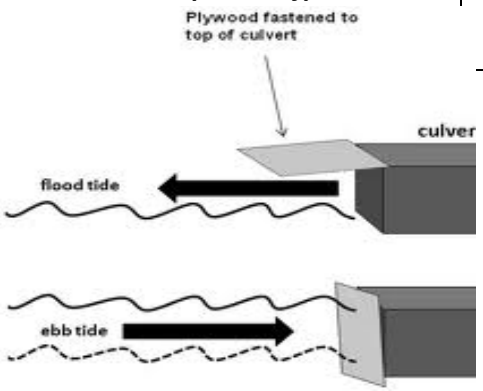
Operating Requirements

- Full time monitoring / boom adjustment team required.
- Oil recovery and storage resources required (on water and onshore).
- Booms and anchors may require removal during inclement weather.

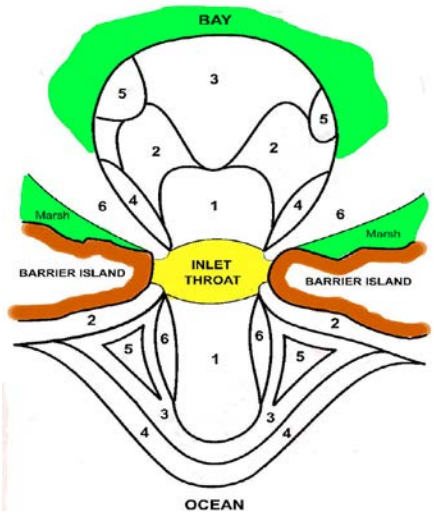
4.3.3	EXCLUSION and DEFLECTION
	TIDAL SYSTEM EXCLUSION (Dams, Tide Gates, Weirs): *INLET THROAT, BACK BAY*

Exclusion Dam (Tidal Inlet)

Exclusion Barrier with Weir or Tidal Gate (Back Bay)



Location



Equipment:

- Tracked earthmoving equipment.
- Tidal Gates / materials.
- Warning buoys / lights.

Objectives

- Construct physical barrier to prevent oil from entering (1) inlet or (2) back bay or lagoon channels.

Limitations

- May be difficult to construct in inlets having large tidal prism.
- Permitting/Construction may require extended (and unacceptable) periods of time.
- May result in unacceptable interference with tidal flushing or other environmental problems.
- May interfere with navigation.

Operating Requirements

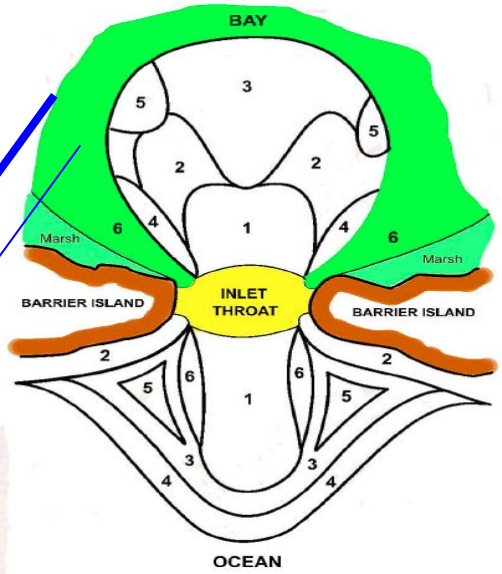
- Minimal once constructed; Weirs / tide gates may require operation if so equipped.
- Construct will require removal and restoration on completion of use.

4.3.4	EXCLUSION and DEFLECTION
	DEFLECTION BOOMING AROUND MANMADE STRUCTURES: *INLET THROAT, FLOOD DELTA, BACK BAY*

(a) Boom along armored tidal inlet

(b) Inlet deflection

Location



Equipment

- Most boom types can be used.
- Fenders to hold boom off shore.
- Flow reversing anchor systems or driven piles.

Objectives

- Install boom along rip rap or bulkhead face to bypass oil to quieter area for control and recovery (oil in rip rap or behind bulkheads is difficult to remove and can result in long term discharge.

Limitations

- Boom should be installed to stay seaward and as parallel to current flow/shoreline as possible.
- Sufficient minimum water depth to float boom.

Operating Requirements

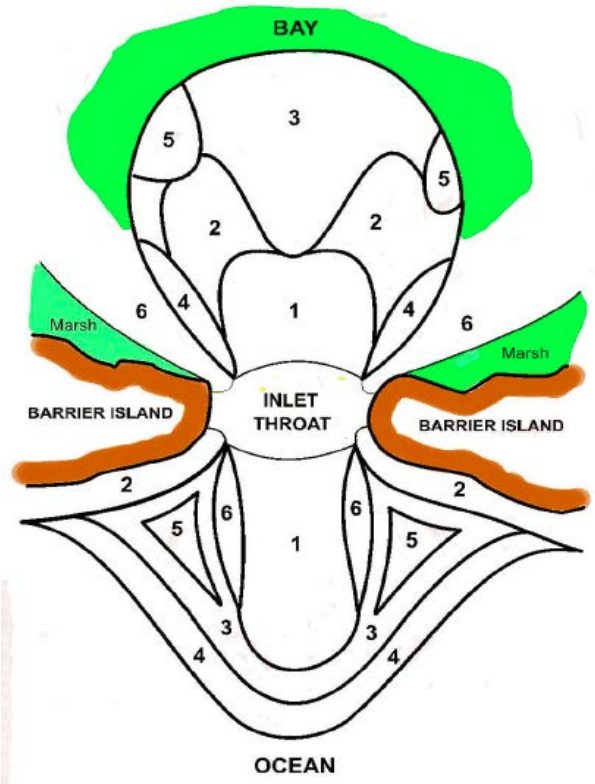
- Periodic monitoring and maintenance required.
- Sorbent (boom or snare sweep) can be placed between boom and feature.

4.3.5	**EXCLUSION and DEFLECTION**
	EXCLUSION BOOMING: *FLOOD DELTA, BACK BAY*

(a) Creek mouth exclusion

(b) Back bay wetland exclusion

Location



Equipment:

- Most inshore boom suitable.
- Reversing flow anchoring system or driven piles may be required.

Objectives

- Prevent oil from entering bay and lagoon side channels.

Limitations

- Minimum water depth should be several times the draft of the boom used.

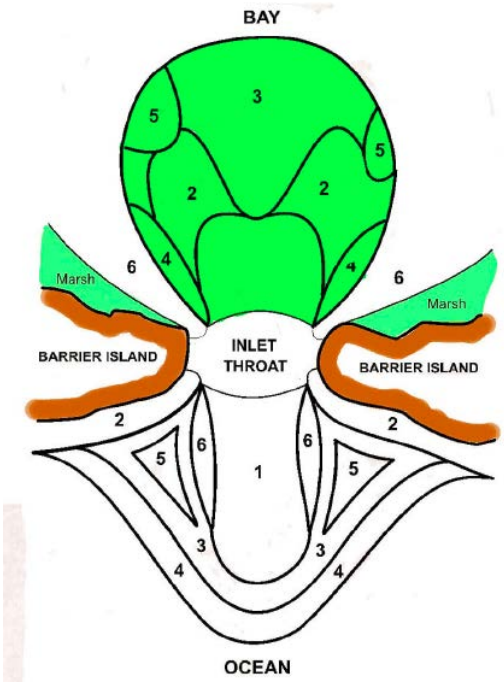
Operating Requirements

- Periodic monitoring and maintenance required.
- Periodic removal of any impounded oil and debris required.
- Boom will require demobilization in the event of deteriorating weather and sea conditions.

4.3.6	EXCLUSION and DEFLECTION
	DEFLECTION BOOMING: *FLOOD DELTA, BACK BAY*

Tidal Boom flood shield deflection

Location



Equipment

- Tidal seal boom.
- Multi-directional anchors, driven piles or screw anchors.

Objectives

- Deflect oil reaching ebb delta ramp and shield away from bay back and lagoon and toward marginal side channels for control and recovery.

Limitations

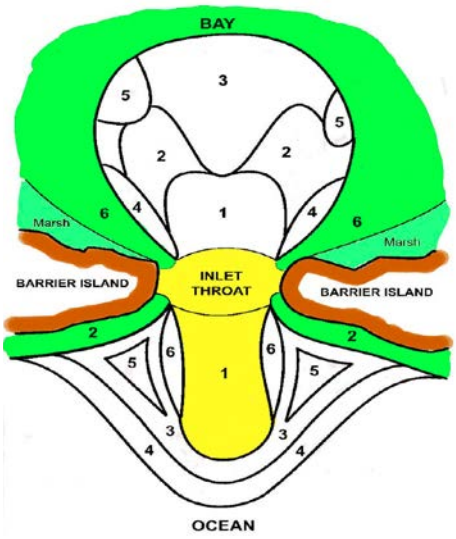
- Booms are difficult to move once deployed.

Operating Requirements

- Booms should be placed to direct floating oil away from back bay / lagoon and toward marginal channels.
- Maintenance of boom position may be difficult. Monitoring and redeployment may be required in response to any changes in local conditions.
- Boom may require demobilization in the event of deteriorating weather and sea conditions.

4.3.7	**DIVERT TO SHORE**
	DIVERSION BOOMING: *FLOOD and EBB DELTAS, INLET THROAT*

Location



Equipment

- Interior Shorelines: Fast Water class boom preferred (shallow weighted skirt, bottom tensioned).
- Fast water multidirectional anchor systems or driven piles.
- Deployment boats.

Objectives

- Deploy fast water class boom in single catenary to divert oil to shoreline for recovery.

Limitations

- Minimum water depth should be deeper than draft of boom (suggest at least 3x).
- Anchors may drag on sand bottoms in high flow areas or when tides reverse, requiring redeployment.
- Provisions must be included to remove any oil impounded as it is collected. Vehicle access to boom apex recommended.

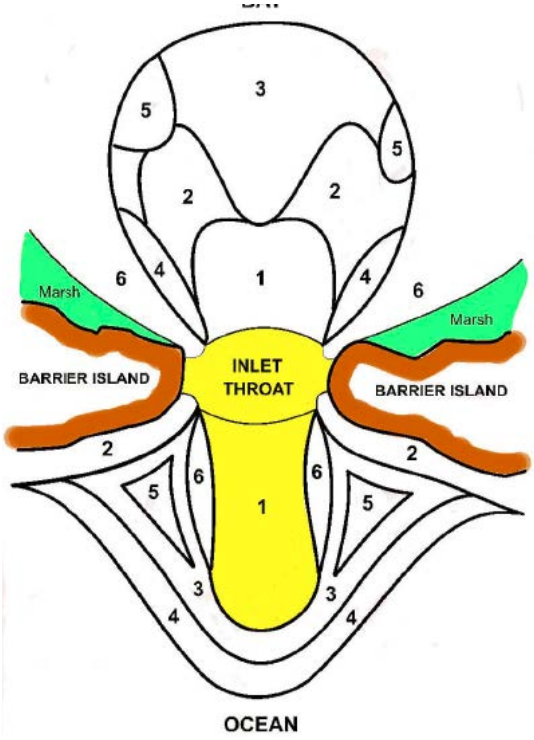
Operating Requirements

- Fast water and tidal anchoring tactics required (high maintenance and manpower requirement) High deployment angles are typically necessary and installation must be tight enough to direct oil all the way to the shoreline (Oil caught in bows in boom will be subject loss by entrainment under boom).
- Multiple (redundant) deployments generally recommended.
- Can be deployed using boom vanes (Fig. 4.3.10). Boom will require demobilization in the event of deteriorating weather and sea conditions.

4.3.8	DIVERT TO SHORE
	CHEVRON DIVERSION BOOMING: *EBB DELTA, INLET THROAT*

Closed chevron

Location



Equipment

- Fast water boom.
- Fast water multidirectional anchor systems or driven piles.
- Deployment Vessels.
- Warning/Navigation Lights.

Objectives

- Deploy boom in the inlet throat to direct floating oil toward Barrier Islands or fast water skimmers for recovery.

Limitations

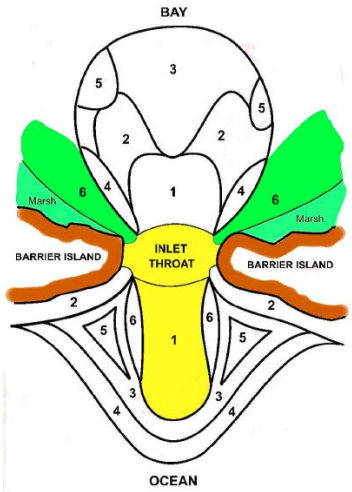
- Minimum water depth should be deeper than draft of boom (suggest at least 3x).
- Anchors may drag on sand bottoms in high flow areas or when tides reverse, requiring redeployment.
- Boom may fail in presence of breaking waves.
- Deployment may interfere with navigation.

Operating Requirements

- Monitoring and redeployment may be required.
- Deployment is for deflection. Boom should not be allowed to impound oil.
- Boom will require demobilization in the event of deteriorating weather and sea conditions.

4.3.9	**DIVERT TO SHORE**
	CASCADING DIVERSION BOOMS: *FLOOD and EBB DELTAS, INLET THROAT*

Location



Equipment

- Fast water class boom.
- Fast water multidirectional anchor systems or driven piles.
- Oil recovery and storage capability.
- Deployment and tending vessels.

Objectives

- Direct floating oil to shoreline in high current areas for recovery.

Limitations

- Minimum water depth should be deeper than draft of boom (suggest at least 3x).
- Anchors may drag on sand bottoms in high flow areas or when tides reverse, requiring redeployment.
- Rapid deployment and maintenance of boom position may be difficult, particularly in tidal situations.
- Longer deployment time requirements than other diversion systems.
- Boom may fail in presence of breaking waves.

Operating Requirements

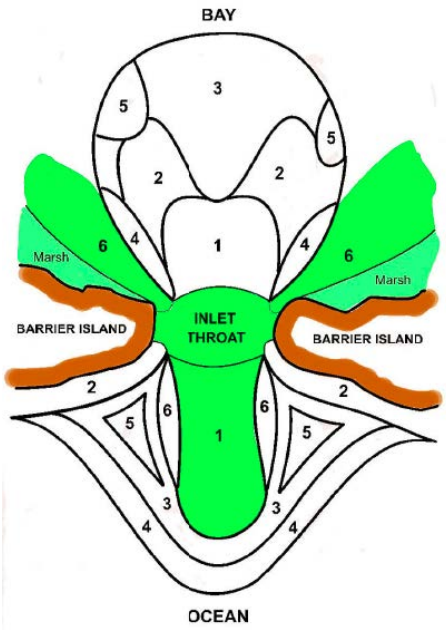
- Significant monitoring and redeployment may be required in response to any changes in local currents or wave approach direction. Not designed to contain oil.
- Boom will require demobilization in the event of deteriorating weather and sea conditions.

4.3.10	DIVERT TO SHORE
	BOOM VANES AND RUDDERS: *FLOOD and EBB DELTAS, INLET THROAT*

(a) Boom Vanes

(b) Boom Rudders

Location



Equipment

- Fast water class boom.
- Large and small boom vanes.
- Boom rudders.

Objectives

- Attach to fast water boom to rapidly deploy boom and maintain shape without anchors or vessels.

Limitations

- Minimum current of 1.5 knots required for deployment—not useable at lower velocity.
- Vane must float above bottom. (Suggest minimum depth of 3 feet (1 m) for small vane and 12 inch (0.3 m) skirt boom.
- Can deploy to only limited distances from shoreline.
- Vanes must be redeployed at every tidal reversal.

Operating Requirements

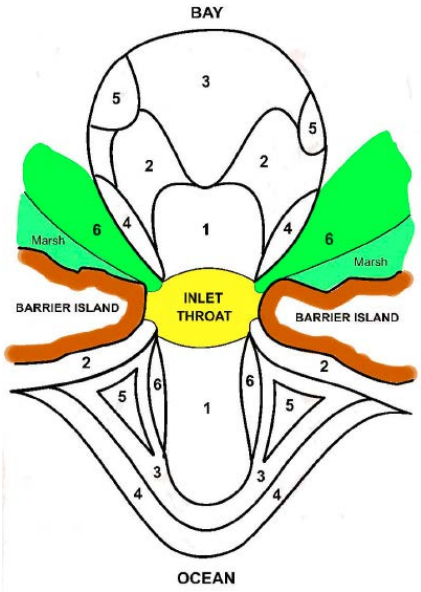
- Constant monitoring and redeployment crew required.
- Must have shoreline connection (Tidal seal boom, buried boom skirt, etc.).
- Contained oil must be recovered continually or boom drainage will occur.

4.3.11	**DIVERT TO SHORE**
	AIR CURTAIN DIVERSION: *FLOOD DELTA, INLET THROAT, BACK BAY*

(a) Prototype floating air curtain

(b) Air barrier

Location



Equipment

- Large portable compressors.
- Perforated pipe, hose, valves and anchors.
- Oil recovery sand storage equipment.

Objectives

- Flow of air from sunken pipe is used to create a diverging surface flow which presents a barrier to floating oil. Use to divert floating oil to shoreline for recovery.

Limitations

- Effectiveness diminishes at velocities above 1.5 knots.
- Requires minimum water depth > several meters.
- Require large compressors and shoreline access.
- Perforated pipe may be difficult to anchor or reposition in high currents.

Operating Requirements

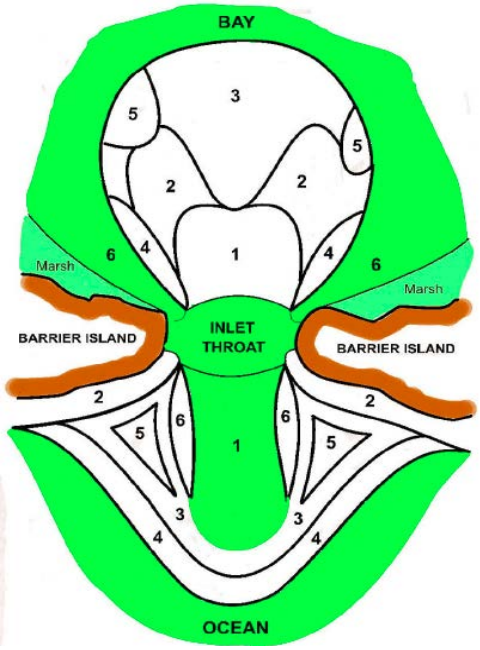
- Requires full-time operating personnel and monitoring.
- Submerged pipe and anchors require removal after use.

4.3.12	RECOVERY TACTICS
	ON-WATER RECOVERY: *OCEAN, FLOOD and EBB DELTAS, INLET THROAT, BACK BAY*

a) Fast Water (NOFI)

b) Vacuums—Vacuum Truck

Location



Equipment

- Advancing/ offshore class skimmers.
- Fast Water Skimmers (high flow areas).
- Conventional skimmers (onshore).
- Support Vessels.
- Onsite storage capability.

Objectives

- Use vessel operated advancing or stationary skimming systems to recover oil contained offshore.
- Use anchored advancing or fast water skimmers to recovery oil in high current areas.
- Use fast water or conventional skimmers and vacuum trucks to recover oil contained along shorelines.

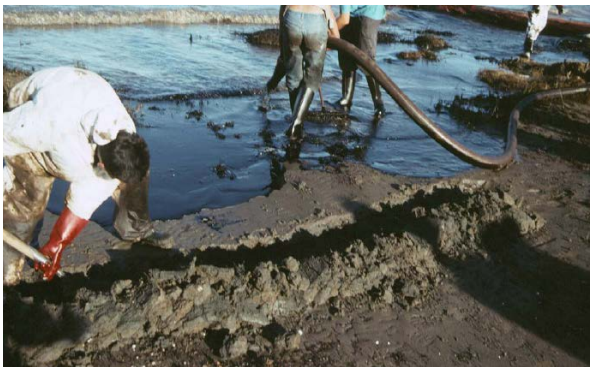
Limitations

- Sufficient depth to float skimming device.
- Skimming effectiveness is likely to be ineffective with breaking waves.

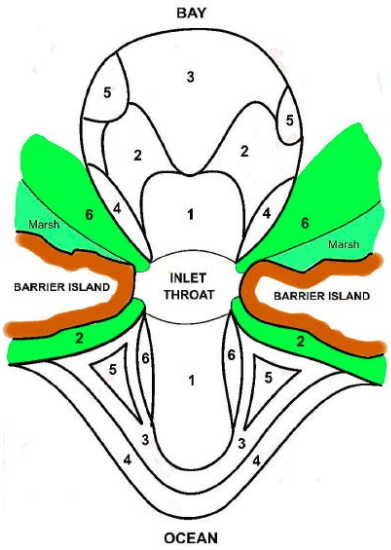
Operating Requirements

- Requires full time operating personnel.
- Adequate storage capacity must be provided to maintain skimming.

4.3.13	**RECOVERY**
	BERMS, TRENCHES and PUMP/VACUUM: *FLOOD and EBB DELTAS, BACK BAY SHORELINES*



Location



Equipment

- Manual or mechanized excavating equipment.
- Oil recovery / storage capability.

Objectives

- Construct pie across mid/upper intertidal zone to collect incoming oil. Pit may be connected to sand berm extending into water, or to diversion boom. Most useful where oil is moving along shoreline or diverted to shore.

Limitations

- May be difficult to keep pit open (caving of sides or infilling).
- Oil may be buried as pits fill in.
- Mechanized access to shoreline preferred.

Operating Requirements

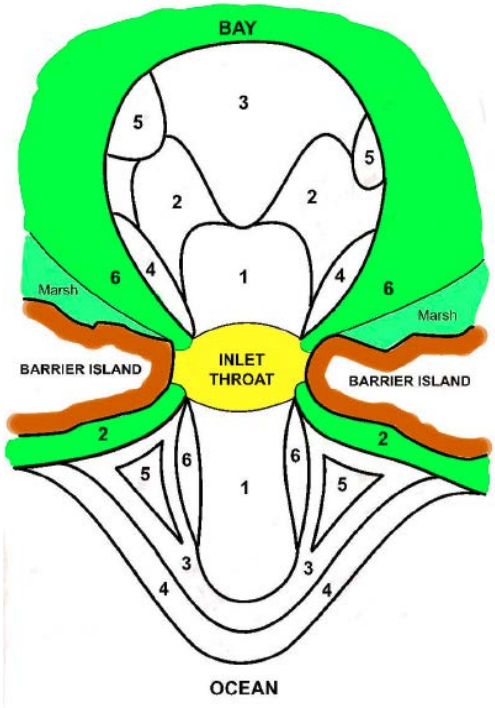
- Locations of all excavations must be accurately located and/or marked.
- Monitoring and recovery of collected material must be conducted periodically.
- Removal of all oil in pit sediments will be required during demobilization / restoration.

4.3.14	RECOVERY
	SORBENTS: *FLOOD and EBB DELTAS, INLET THROAT, BACK BAY*

Anchored sweeps—shallow, intertidal

Boom gaps

Location



Equipment

- Stock of sorbents.
- Spent sorbent bags / bins.
- Screw sand anchors.

Objectives

- Sorbent sweeps can be attached to shallow and exposed sand bars to collect lighter amounts of floating oil.
- Sorbents can be used to back booms and plug boom gaps at shorelines.

Limitations

- Relatively calm conditions required.
- Anchoring sweeps may be difficult in exposed locations.

Operating Requirements

- Monitoring, repositioning and change out of sorbents required.
- Spent sorbents should be bagged and removed regularly.

Appendix A

User Guide Checklists

A.1 User Guide for Prespill Planning Appendix

1. RECOGNIZE INLET FEATURES.

    a. Use the generic model of an inlet system (Figures 2.1, 2.2 and 2.6) and the steps listed in Section 2.3.4 to identify the component features of the inlet.

    b. Complete the template presented in Table 2.2.

    c. Bear in mind that not every inlet has the symmetry and character of the generic model shown in Figure 2.1.

2. UNDERSTAND THE DYNAMICS OF AN INLET SYSTEM.

    a. After the components have been identified, read Section 2.2 that describes some of the key processes that operate in the different parts of the inlet system.

    b. Consult Table 2.3 and Figure 2.9 which present the same information in tabular and graphic forms respectively, to understand how water depth and current patterns change for each of the component features as the tidal waters ebb and flood.

    c. Consult Sections 3.1 and 3.2 for descriptions of how oil moves through an inlet system on a flood tide.

    d. Read Sections 3.3 and 3.4 to identify some of the operational opportunities and constraints that are typical of inlet systems.

3. SELECT RESPONSE STRATEGIES AND TACTICS.

    a. Consult Section 4.1 to develop a regional response strategy that includes containment and recovery or elimination of the oil before it reaches the inlet area.

    b. Refer to Figure 4.1 to select which strategy(ies) would be appropriate in time and space for the specific inlet system.

    c. Refer to Table 4.2 for a summary of the tactical options for the selected strategy(ies).

    d. Consider operational constraints that may apply to the specific inlet system.

    e. Select strategies and tactical options.

4. VERIFICATION.

    a. Conduct site visits and field deployment exercises.

    b. Modify planned strategies and tactics as appropriate.

A.2 User Guide for Selection of Options During a Response Operation Appendix

1. GATHER INFORMATION.

    a. Obtain chart(s), vertical or oblique aerial photographs, and satellite imagery of the inlet system.

    b. Obtain predicted tide tables for the location.

    c. Determine the estimated arrival time of oil at the inlet system.

    d. Identify what types and amounts of response equipment are available.

    e. Identify deployment times, that is, when can the equipment be in place to contain, recover or redirect oil.

    f. Consult an inlet-specific plan, as might be presented in a Geographic Response Plan, then go to Step 4.

    g. In the absence of an inlet-specific plan, follow Steps 2, 3 and 4 below.

2. RECOGNIZE INLET FEATURES.

    a. Use the generic model of an inlet system (Figures 2.1, 2.2 and 2.6) and the steps listed in Section 2.3.4 to identify the component features of the inlet.

    b. Complete the template (Table 2.2).

    c. Bear in mind that not every inlet has the symmetry and character of the generic model shown in Figure 2.1.

3. UNDERSTAND THE DYNAMICS OF AN INLET SYSTEM.

    a. After the components have been identified, read Section 2.2 that describes some of the key processes that operate in the different parts of the inlet system.

    b. Consult Table 2.3 and Figure 2.9 which present the same information in tabular and graphic forms respectively, to understand how water depth and current patterns change for each of the component features as the tidal waters ebb and flood.

    c. Consult Sections 3.1 and 3.2 for oil movement through an inlet system on a flood tide.

    d. Read Sections 3.3 and 3.4 to identify some of the operational opportunities and constraints that are typical of inlet systems.

4. SELECT RESPONSE STRATEGIES AND TACTICS.

    a. Consult Section 4.1 to develop a regional response strategy that includes containment and recovery or elimination of the oil before it reaches the inlet area.

b. Refer to Figure 4.1 to select which strategy(ies) would be appropriate in time and space for the specific inlet system.

c. Refer to Table 4.2 for a summary of the tactical options for the selected strategy(ies).

d. Consider operational constraints that may apply to the specific inlet system.

e. Select strategies and tactical options and determine applicability for different tide stages.

Appendix B

Barnstable Harbor

Working Example of Using a Chart to Recognize the Physical Components of a Tidal Inlet

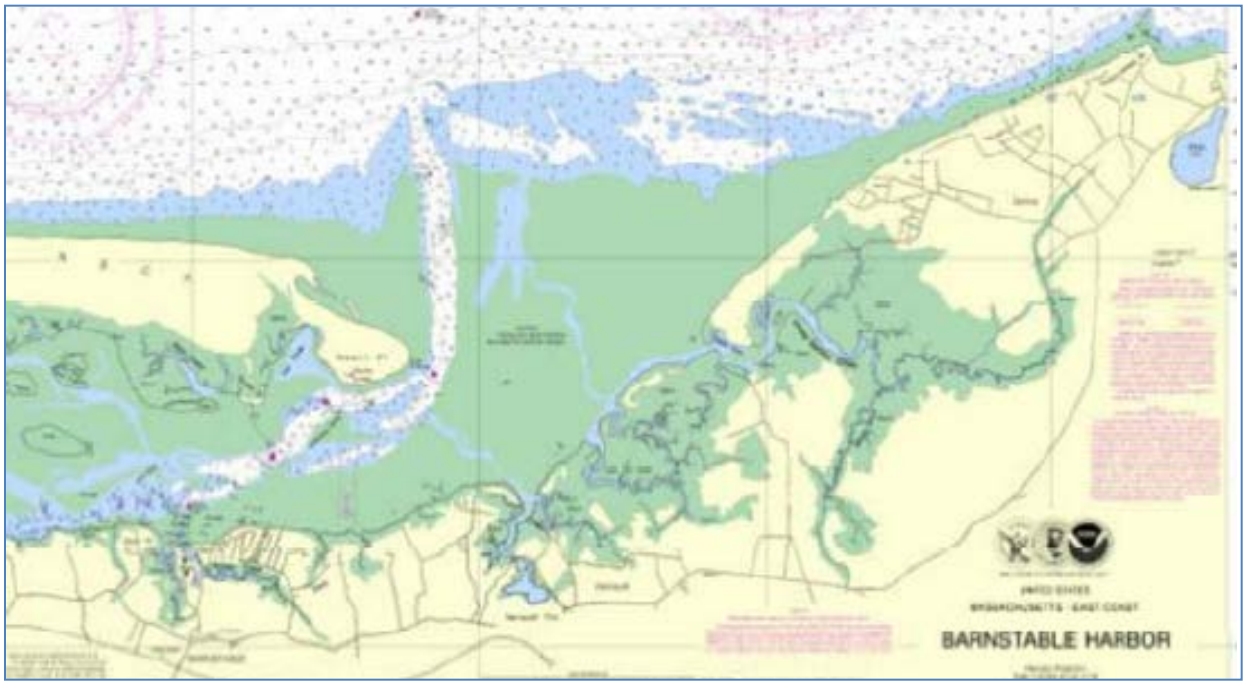

Figure B.1. NOAA Nautical Chart # 13251

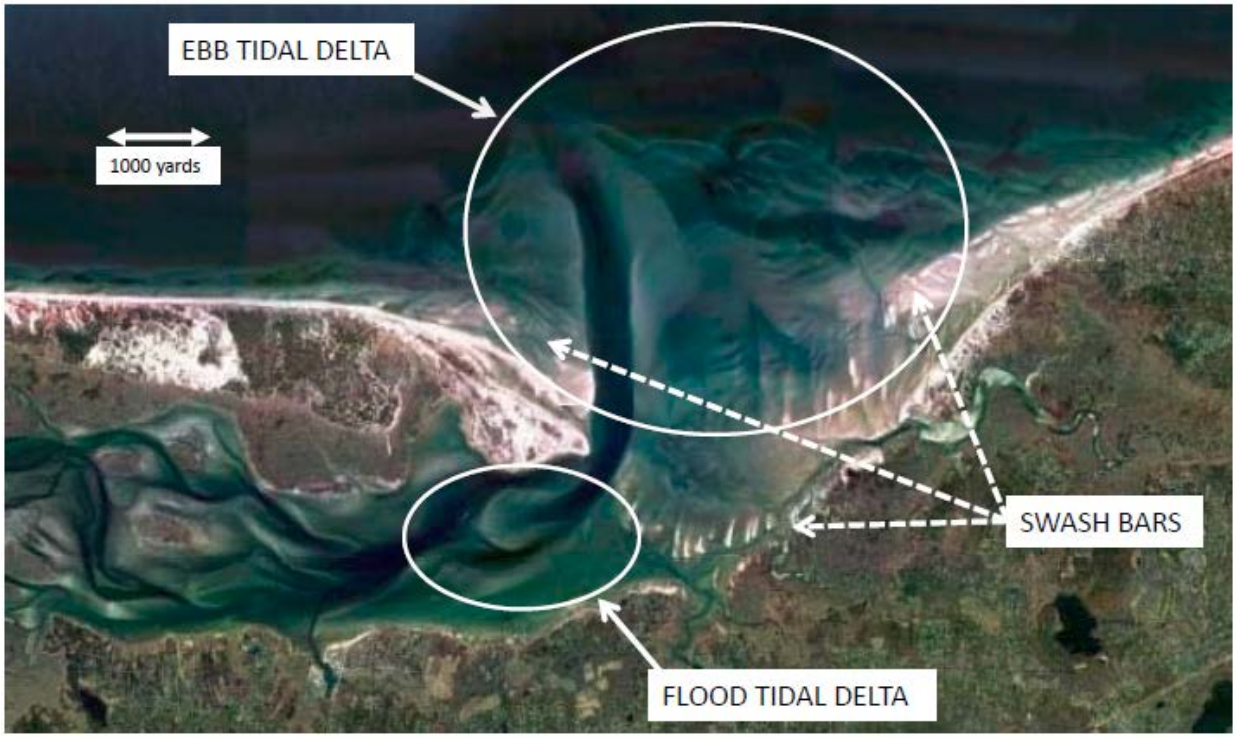

Figure B.2. Satellite Image: Time of Image with Respect to Tidal Water Level is Not Known

- LW and HW lines and depth contours are highlighted on enlarged sections of the nautical chart.
- Morphological components are identified from an interpretation of both the chart and the satellite image.
- These are labeled as indicated in Figures B.3 and B.4.
- In these examples, the primary channels are labeled in red.
- Spillover lobes on the flood delta ebb shield often are relatively small features at these scales. There are not evident from the chart but one (indicated by the green dot on the Figure B.4) is evident from the satellite image.

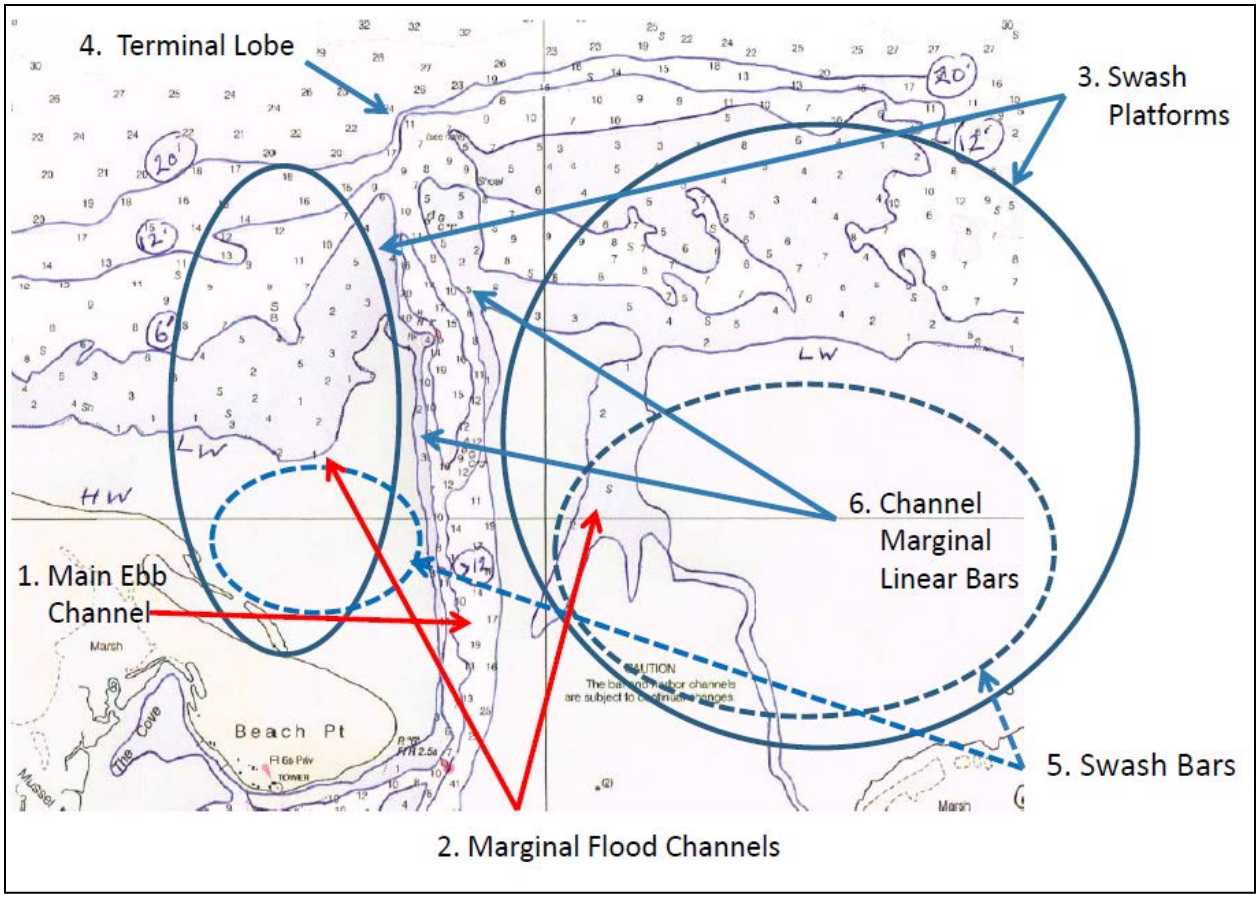

Figure B.3. Ebb Tidal Delta Components

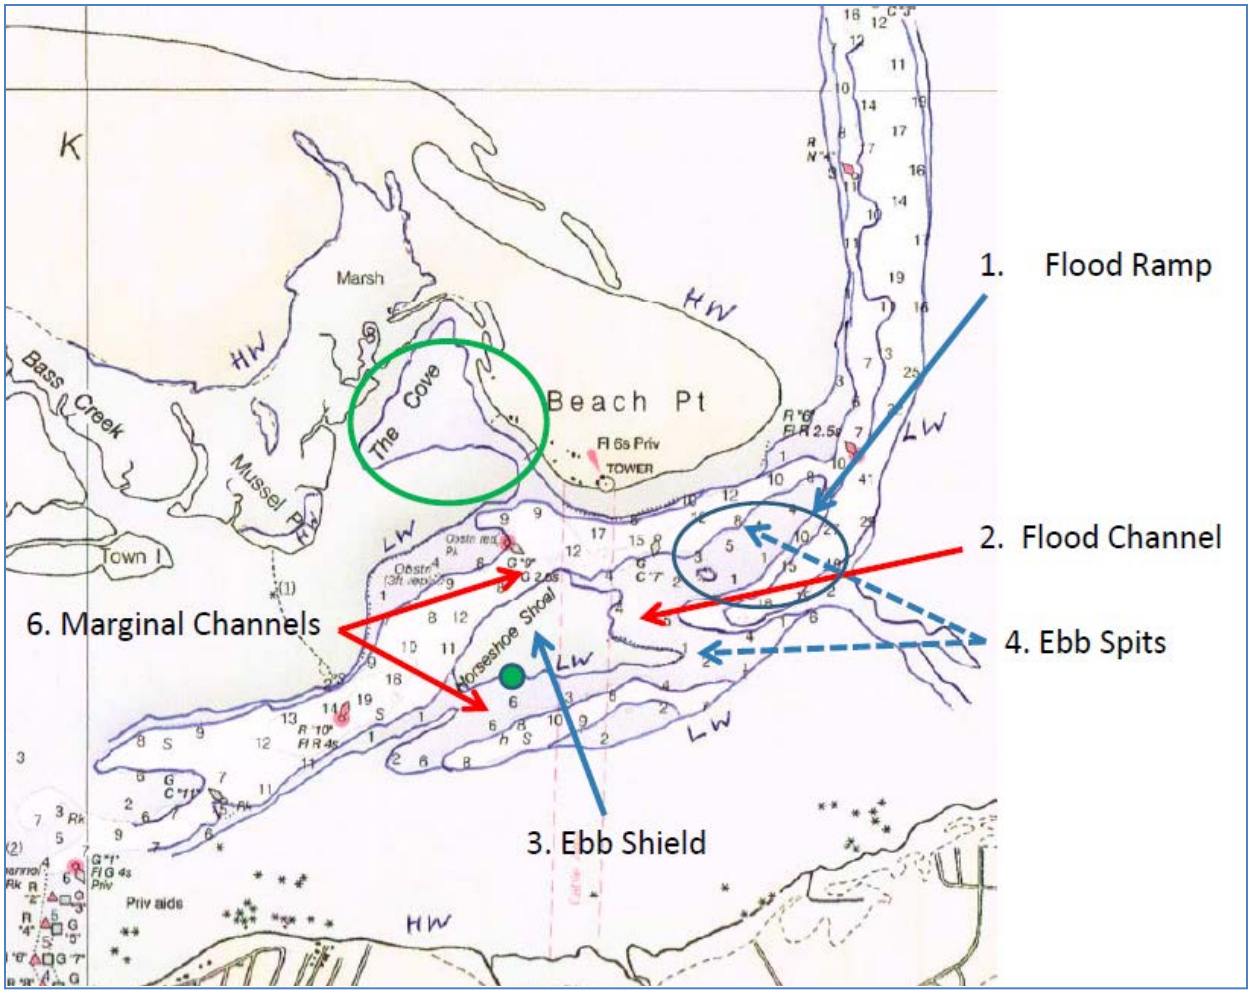

Figure B.4. Flood Tidal Delta Components

Appendix C

Essex River Inlet

This example shows an interpretation of the ebb and flood tidal delta components at the Essex River inlet, MA, from satellite imagery. The numbered components are listed in Figures 2.2 and 2.6.

Incident Command Post Recommendations

Instructions to Set Up

Incident Command Post

Sector Delaware Bay
Incident Command Post setup
Quick Response Card (QRC) MISC-11
Updated 01/19/12

SITUATION: Sector Delaware Bay Command Staff determines the need to stand up an Incident Command for a large-scale incident or event and it is necessary to set up an Incident Command Post (ICP) outside of the Sector Command Center.

PROCEDURES: Once the Sector Commander designates the multipurpose room as the ICP, the Command Duty Officer should contact Officer of the Day to set up the ICP using MAA personnel. Officer of the Day should follow the following procedures as appropriate:

1. Pull out ICP layout diagram.
2. Set up tables as shown in the diagram. The diagram is posted on Cage #2.
3. Grab black flat extension cords (Cage #4). You will need 6 of them along with two power strips per extension (Cage #4).
4. Grab the 2 portable walls and set up according with diagram.
5. Grab computer cables and phones (Cage #5). The phone cables are already plugged into the phone jacks in the back of the MPR near the large poster printer.

    a. **Situation table-** 2 computer cables and 1 phone line. (Phone line will go from the MPR telephone in the front. Use extension 4949). This phone will be shared with Resources Section table.
    b. **Resources table-** 2 computer cables.
    c. Planning Section table- 3 computer cables and 1 phone line. Phone is in a box in Cage # 5. (Phone line is located in the back of the room by the large printer. Use extension 4894which is marked on the phone line).
    d. **Port Partners table-** 4 computer lines and 1 phone line. (Phone line is located in the back of the room by the large printer. Use extension 4874 which is marked on the phone line).
    e. **Operations Section table-** 4 computer cables and one phone line. (Phone line is located in the back of the room by the large printer. Use extension 4849 which is marked on the phone line).

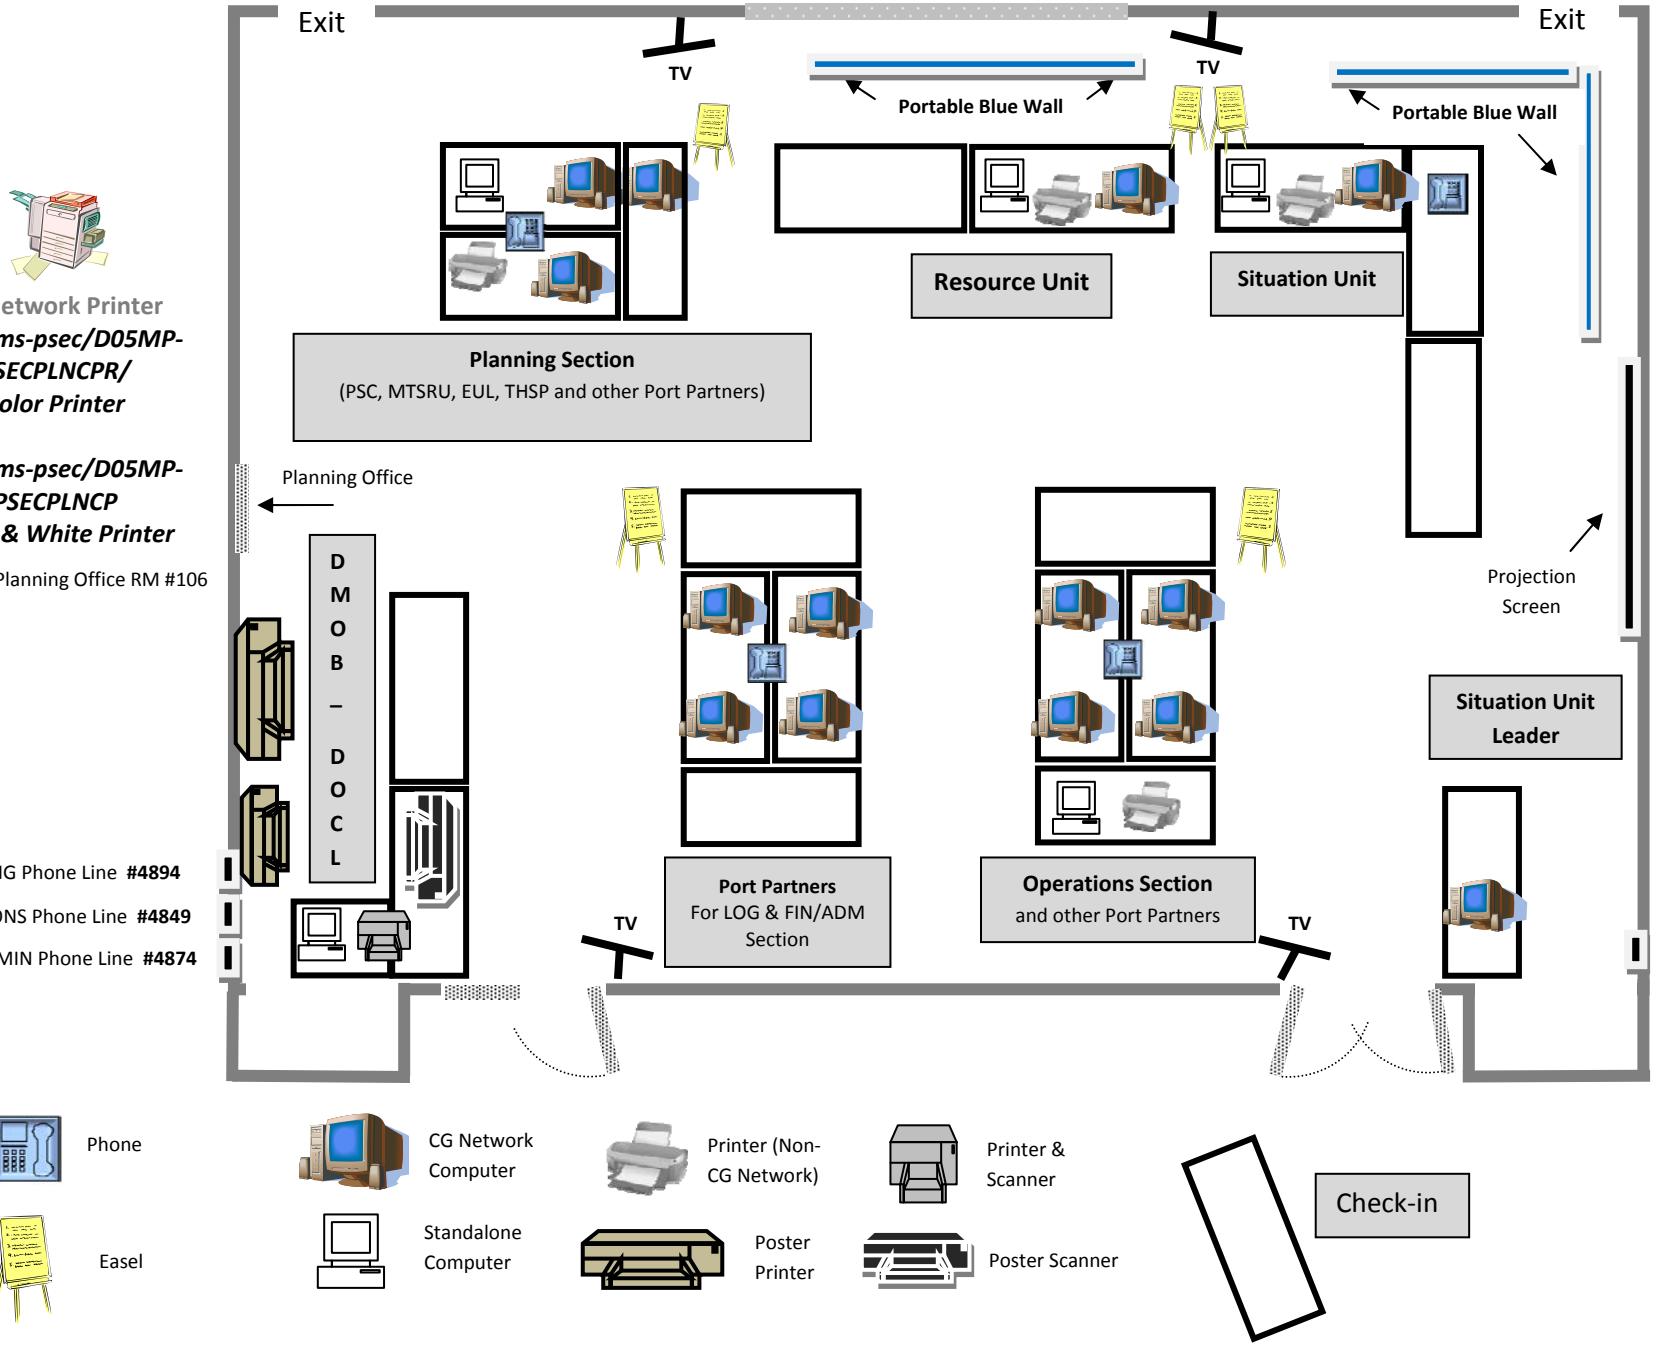
6. Note: Run all cables along the walls up and around doors and secured to ensure there are no safety hazards. (Cage #4 contains plenty of duck tape, look in the back of the cage).
7. Go to Cage # 2 and pull out Situation Unit Leader (SITL) and Resources Unit Leader (RESL) supplies and place on the appropriate tables. Cage # 2 is dedicated to SITL & RESL.
8. Go to Cage # 1, pull out Command & General Staff black go kits bags and place all bags on Planning Section Chief table.
9. Cage # 1, grab box with plastic triangle shaped section signs and place them on the appropriate desk IAW diagram.
10. Grab black pelican case with portable printers (Cage # 5) and place them at the following locations:

    a. Situation Unit Leader- 1
    b. Resources Unit Leader- 1
    c. Planning Section Chief- 1
    d. Operations Section Chief- 1

11. Grab small scanner printer located at Cage # 5 and set up on Demobilization/ Documentation Unit table. There should already be the large poster scanner on the Demobilization/ Documentation Unit table.
12. Grab easel boards out of Cage # 5 and set up IAW diagram.

ADDITIONAL COMMENTS:
All the Incident Command Post equipment is located in the multipurpose room. The room set up layout is posted on the cages. There are currently 4 available phone lines and 23 computer connections. All computer equipment will be provided by the respective users.

9770 Multi-Purpose Room Incident Command Post (ICP) Layout - Type III (Planning, Operations, Logistics & Finance/Admin)



Draft MOA Between

SDB and DE National Guard

9771 Memorandum of Agreement with Delaware National Guard

Memorandum of Agreement
Between
The Delaware Army National Guard
and the
United States Coast Guard

1. PARTIES: The parties to this Agreement are the United States Coast Guard (USCG), represented by the Commander, Sector Delaware Bay and the Delaware National Guard (DNG).

2. AUTHORITY: This Memorandum of Agreement (MOA) is authorized under the provisions of Title 33 United States Code 1321 (j), as amended by §4202 of the Oil Pollution Act of 1990 and Title 14 United States Code §141(b).

3. PURPOSE: This MOA is to facilitate the transfer of location for the Incident Command Post to a Delaware National Guard Armory listed below in the event of an oil spill, hazardous material release, chemical, biological or radiological incident on the C & D Canal, Delaware River/Bay, or off shore within Sector Delaware Bay's Area of Responsibility. This MOA will provide an alternate site for the Incident Command Post under the Area Contingency Plan (ACP) requirements.

   a. Designated alternate Incident Command Posts:

      - Kent County: Milford Armory, 500 N. Walnut Street, Milford, DE
      - New Castle County: Scannell Armory, Governor Bacon Health Center, Delaware City, DE
      - Sussex County: Dagsboro Readiness Center, Route 3, Dagsboro, DE

4. RESPONSIBILITIES:

   a. The Delaware National Guard agrees to:

      (1) Provide alternate temporary facility for the USCG to establish an Incident Command Post if the incident occurs in an area geographically better suited to be managed from one of the Armories listed in item three (3).

      (2) Identify the availability of in-building workspace to be utilized during the temporary relocation and maintain documentation for any associated cost(s) for space, equipment, and utilities.

      (3) Security provided by the Delaware National Guard shall verify, or supervise a contractor to verify the identification of USCG personnel seeking to gain access into the armory requested for use by the Coast Guard. Any person without a valid

Military, Coast Guard Civilian Employee, other Federal/State agency employee, or Civilian Contractor Identification Card will be denied access.

b. USCG, Sector Delaware Bay agrees to:

(1) Provide, at minimum, a 24-hour notification to the Director of Military Support, DNG of the need to utilize one of the facilities listed herein, and an estimated duration of relocation.

(2) Ensure Incident Command Post personnel relocating to the requested armory use an entrance designated by the Delaware Army National Guard.

5. POINTS OF CONTACT:

United States Coast Guard
Commander
Sector Delaware Bay
1 Washington Avenue
Philadelphia, PA 19147
(215)-271-4990

Delaware Army National Guard
Director of Military Support
Joint Force Headquarters
First Regiment Road
Wilmington, DE 19808
(302)-326-7085

6. OTHER PROVISIONS:

a. Nothing in this Agreement is intended to conflict with current law or regulations or directives of the United States Coast Guard, U.S. Department of Homeland Security, the Delaware National Guard, or the State of Delaware. If a term of this Agreement is inconsistent with such authority, then that term shall be invalid and the parties will rapidly consult to determine if this Agreement remains a useful and mutually beneficial instrument.

b. Nothing in this agreement shall be deemed to constitute a waiver of any immunity, which may exist in any action against the Delaware Army National Guard or the United States Coast Guard.

c. Commander, Sector Delaware Bay; Director of Military Support, DNG, shall ensure personnel are familiar with this MOA to expedite the transfer of Incident Command Post personnel to one of the three DNG Armories listed herein.

d. Should it become evident that the occupation of any of the three armories named herein by Incident Command Post personnel may extend beyond 30 days, all signatories will determine if the armory will be a suitable/available long-term location.

e. Except in matters of national security, the DNG will allow an alternate site for the Incident Command Post to be located and fully moved before the Incident Command Post can be evicted from the armory in use.

7. EFFECTIVE DATE: The terms of this Agreement shall become effective when all parties identified below have signed this Agreement.

8. MODIFICATION: This Agreement may be modified upon the mutual written consent of the parties.

9. TERMINATION: The terms of this agreement will remain in effect until terminated by either party. The parties will review the agreement every ___ years and may alter the agreement by written mutual agreement. All alterations will be documented in a letter, signed by cognizant representatives of both parties, and appended to each party's copy of the original agreement. The parties will determine at each review whether the alterations require the agreement to be rewritten. Either party may terminate this agreement upon thirty days written notice to the other party.

News Release

Coast Guard responds to TYPE spill in LOCATION

PHILADELPHIA — Coast Guard crews are responding to a report of a TYPE spill near LOCATION, TIME/DATE.

REPORTING SOURCE notified Coast Guard Sector Delaware Bay of the spill, which took place at LOCATION. Initial reports indicate the spill is coming from a VSL/FACILITY/SUSPECTED SOURCE due to SUSPECTED CAUSE.

The SUSPECTED SOURCE was reportedly CARRYING/TRANSFERRING nearly MAX POTENTIAL gallons of PRODUCT, but it is not known how much of the product was discharged.

Coast Guard Sector Delaware Bay pollution responders and state environmental officials are on scene investigating the impact of the spill. A broadcast notice to mariners is in place advising mariners to transit the area with caution due to pollution.

The cause of the incident is under investigation. Drug and alcohol tests will be performed.

News Release

RESPONSE TYPE spill response continues in LOCATION

PHILADELPHIA — Members of the unified command continue to coordinate PRODUCT spill recovery operations in LOCATION, DATE.

Responders have recovered more than ----- gallons of oily water mixture and -- yards of solid soiled waste. More than ----- feet of containment boom and -- responders have been deployed to conduct shoreline assessments and recover as much product as possible.

Shipping traffic is still required to maintain minimum safe speed from ------ to ------ to minimize the impact to clean-up operations. The unified command will continue to closely monitor the situation and will adjust restrictions to commercial and recreational boating traffic accordingly.

The unified command consists of representatives from the UC MEMBER AGENCIES.

WHAT HAPPENED, WHERE at approximately TIME/DATE.

There have been no reports of impacted wildlife.
Address public safety concerns/messaging.

The cause of the incident is under investigation. Drug and alcohol tests will be performed.

Unified Command Approves Dispersants

Joint Information Center

(Unified Command logos/names here)

News Release

Unified Command has approved the use of dispersants for the RESPONSE NAME

PHILADELPHIA — The Unified Command has approved the use of the chemical dispersant Name in order to break up the oil slick and protect shoreline habitat, seabirds and marine mammals from becoming oiled due to the PRODUCT spill recovery operations in LOCATION, DATE.

Dispersants break down oil into smaller particles helping it to disperse and sink below the surface. Before dispersants are used a range of criteria must be met:

- The application of dispersants must be 3 – 200 miles off shore and not within a National Marine Sanctuary.
- The application of dispersants must provide an environmental benefit for species at risk and/or species of special concern.
- The application of dispersants must be done safely and in accordance with standard marine and aviation practices.

Federal and state trustee agencies identified the LIST OF SPECIES as species of special concern and of significant risk of injury from this oil spill, especially if the spill were allowed to spread and hit sensitive habitats and shorelines.

Wildlife and resource agencies believe that these species will be benefited by the use of dispersants and will monitor the operations as appropriate for these species.

(PROVIDE ANY INFORMATION, AS NECESSARY ON FISHERIES AND PLANS FOR ANY SEAFOOD TAINTING PANELS)

The unified command consists of representatives from the UC AGENCIES.

THERE HAVE BEEN NO REPORTS OF IMPACTED WILDLIFE.

The cause of the incident is under investigation. Drug and alcohol tests will be performed.

###

Fishing Activity Suspended

Date: _____

Contact: _____

Joint Information Center

(Unified Command logos/names here)

News Release

Fishing activity suspended due to SPILL RESPONSE in LOCATION

PHILADELPHIA — Members of the unified command have suspended all fishing for human consumption in the areas affected by the INCIDENT NAME until at least DATE, or when state health officials have determined that fishing can safely be reopened.

The AGENCIES are collecting samples of fish and shellfish from the area impacted by the spill. Samples of FISH are being collected from various locations in WATER BODY and along the coast. The samples will be tested for toxic chemicals that are found in the oil, which can accumulate to dangerous levels in fish and shellfish. The main toxins of concern in the oil that was released are a group of chemicals called polycyclic aromatic hydrocarbons. Long-term exposure to high levels of PAHs is associated with an increased risk of developing cancer.

AGENCY's safety guidelines call for avoiding consumption of any fish or shellfish from WATER BODY until analysis of the collected samples is completed. Visible oil or oily smell are obvious indications of contamination, but fish and shellfish from the spill area could still pose a potential risk even if there are no visible signs of contamination.

In addition, health officials are asking people to stay away from shore areas until cleanup efforts are completed. After beaches are reopened, people who find oil deposits along the shore should report them to cleanup officials by telephoning CONTACT.

Safety advice for beaches in the spill area.

- Avoid direct contact with spilled oil, which can cause skin irritation. Prolonged contact can cause rashes.
- If you get oil or tar on your skin, wash it off with soap and water, and be certain to wash your hands before eating.
- If you get oil on your clothing, wash it in the usual way. There is no need to use harsh detergents, solvents or other chemicals to wash oil from skin or clothing.
- Do not burn driftwood or other debris that may be contaminated with oil.
- Use common sense. Do not swim in water with an oil slick and do not swallow water from the area. Oil-contaminated water can cause choking and lead to severe pneumonia if it gets into the lungs.

- Avoid prolonged exposure to fumes in closed spaces.
- Fish and shellfish caught from waters outside the spill area remain as safe to eat as before the spill, but marine life from the spill area should be avoided until the evaluation of its safety is completed.

THERE HAVE BEEN NO REPORTS OF IMPACTED WILDLIFE.

The cause of the incident is under investigation.

###

Volunteer Hotline Established

Joint Information Center

(Unified Command logos/names here)

Date: _____
Contact: _____

News Release

RESPONSE NAME Volunteer Hotline Established

PHILADELPHIA — The unified command has activated a volunteer hotline at 000-000-0000 for people who would like to contribute to the spill recovery operations near LOCATION, DATE.

The Volunteer Hotline will provide updates on the spill response and will allow potential volunteers to provide their contact information, availability, and applicable skills.

"We appreciate the public's outpouring of support and their desire to help out in the unfortunate event," said NAME, POSITION. "We are doing everything we can to minimize impacts to the environment and protect the wildlife that lives here. At this time, we are evaluating how we may best use volunteers in our response in a way that is both safe for the volunteers and productive."

Volunteers have been used in previous oil spill responses, with activities coordinated through the unified command. By calling the Volunteer Hotline number, prospective volunteers will get the most up-to-date information on whether their time and skills will be needed.

Volunteers and others should stay away from the spill site and not attempt to rescue oiled wildlife, as this may hamper clean-up efforts and increase the danger to both wildlife and humans. Oil is a toxic substance and only those with hazardous materials training are authorized to clean up oil. For the safety of both the public and the animals, only trained wildlife specialists will handle oiled wildlife.

The public can help at this time by reporting any oiled animals to 000-000-0000 (potentially Tristate Bird Rescue). This facility uses modern equipment and facilities and has trained staff to care for the oiled wildlife. Personnel experienced in animal capture and handling will respond at the earliest opportunity, presenting the best chance for wildlife survival.

The public's cooperation is greatly appreciated.

For more information on volunteering, visit WEBSITE.

###

Fact Sheet Checklists

Fact sheets produced and/or released by the PIO/JIC may include the following:

1st Fact Sheet

- Facts about the incident as known.
- Exclusion zones and evacuations.
- Total spill potential, expressed in gallons.
- MSIB information.
- Air monitoring information.
- Wildlife impacts/hotline number.
- Claims line (if established).
- Equipment/resources deployed.
- Number of personnel responding.
- Contact phone numbers for media.

Subsequent Fact Sheets

- Amount and type of product spilled.
- Location and time of the spill.
- Cause of the spill.
- Vessel information.
- Injuries or casualties.
- Responsible party.
- Trajectory of the oil.
- Public safety message.
- Evacuations.
- Air monitoring information.
- Environmental impacts.
- Beach closures.
- Wildlife impacts.
- Fishery closures.
- Cleanup contractors.
- Agencies responding.
- Actions taken.
- Resources applied and numbers.
- Personnel deployed.
- Future actions.
- Special considerations (dispersant use, port of refuge).
- Status of the investigation.
- Third party claim line.
- Oiled wildlife hotline.
- Volunteer hotline.
- Cost of the spill.

News Release

FACT SHEET: RESPONSE TYPE spill response near LOCATION

PHILADELPHIA — Members of the unified command continue to coordinate PRODUCT TYPE spill recovery operations in LOCATION, DATE.

INCIDENT SUMMARY. Emergency response operations will continue and are being closely monitored until long term salvage or oil pollution mitigation plans can be finalized.

Unified Command:

- Members consist of the WHO.
- Agencies contributing to the response include WHO ELSE.

Current activity:

- Responders continue oil/water mixture removal from the SUSPECTED SOURCE.
- Crews continue to tend the hard boom while removing and replacing the sorbent boom used to collect the oil.
- Responders deployed skimmers.
- Responders place recovered oil into a tank where it will decant, settle and separate, for later quantification.
- Number of wildlife affected, being treated, released.

Quantities:

- VESSEL had a maximum capacity of ------ gallons aboard at the time of the incident.
- ------ gallons of oil/water mixture recovered to date.
- The Oil Spill Liability Trust Fund is currently at $--- million. More information on the OSLTF is available at http://www.uscg.mil/npfc/About_NPFC/osltf.asp.

Equipment and personnel on scene:

- ----- boats, and aircraft
- ----- skimmers
- ----- skiffs
- ---- holding tank for recovered oil
- ---- vacuum truck
- ---- personnel from -------
- ---- on scene recovery capacity compared to state requirements---- and federal requirements----
  * Note: Only use this metric if the on scene capacity is greater than state and federal requirements.

Safety:

- Coast Guard Sector Delaware Bay is requesting all vessel traffic inbound and outbound of ----- travel with no wake as a safety measure for responders working in and on the water.

Wildlife:

- 000 wildlife impacts have been reported at this time. Crews will monitor for oiled wildlife for the duration of the spill cleanup. Anyone seeing oiled wildlife should report it to 000-000-0000.

Fishery Closure:

- LOCATION

Ship Facts:

- Built in ----.
- Length -----
- Beam ____
- Draft -----
- ----- Flagged
- Max capacity of the tanks is approximately ------ gallons.

News Release

FACT SHEET: Unified Command

PHILADELPHIA — A Unified Command (UC) is indispensable to response activities and requires a clear understanding of the roles and responsibilities of each participating organization. Success requires unity of effort, which respects the chain of command of each participating organization, while harnessing seamless coordination across jurisdictions in support of common objectives.

Use of the Incident Command System (ICS) is an important element across multijurisdictional or multiagency incident management activities. It provides a structure to enable agencies with different legal, jurisdictional, and functional responsibilities to coordinate, plan, and interact effectively on scene. As a team effort, the UC is made up of Incident Commanders (IC) from agencies with jurisdictional authority and/or functional responsibility for the incident, as well as staff for coordinating planning, operations, finance, and support. This allows each agency or IC to provide joint support through mutually developed incident objectives and strategies established at the command level. Each participating agency maintains its own authority, responsibility, and accountability, while the UC provides a forum for these agencies to make consensus decisions.

The need for UC arises when incidents:

- Cross geographic boundaries (e.g., two states, international boundaries);
- Involve various governmental levels (e.g., federal, state, local);
- Impact functional responsibilities (e.g., Search and Rescue, fire, oil spill, EMS); or
- Some combination of the above.

The UC is responsible for:
(1) developing a single set of objectives;
(2) using a collective, strategic approach;
(3) improving information flow and coordination;
(4) creating common understanding of joint priorities and restrictions;
(5) ensuring that no agency's legal authorities are compromised or neglected; and

(6) optimizing the combined efforts of all agencies under a single plan.

UC representatives must be able to:

- Agree on incident objectives and priorities;
- Have the capability to sustain a 24-hour-7-day-a week commitment to the incident;
- Have the authority to commit agenc
- Have the authority to spend agency
- Agree on constraints/limitations, pr
- Agree on an incident response orga
- Agree on the appropriate Comman direction for on-scene tactical resou
- Commit to speak with "one voice" Information Center (JIC), if establi
- Agree on managing sensitive infor
- Agree on logistical support includi
- Agree on cost-sharing and cost acc

[Grab your reader's attention with a great quote from the document or use this space to emphasize a key point. To place this text box anywhere on the page, just drag it.]

In general, a successful UC is a team. A UC is to skillfully use the strengths of each IC and acknowledges each representative's unique capabilities and authorities. A UC has a shared understanding of the situation and agrees on common objectives to bring the incident to closure. A UC is open to different perspectives and knows that contentious issues may arise, but that ICS inherently relies on the UC framework to provide the forum to resolve problems and find solutions.

News Release

FACT SHEET: Boom

PHILADELPHIA — Spilled oil may be contained or diverted by using a floating physical barrier called boom. Boom floats on the surface, but parts may extend above and below it. Because oil primarily floats on water, the boom is utilized to collect or direct floating oil.

Boom length is measured in feet, and it is not unusual for thousands of feet of boom to be deployed for even a modest spill. Boom sizes are described in inches of freeboard and skirt. A 6-by-12 boom has a six-inch-high freeboard and 12-inch-deep skirt. Boom typically is manufactured in high-visibility colors, such as white, yellow or orange, for easy tracking by response teams and for the safety of vessels operating nearby.

Boom is not a perfect containment device. Waves can carry oil over a boom and a current may force oil under it. Debris or ice can also limit the effectiveness of boom. Boom is more effective directing oil which moves at a slight angle to the line of boom than as a barrier blocking the slick's movement. Such circumstances may require replacing light boom with boom having higher freeboard and deeper skirt. Multiple lines of boom are more effective at containing oil than a single line.

Limitations on the use of boom include the time required to get it to the scene, load it on boats, carry it to the spill and deploy it. Boom also has to be stored within reasonable traveling distance of a potential spill. Once used, boom has to be de-contaminated of the waste oil or chemical before it can be stored. If sorbent boom is used, it has to be disposed of safely once it has been contaminated with oil or chemical waste. Some types of boom have operational limitations, such as the loss of ballast or buoyancy if the water- or air-filled sections are breached by abrasion or handling.

A single string of boom often will serve several purposes simultaneously. Typical tasks for boom include:

- Encirclement – laying one or more barriers of boom around the source of the spill to keep it from spreading or around a section of slick to hold it in place for recovery. Tankers transferring cargo may be encircled by boom as a precaution, even though there is no spill.
- Diversion – setting one or more lines of boom at angles into or across a moving slick's path to guide it toward an area where it can be confined and recovered, or to let it safely pass a sensitive area. Diversion is primarily used near shore on rivers. It is most effective where currents are weak and there is little wave action.
- Collection – towing boom in a "V," "U," "J," or teardrop configuration through or around a slick to gather oil together for recovery or burning.

NEWS RELEASED IS CONTINUED BELOW

- Recovery – placing sorbent boom where it will contact floating oil and absorb or adsorb some of it for later recovery, or similarly using weir boom to catch oil and transport it to a skimmer.
- Exclusion – stringing boom around un-oiled areas to keep oil out. The exclusion booming may also divert moving oil away from a sensitive area.

Although different types of boom may look different, virtually all boom has five common components:

- Flotation device – keeps the boom at the water's surface, where floating pollutants are.
- Freeboard – the part that rises above the water's surface and prevents waves from washing pollutants over the top.
- Skirt – similar to freeboard but below the surface, the skirt prevents the current from washing floating pollutants under the boom.
- Ballast – this is the weight at the bottom of the skirt that keeps it hanging vertically against a current.
- Tension line or strength member – cables, chains or lines extending the length of the skirt or freeboard and, like the main boom cable, chain or boom, attached at the end.

In general, boom with a high freeboard and short skirt is called fence boom, because it prevents the pollutant from moving across the surface. A boom with a longer skirt and shorter freeboard is a curtain boom, and is good to prevent pollutants from moving just below the surface. Some boom includes both characteristics.

Similar to fence and curtain boom is tubular containment boom, such as Texas Boom. Tubular boom has at least two sections…one or more air-filled tubes above the water, for flotation and to keep oil from crossing the boom on waves, and one or more water-filled tubes below the water for ballast and to keep oil from passing beneath the boom.

Sorbent boom made of absorbent or adsorbent material to collect and hold oil within the boom itself. It's most effective with thin layers of pollutants and light winds or currents. Once soaked to capacity, the boom can be recovered and the collected oil squeezed out. Once soaked, it is heavier than simple barrier boom and so needs extra effort to remove from the water.

Recovery boom, such as three-weir boom, has four sections. An air-filled tube extending above the water for buoyancy and to keep oil from passing over the boom. A water-filled tube extending below the surface for ballast and to keep oil from passing beneath the boom. A discharge tube which collects oil from inlets between the air- and water-filled tubes and moves it the length of the boom to a recovery device. A smaller air-filled tube to keep the discharge tube afloat. Recovery boom not only holds floating pollutants in place, but is an active part in recovering pollutants from the water.

A frequent problem in the use of boom is the fact that each end of the boom must be anchored in place. On a small stream, it can be anchored to trees or rocks on land; in a harbor, it may be attached to piers or seawalls. On open water, however, the ends must be literally anchored, using lines attached to weights on the lake or sea bottom, or they must be attached to boats. The use of a boat to anchor one end of a boom means that boat cannot be used for any other assignment, and boats may be in short supply.

News Release

FACT SHEET: Oil Types

PHILADELPHIA — Oil spills along coasts affect many parts of the environment, such as water, ocean bottom, shoreline sea birds, marine mammals, shellfish, and people.

Major oil spills most commonly involve oils shipped in large quantities at sea, such as crude oil/petroleum, No. 1 and No. 2 fuel oils, diesel oil, Bunker C oil, kerosene, and jet fuel. Oils are compounds, complex mixtures that vary widely in composition.

Oils can be described as belonging to one of five groups:

- I very light oils (jet fuel, gasoline);
- II light oils (diesel, No. 2 fuel oil, light crude, home heating);
- III medium oils (most crude oils);
- IV heavy oils (heavy crude oils, No. 6 fuel oil, Bunker C);
- V group (very heavy oils).

The different types of oils behave in different ways during a spill, so the response to a spill varies, depending on the type of oil and quantity released.

Most oil has a density less than water and floats. The natural tendency of oil is to spread in a thin layer on the surface of the water as a sheen or film. Such sheens are extremely difficult to recover and do not remain for long periods; however, they do represent a continued threat to fish and wildlife, particularly nesting birds. Under turbulent conditions, oil is more likely to disperse into the upper layers of the water.

Oil changes rapidly once it is spilled into water. These changes are enhanced by the processes of evaporation, dilution and emulsification (when water incorporates into the oil, forming a stable mixture). Some changes help dissipate spilled oil, but others can make it linger in the water, on the bottom, or on the shore. Evaporation tends to remove the more toxic components and reduces the toxicity of spilled oil. Emulsification, on the other hand, can slow degradation of spilled oil.

Weathering describes the physical, chemical, and biological changes that happen to crude oil and refined petroleum products once they begin to interact with the watery environment. Ultimately, the more toxic elements of oil products spilled in the marine, estuarine, or freshwater environment are broken down. Exposure to air, sunlight, wave and tidal action, and certain microscopic organisms degrades and/or disperses oil. The rate of degradation and dispersion depends on many factors like the type of oil, weather, temperature, and the type of shoreline and bottom.

Very light oils are highly volatile, which means they evaporate quickly, usually completely within one to two days after a spill. These oils are also flammable and contain high concentrations of soluble toxic compounds. Very light oils can mix with water and kill aquatic life that lives in the upper layers. Cleanup is usually not necessary, or possible, with spills of very light oil.

Light oils are moderately volatile, but can leave a residue of up to one-third of the amount spilled after a few days. These oils contain moderate concentrations of soluble toxic compounds. Light oils leave a film or layer on intertidal resources with the potential of long-term contamination. Cleanup can be very effective on spills of light oil.

Medium oils are less volatile, leaving a residue of about two-thirds of the amount spilled after 24 hours. These oils are less likely to mix with water, and oil contamination of intertidal areas can be severe and long-term. The impact of medium oils on waterfowl and fur-bearing mammals can also be severe. Cleanup is most effective with spills of medium oil if conducted quickly.

Heavy oils have far less evaporation or dilution potential, and they weather more slowly. These oils do not readily mix with water. Spills of heavy oils can cause severe contamination of intertidal areas and possible long-term contamination of sediments. Heavy oils have severe impacts on waterfowl and furbearing mammals. Shoreline cleanup in spills of this type is difficult and long-term under most conditions.

Group V oils, mostly very heavy oils, can float, sink, or hang in the water. These oils can become oil drops and mix in the water, or accumulate on the bottom, or mix with sand and then sink. As a rule, these oils are less toxic than lighter oils, however they pose significant problems to responders because they are extremely difficult to track or predict.

Spill response teams of federal, state and local agencies, organizations and industry representatives have prepared contingency plans for oil spill emergencies.

News Release

FACT SHEET: Tarball

PHILADELPHIA — Tarballs are remnants of oil spills or natural oil seeps in the Ocean. When crude oil from a seep, spill, or a heavier refined product floats on the ocean surface, its physical characteristics change.

During the first few hours of a spill or natural release, the oil spreads into a thin slick. Winds and waves tear the slick into smaller patches that are scattered over a much wider area. Various physical, chemical, and biological processes change the appearance of the oil. These processes are generally called "weathering."

Initially, the lighter components of the oil evaporate much like a small gasoline spill. In the cases of heavier types of oil, such as crude oil, much of the oil remains behind. At the same time, some crude oils mix with water to form an emulsion that often looks like chocolate pudding. This emulsion is much thicker and stickier than the original oil. Winds and waves continue to stretch and tear the oil patches into smaller pieces, or tarballs. While some tarballs may be as large as pancakes, most are coin-sized. Tarballs are very persistent in the marine environment and can travel hundreds of miles.

Weathering processes eventually create a tarball that is hard and crusty on the outside and soft and gooey on the inside, not unlike a toasted marshmallow. Turbulence in the water or beach activity from people or animals may break open tarballs, exposing their softer, more fluid centers. Scientists have not been very successful at creating weathered tarballs in the laboratory and measuring the thickness of the crusty outer layer. Therefore, we don't know how much energy is needed to rupture a tarball. We do know that temperature has an important effect on the stickiness of tarballs. As air and water temperatures increase, tarballs become more fluid and, therefore, sticky— similar to an asphalt road warmed by the summer sun. Another factor influencing stickiness is the amount of particulates and sediments present in the water or on the shoreline, which can adhere to tarballs. The more sand and debris attached to a tarball, the more difficult it is to break the tarball open. These factors make it extremely difficult to predict how long a tarball will remain sticky.

For most people, an occasional brief contact with a small amount of oil, while not recommended, will do no harm. However, some people are especially sensitive to chemicals, including the hydrocarbons found in crude oil and petroleum products. In general, we recommend that contact with oil be avoided. If contact occurs, wash the area with soap and water, baby oil, or a widely used, safe cleaning compound such as the cleaning paste sold at auto parts stores. Avoid using solvents, gasoline, kerosene, diesel fuel, or similar products on the skin. These products, when applied to skin, present a greater health hazard than the smeared tarball itself.

There is no magic trick to making tarballs disappear. Once tarballs hit the beaches, they may be picked up by hand or by beach-cleaning machinery. If the impact is severe, the top layer of sand containing the tarballs may be removed and replaced with clean sand. The number of tarballs found on the beach depends on several factors: tanker traffic, wind patterns, sea currents, whether an oil spill or seep occurred recently, and how often the beach is cleaned.

NOAA's Oil Spill Response

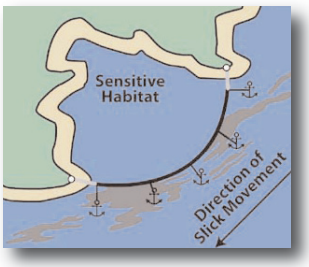
Using Boom in Response to Oil Spills

Fire Boom.

Boom is a common type of oil spill response equipment. It is used to protect shorelines or sensitive locations by acting as a barrier to oil, and to corral oil on the water to enhance the recovery effectiveness of skimmers or other response operations.

How Boom is Used

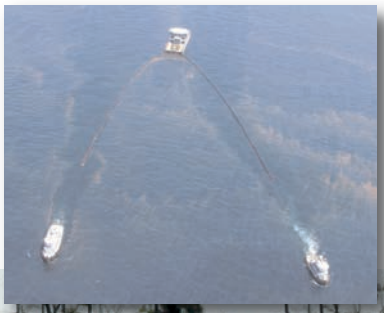
Boom is used in many ways during an oil spill response, including the following:



Boom can be placed to exclude oil from a sensitive stretch of shoreline, such as a coastal marsh, marina, seabird nesting area, or location where marine mammals congregate. This diagram shows how boom would be placed across the mouth of a small inlet to prevent oil from entering the inlet, with anchors used to keep the boom in place. Boom placed to protect an area deflects oil; it does not collect it.

Boom can be placed around a vessel or tank that is leaking oil. The boom confines the oil within a small space so it can be collected.

Boom may be towed behind boats to collect oil, as in the photo at right. Oil that collects in the apex of a towed U-shaped boom can either be skimmed from the water surface, or towed away from the main slick to a location where it is safe to burn it.



(below) Hard Boom.

Types of Boom

Four main types of boom are used for oil spill response. **Hard boom** is typically made of PVC or similar durable material. It consists of an inflated chamber that rides above the water, and an attached skirt that hangs down into the water. The two main types of hard boom are ocean boom, designed for use in high seas, and harbor boom, designed for sheltered waters. The primary difference between ocean and harbor boom is the strength of the material, size of the flotation chamber, and depth of the skirt.

Hard boom is used to contain oil. It may be placed around a leaking vessel to corral oil, or anchored offshore of a sensitive area to exclude oil from that area. Hard boom also can be towed behind boats to concentrate oil so that skimmers can recover it.

Fire boom is similar in design to hard boom, but is made of material that can withstand the heat generated by burning oil, which can exceed 2,000º F. Fire boom is used to corral oil to be burned in an on site (in situ) burn operation.

(continued on back)

Sorbent boom looks like a long sausage. It is constructed of a long fabric sock enclosing material that attracts oil but repels water. Unlike hard boom, sorbent boom does not have an attached skirt. Once saturated with oil, sorbent boom must be removed and properly disposed of. It is used to both contain and absorb oil on the water surface.

Snare boom looks like cheerleaders' pompoms tied to a long line. It is placed along shorelines, anchored by stanchions. The "pompom" strands catch tarballs and small quantities of oil brought by tides and waves.

Effective Use of Boom

For several reasons, NOAA recommends that boom be deployed and maintained in a coordinated strategy with other response equipment. For one thing, not all areas can be protected by boom; other response measures must be adopted in those locations. And because there typically aren't enough resources to protect all sensitive locations with boom, it is usually necessary to make tradeoffs when deciding where and when to place boom. For example, choosing to deploy boom to protect the entrance to an ecologically important coastal marsh rather than a recreational beach.

Because boom, once placed in the water, is difficult and time consuming to move, an effective strategy is to stage boom so that it is ready for deployment, but waiting to deploy until oil approaches the area. By using this strategy, responders can ensure that the boom is placed at the optimal location to protect against the oil, whether that location proves to be the originally envisioned site or a different location.

When boom is used to protect a shoreline, it must be tethered securely so that it will not be dislodged. Currents faster than 1.5 knots or even wakes from passing ships can dislodge boom. Rough seas and winds can tear, capsize, and shred boom. An effective method is to deploy concentric rings of boom to protect highly sensitive areas in exposed areas. In estimating the amount of boom needed to protect a given length of shoreline, responders then need to consider whether multiple rings of boom will be deployed.

Boom should never be set out and forgotten; deployed boom must be monitored to ensure that it remains in place. Untended boom can be a barricade to wildlife. For example, dislodged boom can strand on shorelines and prevent sea turtle adults and hatchlings from transiting between shore and water. Dislodged boom anchors can damage corals and sea grass beds. Untended boom also can become a barrier and hazard to ship traffic. Marinas and navigation channels must remain open for response vessels and commercial traffic.

Sorbent boom designed for oil spill response should be used whenever possible for most spill response uses, because it is specifically designed to collect spilled oil from the water surface. NOAA's years of experience in oil spill response and field testing indicate that sorbent boom is much more effective than alternatives such as recycled nylon stockings stuffed with straw and hair.

In a February 2010 NOAA field test, commercial sorbent boom absorbed more oil and much less water than hair boom, which became waterlogged and sank within an hour. NOAA foresees a risk that widespread deployment of hair boom could exacerbate the marine debris problem in the Gulf of Mexico, in that waterlogged hair boom would be especially difficult to retrieve and more likely to break apart. It is possible that hair sorbents (absorbent pads) would be useful for collecting oil from drier areas such as rocks and artificial structures.

NOAA's Oil Spill Response

Guide to Distinguishing Oil From Algal Blooms

When observed from a boat or aircraft, many kinds of natural phenomena can be mistaken for oil on the water surface. Kelp beds, accumulations of jellyfish, and cloud shadows on the water are sometimes mistaken for oil. Oil spill response experts call such phenomena "false positives." Algal blooms are one kind of false positive. They are sometimes reported as oil on the water, even by trained and experienced observers. This document describes algal blooms and provides tips to help you avoid mistaking algal blooms for oil.

Noctiluca blooms

Algal blooms happen naturally when some kinds of microscopic algae multiply quickly to form visible patches on the water surface. *Noctiluca* is a common, non-toxic alga that forms red, tomato soup-like blooms in the Gulf of Mexico. A *Noctiluca* bloom can look similar to the reddish emulsified oil originating from the Deepwater Horizon wellhead.

Noctiluca *bloom in Hood Canal, Washington State. (Credit: University of Washington)*

Algal blooms can develop when nutrients become plentiful and other growing requirements (light, temperature, and salinity) are met. The Mississippi and Atchafalaya Rivers bring nutrient-rich water to the Gulf of Mexico, providing especially favorable conditions for blooms of *Noctiluca* and other species of algae from spring until the hurricane season.

Distinguishing *Noctiluca* from oil

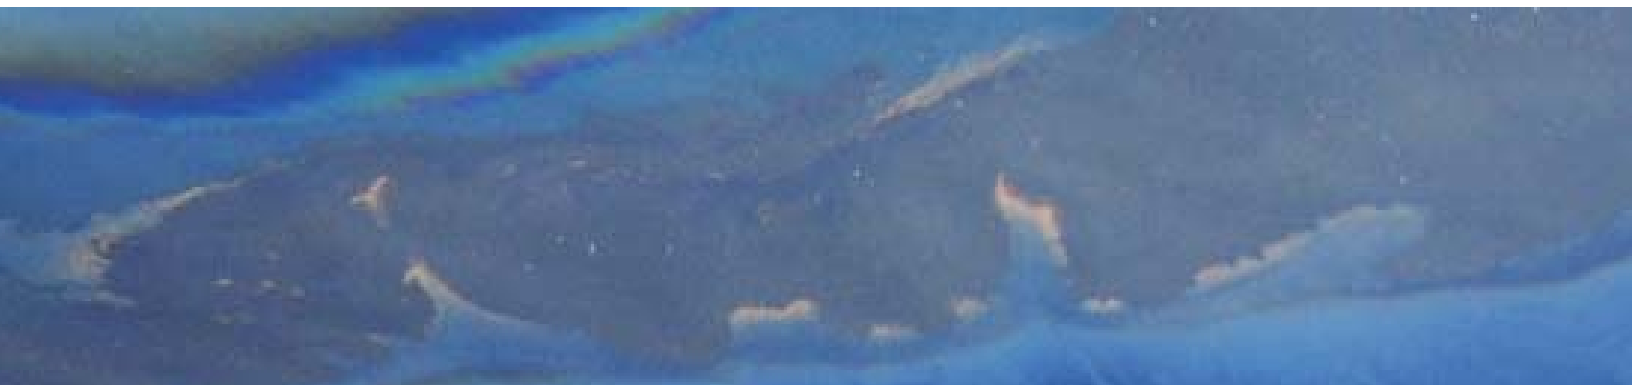
If You're Observing From a Vessel, Aircraft, or the Shore

If you see a reddish patch on the water surface, look for these clues:

1. **Pattern**: A patch of oil tends to appear streaky, or oil may appear as rows of streamers. Algae and water weeds tend not to appear streaky, but instead appear as an amorphous mass. Oil that has emulsified (mixed with water to form an emulsion) typically either has no texture, or appears streaky.

Emulsified oil from the Deepwater Horizon appears as reddish streaks on the water. (Credit: USCG)

continued on back



2. **Sheen**: If you observe a dark or reddish patch on the water surface from an aircraft or vessel, look for sheen around it. Sheen is a very thin film of oil on the water that may be brown, silvery, rainbow-colored, or transparent. Sheen is usually present around patches of thicker oil on the water. You may see small quantities of colorless, sheen-like biofilm around algal blooms, but oil usually produces stronger sheen. Any colored sheen indicates oil (though not all sheen associated with oil is colored).

A streamer of oil is surrounded by rainbow-colored sheen, observed during a May 6 overflight in the Gulf of Mexico. (Credit: USCG)

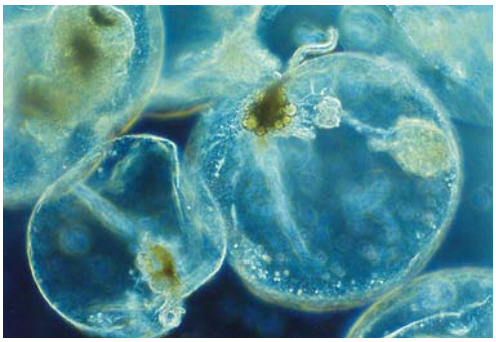
3. **Nighttime luminescence**: *Noctiluca* is bioluminescent: when gently shaken, it produces light from chemical reactions within its cells. Boat crews operating at night may observe glowing stripes or patches on waves, which indicate the presence of *Noctiluca*. Oil does not produce light.

It's possible that in some cases in the Gulf of Mexico, spilled oil may be comingled with algal blooms.

If You Have a Water Sample

Avoid direct contact with substances that could be crude oil, because oil on bare skin can cause mild skin irritation. However, if you have obtained a fresh water sample that you think could contain oil, here are two ways to tell whether the sample contains *Noctiluca* instead, without using a microscope:

1. Pour some of the water into a shallow dish, and inspect it closely. Look for tiny transparent balls somewhat like fish eggs. These balls are very small, less than a tenth of an inch in diameter. If you see them, your sample probably contains *Noctiluca*, and what you're seeing are the mature cells of this tiny algae.



Magnified view of Noctiluca *cells. (Credit: Instituto de Oceanografia, Faculdade Ciências da Universidade de Lisboa)*

2. Take your sample into a completely dark room. Let your eyes adapt for several minutes, and then swirl your sample. Watch for small flashes of light. If you see them, your sample contains *Noctiluca*.

NOAA's Oil Spill Response

Ensuring the Safety of Your Seafood

Crude oil has the potential to taint seafood with flavors and odors imparted by exposure to hydrocarbon chemicals. The U.S. Food and Drug Administration regulates the presence of hydrocarbons as a possible adulterant in seafood.

The public should *not* be concerned about the safety of seafood they are buying at this time. The federal and state governments have strong systems in place to test and monitor seafood safety and to prohibit harvesting from affected areas, keeping oiled products out of the market.

NOAA Fisheries is working closely with the U.S. Food and Drug Administration and the states to ensure seafood safety. If managers determine that seafood may be affected, the next step is to assess whether seafood is tainted or contaminated to levels that could pose a risk to human health through consumption. NOAA conducts a combination of both sensory analysis (of tissue) and chemical analysis (of water, sediment, and tissue) to determine if seafood is safe following an oil spill. The results will be made public as soon as possible.

Seafood Inspection Program

The NOAA Seafood Inspection Program has often been called upon to perform screening and training tasks following major oil spills such as the 1989 *Exxon Valdez* spill in Alaska; 1996 spill in Rhode Island; 1999 spill in Coos Bay, Oregon; and several spills in San Francisco including the most recent in 2007.

Program experts perform sensory analysis to detect oil contamination. The results are compared with the results of chemical analysis conducted by NOAA's National Seafood Inspection Laboratory in Mississippi or its Science Centers.

In response to the current oil spill, the program is implementing a plan of operation to assist both industry and government to determine the extent of contamination in seafood. The program can mobilize staff to train state inspection personnel and industry on sensory analysis techniques to expand the detection capabilities. Depending upon the scope of the problem, it is often best to train a base of state or local industry personnel in the affected area rather than continue to have federal inspectors perform the routine analysis.

(continued on back)

The mission of the NOAA Seafood Inspection Program is to ensure the safety and quality as well as enhance the marketability and sustainability of seafood products for the benefit of the American consumer by providing science-based inspection services to the seafood industry.

The program is voluntary and fee-for-service to provide professional inspection services to ensure compliance with food safety and quality regulations. It is the only federal program with authority to bestow the U.S. "Grade A" mark for eligible products that meet exceptional quality standards.

Inspection Offices

The NOAA Seafood Inspection Program can assist with all seafood inspection needs. Contact one of our regional offices about services in your area.

NOAA's Oil Spill Response

Oil Spill Dispersant Application and Monitoring

Once oil has spilled, responders use a variety oil spill countermeasures to reduce the adverse effects of spilled oil on the environment. Dispersants are one kind of countermeasure.

Oil spill dispersants are chemicals applied directly to the spilled oil in order to remove it from the water surface. Surface oil can be especially harmful to birds, mammals and other organisms that come in contact with the water surface.

Oil on the surface is often cohesive and natural degradation processes are slow. When dispersants are applied to surface oil slicks, tiny dispersant-oil droplets then separate from the slick and mix into the water column, reducing the size and volume of the surface slick.

The tiny droplets are too small to refloat to the surface. Bacteria and other microscopic organisms then act to quickly degrade the oil. Dispersants are commonly applied through specialized equipment mounted on an airplane, helicopter or ship.

Monitoring

Special Monitoring of Applied Response Technologies (SMART) is a cooperatively designed monitoring program for dispersant use. SMART relies on small, highly mobile teams that collect real-time data using portable, rugged and easy-to-use instruments.

The SMART program is designed to address critical questions:

Are dispersants effective in dispersing the oil? How quickly are dispersants working? Having monitoring data can assist the Unified Command with decision-making for operational use of dispersants.

Dispersants

To monitor the efficacy of dispersant application, SMART recommends three options, or Tiers.

Tier I

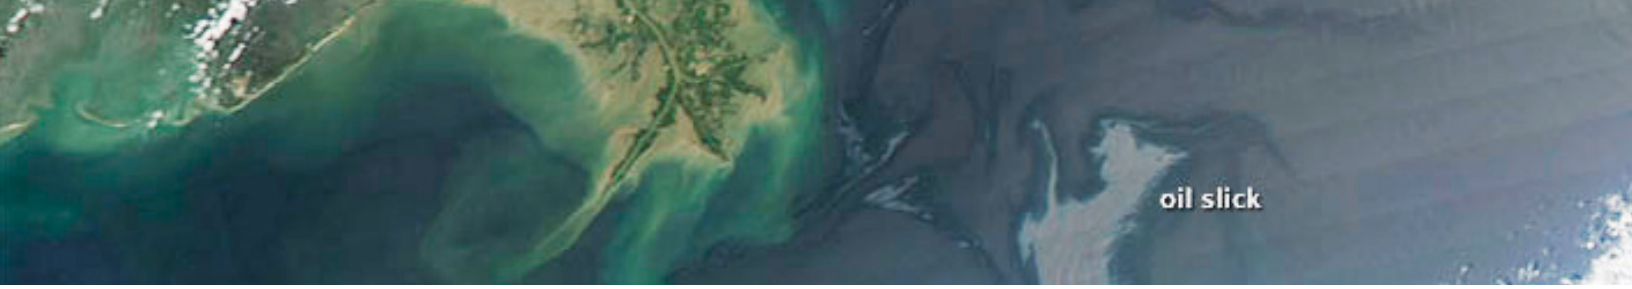
A trained observer, flying over the oil slick and using photographic job aids or advanced remote sensing instruments, assesses dispersant efficacy and reports back to the Unified Command.

Tier II

Tier II provides real-time data from the treated slick. A sampling team on a boat uses a fluorometer to continuously monitor for dispersed oil one meter under the dispersant-treated oil slick.

The team records and conveys fluorometer data to the scientific support team, which forwards it with recommendations to the Unified Command. Water samples are also taken for later analysis at a laboratory.

(continued on back)



Tier III

By expanding the monitoring efforts in several ways, Tier III provides information on where the dispersed oil goes and what happens to it: (1) two fluorometers are used on the same vessel to monitor at two water depths; (2) monitoring is conducted in the center of the treated slick at several water depths, from one to ten meters; and (3) a portable water laboratory provides data on water temperature, pH, conductivity, dissolved oxygen, and turbidity.

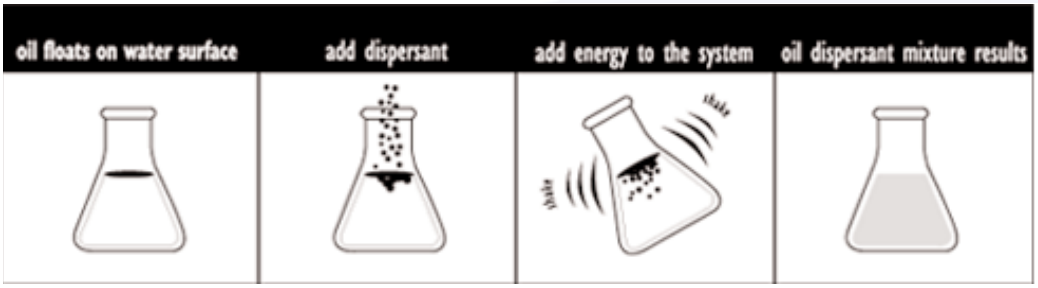
Field Experience

SMART has already been successfully tested in the field during exercises and spills. SMART has been used to monitor dispersant applications in the Gulf of Mexico. Practical usage help us to enhance SMART protocols and equipment.

For online information on SMART, visit http://response.restoration.noaa.gov/smart

Learn more about NOAA's response to the BP oil spill at http://response.restoration.noaa.gov/deepwaterhorizon.

To learn more about NOAA, visit http://www.noaa.gov.



First, the dispersant is applied to the water surface. Next, molecules of the dispersant attach to the oil, causing it to break into droplets. Wave action and turbulence then force the oil-dispersant mixture into the water column, so that the oil that had been concentrated at the surface is diluted within the water column.

NOAA NATIONAL OCEANIC AND ATMOSPHERIC ADMINISTRATION
UNITED STATES DEPARTMENT OF COMMERCE

Potentially Polluting Shipwrecks

The past century of commerce and warfare has left a legacy of thousands of sunken vessels along the US coast. Many of these wrecks pose environmental threats because of the hazardous nature of their cargoes, presence of munitions, or because of bunker fuel oils left onboard. As these wrecks corrode and decay, they may release oil or hazardous materials. Although a few, such as USS *Arizona* in Hawaii, are well-publicized environmental threats, most wrecks, unless they pose an immediate pollution threat or impede navigation, are left alone and are largely forgotten until they begin to leak.

Recent incidents, however, have heightened concerns about the potential environmental hazard posed by shipwrecks. In 2002, for example, the decaying wreck of S.S. *Jacob Luckenbach* was identified as the source of mysterious, recurring oil spills that had killed thousands of seabirds and other marine life along California's coast. The National Oceanic and Atmospheric Administration (NOAA) joined with the U.S. Coast Guard (USCG) and other agencies in operations to remove the approximately 100,000 gallons of oil remaining in the wreck.

Growing Interest in the Problem:

The public has long been captivated by shipwrecks, and there is growing interest in the environmental impacts these wrecks may have. Dozens of stories have been written about the problems associated with leaking WWII-era ships lost in both the Pacific and Atlantic Oceans.

There is also increasing interest from both government and industry to systematically identify, investigate and potentially lighter wrecks before they begin to leak. The Marine Technology Society published special proceedings in 2004 focusing on such underwater pollution threats, and the 2005 International Oil Spill Conference furthered the discussion within government agencies and with the response and salvage industries. Much of the interest is because of the cost and limited effectiveness of emergency response. Removal of oil while it is contained within a wreck can be planned and managed more cost-effectively than a reactive emergency spill response while at the same time preventing impacts to surrounding habitats and sensitive natural resources.

An Example: S.S. *Princess Kathleen*:

On September 7, 1952, S.S. *Princess Kathleen* ran aground on Pt. Lena just outside Auke Bay near Juneau, Alaska and sank. The wreck had been a source of periodic releases ever since. In 2010, the USCG, with scientific support from NOAA, contracted removal of approximately 130,000 gallons of heavy fuel oil and an additional 220,000 gallons of oily water from the wreck.

S.S. *Princess Kathleen* aground on Lena Point, Alaska.

2010-2011 Activities:

The 2010 NOAA budget included a one-time appropriation of $1 million for the Office of Response and Restoration, working jointly with the Office of National Marine Sanctuaries, to solicit a one-time independent assessment of potential manmade undersea threats that could impact coastal

and Great Lakes States. In 2010, NOAA hosted the International Corrosion Workshop, which brought together experts from the fields of oil spill response, military munitions response, and historic preservation to compare how marine corrosion affects each field and to leverage technologies and experience necessary for threat remediation and preservation of historic materials.

Potential Scope of Problem:

There are approximately 20,000 known wrecks in US waters. Most are old and do not pose a threat because they did not use oil as fuel or carry it as cargo. Some more recent wrecks, however, are known to be relatively intact, and based on accident investigation reports and cargo records are believed to contain oil.

How Many Really Contain Oil?

Initial evaluations of shipwrecks located within American waters found that approximately 600-1000 wrecks could pose a substantial pollution threat based on their age, type and size. This includes vessels sunk after 1891 (when vessels began being converted to use oil as fuel), vessels built of steel or other durable material (wooden vessels have likely deteriorated), cargo vessels over 1000 gross tons (smaller vessels would have limited cargo or bunker capacity), and any tank vessel. Additional ongoing research has revealed that the actual number of wrecks posing a potential pollution threat is probably closer to 100 due to the violent nature in which some ships sank and the structural reduction and demolition of those that were navigational hazards.

Moving Forward:

Given the number of potential targets and the modest funding level, it is crucial that the archival research and risk assessment continue to focus on wrecks that are most likely to contain harmful quantities of oil. NOAA is working with the USCG and other interested stakeholders to identify and collect additional information about those wrecks with the greatest pollution potential, with the overall goal of conducting a risk assessment and preparing a prioritized list of threats based on vessel contents, condition, environmental sensitivity, and other factors.

NOAA's Emergency Response Capabilities:

Thousands of incidents occur each year in which oil or chemicals are released into the environment as a result of accidents or natural disasters. Spills into our coastal waters, whether accidental or intentional, can harm people and the environment and cause substantial disruption of marine transportation with potential widespread economic impacts. NOAA provides scientific expertise to support an incident response and initiates natural resource damage assessment. This integrated approach provides for an efficient and effective response, minimizing the harm to people, reducing the negative impacts to the economy and enhancing environmental recovery.

NOAA's Oil Spill Response

Shoreline Cleanup and Assessment Technique

Shoreline Cleanup and Assessment Technique (SCAT) is a simple and comprehensive way to perform a survey of an affected shoreline. This systematic approach uses standardized terminology to collect data on shoreline oiling conditions and supports decision-making for shoreline cleanup. SCAT is flexible in its scale of surveys and in the detail of data sets collected.

SCAT is part of the response, and outpaces operations. This process continues past the initial assessment to verify cleanup effectiveness and conduct final evaluations. The SCAT process uses eight steps:

1) Conduct reconnaissance survey
2) Segment the shoreline
3) Assign teams and conduct shoreline surveys
4) Develop cleanup guidelines and endpoints
5) Submit reports and sketches to Planning Section
6) Monitor effectiveness of cleanup
7) Post cleanup inspections
8) Do final evaluation of cleanup activities

SCAT Team

SCAT teams use team members who are trained in techniques, procedures, and terminology of shoreline assessment. Team members have a thorough understanding of the response goals and objectives and will consider safety concerns in cleanup recommendations.

Although they coordinate with division supervisors in the area, they do not direct cleanup workers.

SCAT teams collect data using a collaborative consensus-building approach. SCAT team members also prepare field maps and forms detailing the area surveyed and make specific cleanup recommendations. Team members verify the effectiveness of cleanup, modifying guidelines as needed if conditions change.

SCAT Team Responsibilities

- Evaluate oiling conditions
- Factor in shoreline types
- Identify sensitive resources
- Determine need for cleanup
- Recommend cleanup methods and endpoints
- Place constraints on cleanup if necessary, due to ecological, economic, or cultural concerns

SCAT Coordinator

The SCAT coordinator directs the activities of the SCAT teams. The SCAT coordinator is also involved with pre-SCAT planning, team calibration, and coordination with planning and operations sections on cleanup recommendations. In addition, the coordinator provides information to situation and documentation units.

(continued on back)

Members of a SCAT team may include:

- Federal representative (usually NOAA Scientific Support Team or Coast Guard)
- State representative
- Responsible Party representative
- Landowner or other stakeholder

Small Diesel Spills (500-5000 gallons)

Small Diesel Spills (500-5000 gallons)

Diesel fuel is most often a light, refined petroleum product. Small diesel spills will usually evaporate and disperse within a day or less. This is particularly true for typical spills from a fishing vessel (500-5,000 gallons), even in cold water. Thus, seldom is there any oil on the surface for responders to recover. However, what is commonly referred to as "marine diesel" is often a heavier intermediate fuel oil that will persist longer when spilled. When spilled on water, diesel oil spreads very quickly to a thin film of rainbow and silver sheens except for marine diesel, which may form a thicker film of dull or dark colors.

Characteristics of Small Diesel Spills (500-5000 gallons)

- Diesel oil has a very low viscosity and is readily dispersed into the water column when winds reach 5-7 knots or with breaking waves.
- Diesel oil is much lighter than water (specific gravity is between 0.83 and 0.88), compared to 1.03 for seawater). It is not possible for this oil to sink and accumulate on the seafloor as pooled or free oil unless adsorption occurs with sediment.
- However, it is possible for the diesel oil that is dispersed by wave action, to form droplets that are small enough be kept in suspension and moved by the currents.
- Oil dispersed in the water column can adhere to fine-grained suspended sediments(adsorption) which then settle out and get deposited on the seafloor. This process is more likely to occur near river mouths where fine-grained sediment are carried in by rivers. It is less likely to occur in open marine settings. This process is not likely to result in measurable sediment contamination for small spills.
- Diesel oil is not very sticky or viscous, compared to black oils. When small spills do strand on the shoreline, the oil tends to penetrate porous sediments quickly, but also tend to be washed off quickly by waves and tidal flushing. Thus, shoreline cleanup is usually not needed.
- Diesel oil is readily and completely degraded by naturally occurring microbes, under time frames of one to two months.
- In terms of toxicity to water-column organisms, diesel is considered to be one of the most acutely toxic oil types. Fish, invertebrates and seaweed that come in direct contact with a diesel spill may be killed. However, small spills in open water are so rapidly diluted that fish kills have never been reported. Fish kills have been reported for small spills in confined, shallow water.
- Crabs and shellfish can be tainted from small diesel spills in shallow, nearshore areas. These organisms bioaccumulate the oil, but will also depurate the oil, usually over a period of several weeks after exposure.
- Small diesel spills can affect marine birds by direct contact, though the number of birds affected is usually small because of the short time the oil is on the water surface. Mortality is caused by ingestion during preening as well as to hypothermia from matted feathers. Experience over the last 10 years in Alaska, with hundreds of small diesel spills, is that few birds are directly affected by diesel spills from fishing vessels. However, small spills could result in serious impacts to birds under the "wrong" conditions, such as a grounding right next to a large nesting colony or transport of sheens into a high bird concentration area.

Small Diesel Spills (500-5000 gallons)

Over 90% of the diesel in a small spill incident into the marine environment is either evaporated or naturally dispersed into the water column in time frames of a couple of hours to a couple of days. Percent ranges, in parentheses above, represent effects of winds ranging from 5 to 30 knots.

Adsorption (sedimentation) The process by which one substance is attracted to and adheres to the surface of another substance without actually penetrating its internal structure

Biodegradation The degradation of substances resulting from their use as food energy sources by certain micro-organisms including bacteria, fungi, and yeasts

Dispersion The distribution of spilled oil into the upper layers of the water column by natural wave action or application of chemical dispersants

Dissolution The act or process of dissolving one substance in another

Emulsification The process whereby one liquid is dispersed into another liquid in the form of small droplets

Evaporation The process whereby any substance is converted from a liquid state to become part of the surrounding atmosphere in the form of a vapor

Photo Oxidation Sunlight-promoted chemical reaction of oxygen in the air and oil

NOAA's Oil Spill Response

Special Monitoring of Applied Response Technologies

Special Monitoring of Applied Response Technologies (SMART) is a cooperatively designed monitoring program for on site burning and dispersants. SMART relies on small, highly mobile teams that collect real-time data using portable, rugged, and easy-to-use instruments during dispersant and on site burning operations.

Data are channeled to the Unified Command to address critical questions: Are dispersants effective in dispersing the oil? Are particulates concentration trends at sensitive locations exceeding the level of concern? Having monitoring data can assist the Unified Command with decision-making for dispersant and on site burning operations.

The SMART Way

Dispersants

To monitor the efficacy of dispersant application, SMART recommends three options, or tiers.

Tier I

A trained observer, flying over the oil slick and using photographic job aids or advanced remote sensing instruments, assesses dispersant efficacy and reports back to the Unified Command.

Tier II

Tier II provides real-time data from the treated slick. A sampling team on a boat uses a fluorometer to continuously monitor for dispersed oil one meter under the dispersant-treated slick. The team records and conveys fluorometer data to the Scientific Support Team, which forwards it with recommendations to the Unified Command. Water samples also are taken for later analysis at a laboratory.

Tier III

By expanding the monitoring efforts in several ways, Tier III provides information on where the dispersed oil goes and what happens to it: (1) two fluorometers are used on the same vessel to monitor at two water depths; (2) monitoring is conducted in the center of the treated slick at several water depths, from one to ten meters; and (3) a portable water laboratory provides data on water temperature, pH, conductivity, dissolved oxygen, and turbidity.

On Site Burning

For on site burning operations, SMART recommends deploying one or more monitoring teams downwind of the burn at sensitive locations such as population centers. The teams begin sampling before the burn begins to collect background data.

(continued on back)

After the burn starts, the teams continue sampling for particulate concentration trends, recording them both manually at fixed intervals and automatically in the data logger, and reporting to the Monitoring Group Supervisor if the level of concern is exceeded. The Scientific Support Team forwards the data, with recommendations, to the Unified Command.

Field Experience

SMART has already been successfully tested in the field. SMART was used to monitor dispersant applications in the Gulf of Mexico, and in February 1999 it was used to monitor the on site burning of the *New Carissa* off Coos Bay, Oregon. Spills and exercises like these help us to enhance SMART.

NOAA's Oil Spill Response

Surface Washing Agents

Surface washing agents are liquid products designed to make it easier to remove oil from surfaces and structures that have been oiled so that they don't become "secondary sources" of pollution.

Thirty-three surface washing agents are currently listed on the National Contingency Plan Product Schedule, an EPA list of products that have met basic requirements for being considered for use in an oil spill response. Approval from the Regional Response Team is needed before a surface washing agent can be used in a manner that would cause it to be released to the environment.

When Surface Washing Agents are Used

Surface washing agents are used to soften and lift oil off of surfaces or structures that have been oiled, such as beach rocks, rock platforms, artificial structures, and riprap. Typically, conventional cleanup methods are used first to the extent of their utility (e.g., removal of gross oiling).

Surface washing agents also are used to clean and decontaminate response equipment and, less often, vessels that have been oiled. For example, in 2001, the M/V *Genmar Hector* (left) was cleaned with surface washing agents after its hull and superstructure were oiled.

Surface washing agents typically act relatively quickly and can be used on all types of oil. The application methods vary but the agents are typically sprayed on the oiled surface, allowed to soak 5 to 15 minutes, followed by a warm water/high pressure wash.

How They Work

Surface washing agents contain surfactants, solvents, and/or other additives that soften and lift oil off the surface. There are two main types. "Lift and float" products lift oil from the surface so it floats on the water as a slick and can be recovered. Booms, sorbents, and vacuum pumps are often used with these products to collect and recover the oil. "Lift and disperse" products act like detergents to lift oil off surfaces, emulsify it (break it into fine droplets), and disperse it into the water.

Because it's not possible to recover the oil directly when using this type of product, responders must contain and recover the washwater.

Example Surface Washing Agents

Corexit 9580 and PES-51are both "lift and float" surface washing agents. PES-51 is composed mainly of surfactants and d-limonene, a chemical with a lemon-like odor produced naturally by citrus plants and some coniferous trees. PES-51 has been used or tested at many oil spills. A good summary of surface washing agents can be found at http://www.nrt.org/Production/NRT/RRTHome.nsf/resources/RRT%20IV%20Meeting%20Summaries/$file/SurfaceWashingAgents.pdf.

NOAA's Oil Spill Response

Understanding Tar Balls

What are Tar Balls and How Do They Form?

Tar balls, the little, dark-colored pieces of oil that stick to our feet when we go to the beach, are actually remnants of oil spills. When crude oil (or a heavier refined product) floats on the ocean surface, its physical characteristics change.

During the first few hours of a spill, the oil spreads into a thin slick. Winds and waves tear the slick into smaller patches that are scattered over a much wider area. Various physical, chemical, and biological processes change the appearance of the oil. These processes are generally called "weathering."

Initially, the lighter components of the oil evaporate much like a small gasoline spill. In the cases of heavier types of oil, such as crude oil or home heating oil, much of the oil remains behind. At the same time, some crude oils mix with water to form an emulsion that often looks like chocolate pudding.

This emulsion is much thicker and stickier than the original oil. Winds and waves continue to stretch and tear the oil patches into smaller pieces, or tar balls. While some tar balls may be as large as pancakes, most are coin-sized. Tar balls are very persistent in the marine environment and can travel hundreds of miles.

How Long Will Tar Balls Remain Sticky?

Weathering processes eventually create a tar ball that is hard and crusty on the outside and soft and gooey on the inside, not unlike a toasted marshmallow. Turbulence in the water or beach activity from people or animals may break open tar balls, exposing their softer, more fluid centers.

Scientists have not been very successful at creating weathered tar balls in the laboratory and measuring the thickness of the crusty outer layer. Therefore, we don't know how much energy is needed to rupture a tar ball.

We do know that temperature has an important effect on the stickiness of tar balls. As air and water temperatures increase, tar balls become more fluid and, therefore, sticky — similar to an asphalt road warmed by the summer sun.

Another factor influencing stickiness is the amount of particulates and sediments present in the water or on the shoreline, which can adhere to tar balls. The more sand and debris attached to a tar ball, the more difficult it is to break the tar ball open. These factors make it extremely difficult to predict how long a tar ball will remain sticky.

(continued on back)

Are Tar Balls Hazardous to Your Health?

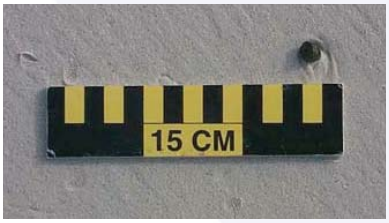
For most people, an occasional brief contact with a small amount of oil, while not recommended, will do no harm. However, some people are especially sensitive to chemicals, including the hydrocarbons found in crude oil and petroleum products. They may have an allergic reaction or develop rashes even from brief contact with oil. In general, we recommend that contact with oil be avoided.

If contact occurs, wash the area with soap and water, baby oil, or a widely used, safe cleaning compound such as the cleaning paste sold at auto parts stores. Avoid using solvents, gasoline, kerosene, diesel fuel, or similar products on the skin. These products, when applied to skin, present a greater health hazard than the smeared tar ball itself.

Tar Ball Bits and Pieces

Beach Cleanup

There is no magic trick to making tar balls disappear. Once tar balls hit the beaches, they may be picked up by hand or by beach-cleaning machinery. If the impact is severe, the top layer of sand containing the tar balls may be removed and replaced with clean sand.



Are there more tar balls on beaches along the East Coast than on the West Coast?

The number of tar balls found on the beach depends on several factors: tanker traffic, wind patterns, sea currents, whether an oil spill occurred recently, and how often the beach is cleaned.

Obviously, some beaches may have more tar balls than others, but to our knowledge, East Coast beaches are not necessarily more polluted with tar balls than beaches along the West Coast of the United States.

Can Dispersants Cause Tar Balls?

No. Dispersants do the exact opposite- they break oil up into tiny droplets, much smaller than the head of a pin, which do not re-form or re-congeal into a visible mass of oil.

Tar balls are weathered oil that has lost its lighter components. Thus they are denser than fresh oil and closer to the density of seawater. They still float, but in estuarine (less dense) waters like Lakes Pontchartrain and Borgne, they would float very low in the water and be easily entrained by currents, as well as roll under or around booms and barges. They are also widely scattered and may not be noticeable at sea or floating, but may accumulate on shorelines.

Reporting

New tar balls appearing on a beach may indicate an oil spill. If you notice unusual numbers of tar balls on the beaches, call the U. S. Coast Guard any time at 800-424-8802.

Hypothetical Spill Scenario

Collision Closes New York Harbor Channel

-Updated 30 minutes ago-

NEWARK, NJ (AP) -- The Kill Van Kull was closed early this morning after an inbound freighter lost steering and struck a pier. U.S. Coast Guard and Port Officials said the incident occurred around 3 am. The 700-foot freighter, carrying 450,000 gallons of bunker fuel, was holed above the water line and is leaking fuel oil. Authorities are not sure how much of the fuel product has leaked into the water but confirmed that at least three tanks on the vessel are damaged and continue to leak. The Channel will remain closed until the area has been cleaned.

NOAA Office of Response and Restoration

NOAA's Office of Response and Restoration (OR&R) protects coastal and marine resources, mitigates threats, reduces harm, and restores ecological function. The Office provides comprehensive solutions to environmental hazards caused by oil, chemicals, and marine debris.

Thousands of incidents occur annually in U.S. waters where oil or chemicals are released into the environment as a result of accidents or natural disasters. Spills are unpredictable and chaotic events and the initial information may be incomplete or inaccurate. The following questions may help you evaluate spill incidents.

Key questions

Who is the Federal On-Scene Coordinator? 2
Who is the Responsible Party? 3
How much was spilled? How does that compare with other incidents? 4
Uncertainty in spill volumes 5
What type of oil was spilled? 6
Is the release contained or on-going? 7
Is it the actual or potential volume? 8
Is the vessel a tank vessel or non-tank vessel? 9
Is the vessel double-hulled? 10
Double bottom construction 11
What is the tonnage of the vessel? 12
What are the spill units? gallons, barrels, tons? 13
Is the spill in freshwater or seawater? 14
What are the weather conditions? 15
What is the expected spill trajectory? 16
Where is the oil? 17
What resources are at risk? 18
What types of biological effects are anticipated? 19
Are there any closures or restrictions? 20
Will the vessel be moved to a place of refuge? 21
What types of response countermeasures are being used? 22
How much oil has been recovered? 23
How long will the cleanup take? 24
How do claimants get compensated for their losses? 25
How do natural resources get restored? 26
How do I get more information? 27
What if I want to learn more about spills? 28

Who is the Federal On-Scene Coordinator?

Under the NCP, marine and coastal spill responses in the United States are headed by the Coast Guard, who is referred to as the Federal On-Scene Coordinator (FOSC). The EPA has the lead for inland spills. Certain terrestrial and river spills may straddle these jurisdictional boundaries. When a spill occurs, the pre-designated FOSC has the overall responsibility for protecting public health and the environment after a spill. The FOSC has the authority to implement necessary spill response actions including the salvage and lightering of the vessel, closing the port to ship traffic, placement of booms, and other steps to implement the pre-determined response plans.

NOAA, along with a dozen other Federal agencies may provide technical support or assistance, or provide special teams for certain types of incidents. These agencies are coordinated at the national level through the National Response Team (NRT), and at the regional level through13 regional response teams (RRT). The NRT and RRT are policy, planning, and response assistance bodies to the FOSC.

Who is the Responsible Party?

In the event of a vessel oil spill, the responsible party, as defined under OPA 90, is any person owning, operating, or demise chartering the vessel. More than one responsible party may be identified for a single incident in which case each responsible party would be jointly liable. The cargo owner is not considered a responsible party under OPA 90.

The responsible party is required to direct the response and pay all claims. This includes hiring spill response contractors, managing the spill, dealing with claims from property owners and fisherman, and other elements of liability under OPA 90.

Except for major oil companies, most spillers hire contractors to address their OPA responsibilities and the spiller may have very limited visibility during the response. Oil Spill Removal Organizations (OSROs) are commercial vendors of oil spill response services. Response Management Firms provide clients with a Qualified Individual and a Spill Management Team (SMT). The SMT will bring in personnel to staff the command posts and implement the Incident Command System (ICS), including the responsible party's Incident Commander.

Payment of costs and claims is ultimately the function of the spiller's insurance. In the case of vessel spills, most vessel owners have pollution coverage through a Protection and Indemnity Club (P&I Club).

How much was spilled? How does that compare with other incidents?

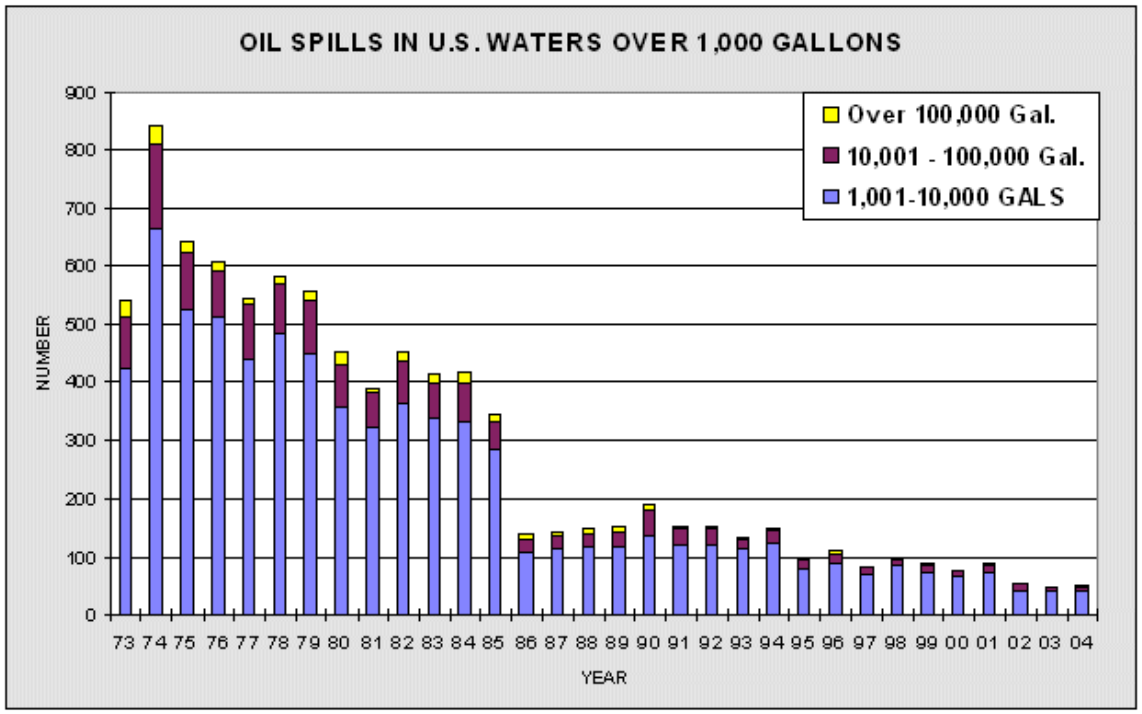
Spill size is one of many factors to consider when evaluating potential for environmental impacts. While an ill-timed oil spill that occurs in a sensitive location, regardless of spill size, can cause devastating damage to natural environments, property, and business, larger spills have the potential for greater harm. The National Contingency Plan categorizes oil spills into three general sizes:

(1) Minor: less than 1,000 gallons in freshwater or 10,000 gallons in marine waters

(2) Medium: 1,000 to 10,000 gallons in freshwater or 10,000 to 100,000 gallons in marine waters.

(3) Major: more than 10,000 gallons in freshwater or 100,000 gallons in marine waters.

Most notable spills fall into the "major" category, including the *Exxon Valdez* in Alaska (11 million gallons), the *DBL 152* in Texas (3.3 million gallons), the *North Cape* in Rhode Island (825,000 gallons), the *Selendang Ayu* in Alaska (337,000 gallons), and the *Athos I* in the Delaware River (264,000 gallons). The *Cosco Busan* spill in San Francisco would fall into the medium category (53,000 gallons), as would the *Bouchard Barge 120* spill in Buzzards Bay, MA (98,000 gallons).



Uncertainty in spill volumes

Estimation of spill volumes is difficult and sometimes contentious. Federal laws require spillers to notify the National Response Center or the nearest USCG unit whenever a spill generates a visible sheen, but there is no requirement that an accurate volume be reported. It is not uncommon for spill volume estimates to change over the course of an incident as more information becomes available.

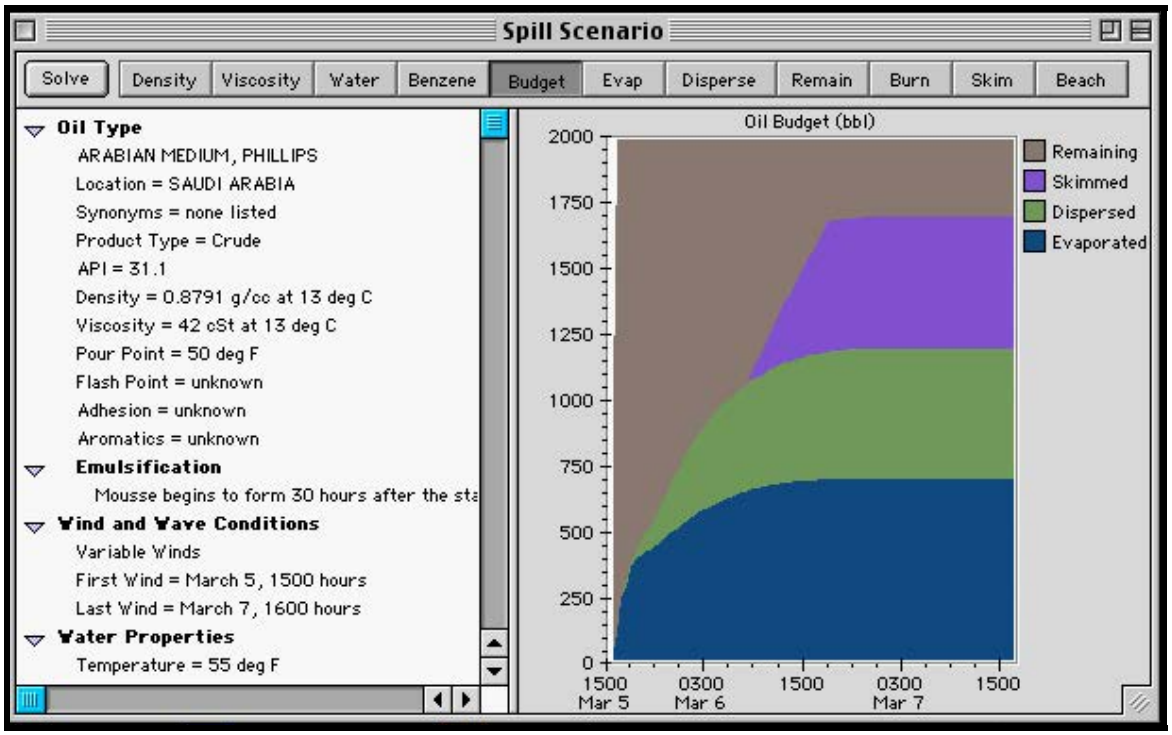
Most spills are small and many are reported as an unknown amount.

What type of oil was spilled?

There are thousands of different types of crude and refined oils. These products can vary significantly in terms of physical and chemical characteristics, which in turn affect the behavior of the oil when spilled, the cleanup strategy, and the toxicity to marine life and human health. Heavy oils may not even flow at room temperature, and some oils are heavier than seawater and therefore sink when spilled. Lighter oil products can evaporate in hours and are sufficiently volatile to create inhalation and fire hazards.

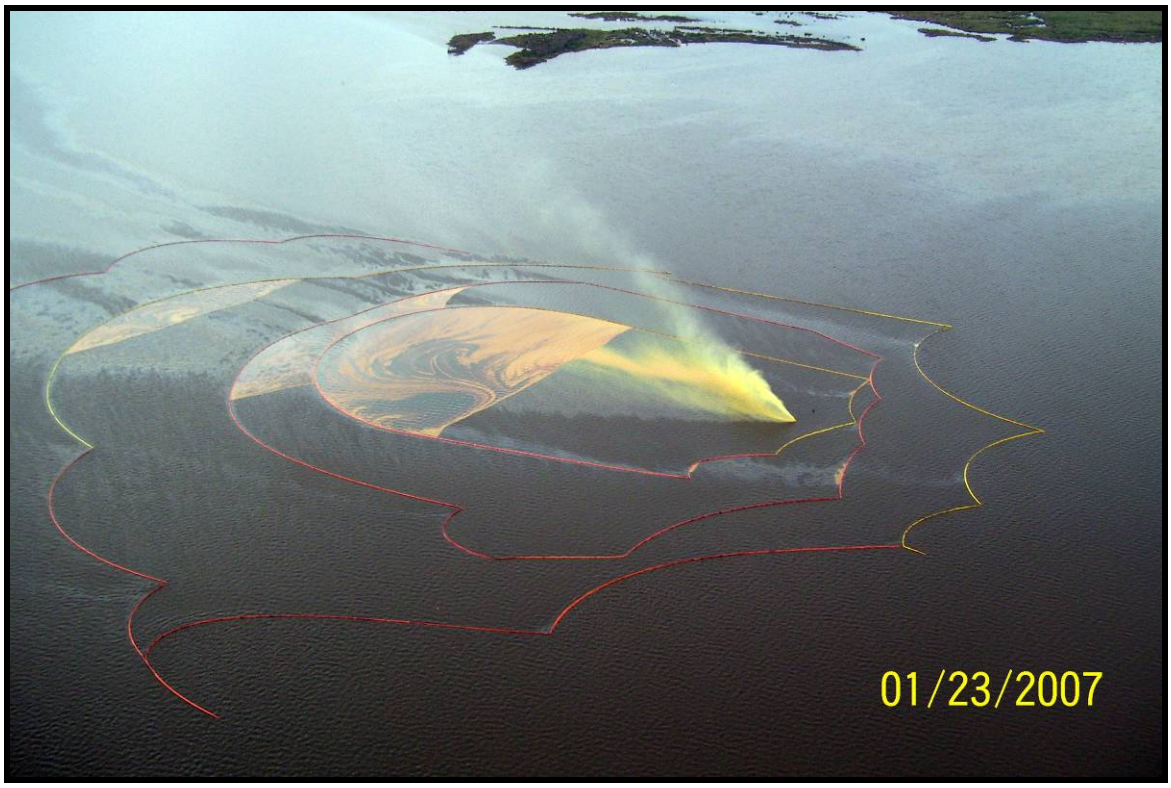
Most large freighters carry a blend of heavy and light fuels, in addition to large amounts of lubricating oil. Smaller non-tank vessels, including tugs and fishing boats, typically use light fuel oils, such as diesel. If spilled, these oil types can have dramatically different fates and effects.

The process of oil degradation in the environment is called weathering. The oil type and environmental conditions greatly affect the weathering process. NOAA developed and maintains an oil weathering model, the Automated Data Inquiry for Oil Spills (ADIOS), which helps responders evaluate the likely behavior of spilled oils and cleanup options. ADIOS integrates a library of approximately one thousand oils.



Is the release contained or on-going?

Oil spills come from a variety of sources, including vessels, facilities, pipelines, railcars, and trucking accidents. Some releases may be essentially instantaneous, while others may persist for days or weeks. Clarifying the nature of the release will help to understand how large and wide-spread the impacts may be. On-going releases may include scenarios such as a leaking pipeline, sunken wreck, or oil well/production platform. In these situations, the spill may be reported as a daily estimated rate.



Production Platform spill in Louisiana. The control valve was sheared off by a passing vessel, resulting in a multi-day release.

Is it the actual or potential volume?

Given the uncertainty in loss calculations and uncertainty whether the vessel can be salvaged, emergency responders may report an estimate of the spill and the potential if the entire cargo or tank was released. Most vessels have multiple fuel tanks, and tank ships and tank barges will have segregated cargo tanks. A tank ship may be designed with 2 or 3 tanks wide, and 5 to 7 tanks long, with 5 x 3 arrangement (15 tanks arranged 3 wide and 5 long) being a common arrangement. Cargo and fuel tanks are not typically evenly-sized and tanks may vary in volume.

The potential volume could be the entire contents of the vessel, or just the contents of the damaged tank(s).

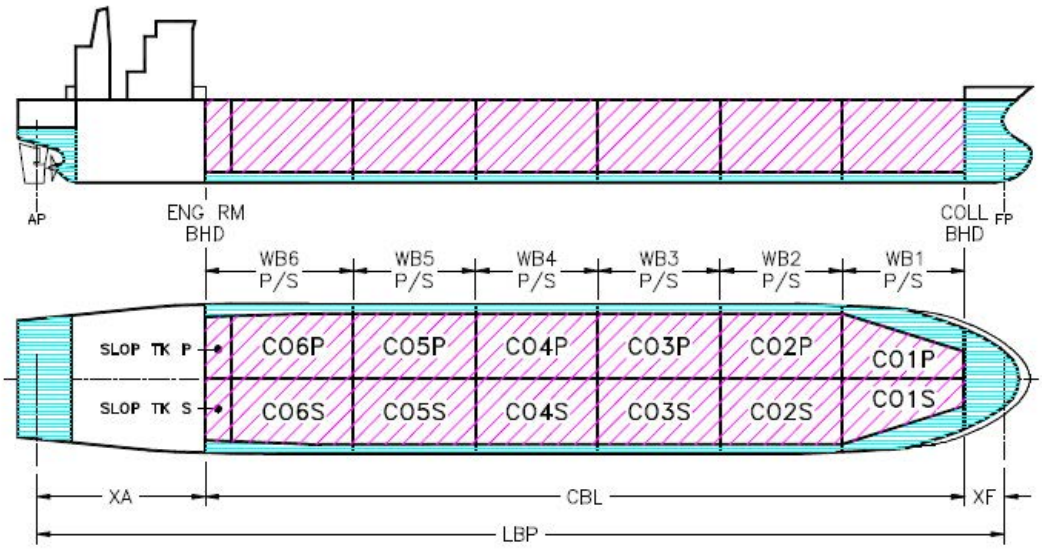


Figure 1
Typical 6x2 Cargo Tank Arrangement

The potential volume could be the entire vessel or just the damaged tank(s).

Is the vessel a tank vessel or non-tank vessel?

OPA 90 makes a distinction between vessels that carry oil in bulk as cargo, such as tankers and tank barges, and vessels that simply carry oil as fuel. This distinction is appropriate due to operational differences in the vessels and the potential varying consequences of a ship casualty.

Knowing the vessel type will help to put bounds on the potential amount spilled. Many early news reports may be incorrect on the type of vessel, and cargo vessels are often confused with tank vessels. Tankers and tank barges carry a substantially greater volume of oil than non-tank vessels.

Tanker Fuel Threatens Alaskan Wilderness Search Suspended for Six Missing Crew Members

By RACHEL D'ORO, AP

ANCHORAGE, Alaska (Dec. 11) - The Coast Guard suspended its search for six people lost for three days in the frigid Bering Sea after the crash of a rescue helicopter that had plucked them from a broken freighter.

Searchers covered 227 miles of coastline and 550 square miles of ocean before suspending the search Friday evening, said Rear Adm. James Olson, commander of the Coast Guard in Alaska.

"There is little hope that any survivor will be found," Olson said.

High wind hampered efforts Friday to stem an oil spill from the `738-foot` Selendang Ayu. The spill is near a wildlife refuge, home to sea lions, harbor seals, sea otters, tanner crabs, halibut and kelp beds.

In this case, the freighter Selendang Ayu was confused with a tanker. The Selendang Ayu carried about 700,000 gallons of fuel oil. A tanker with a tonnage similar to the Selendang would have carried approximately 40 million gallons.

Is the vessel double-hulled?

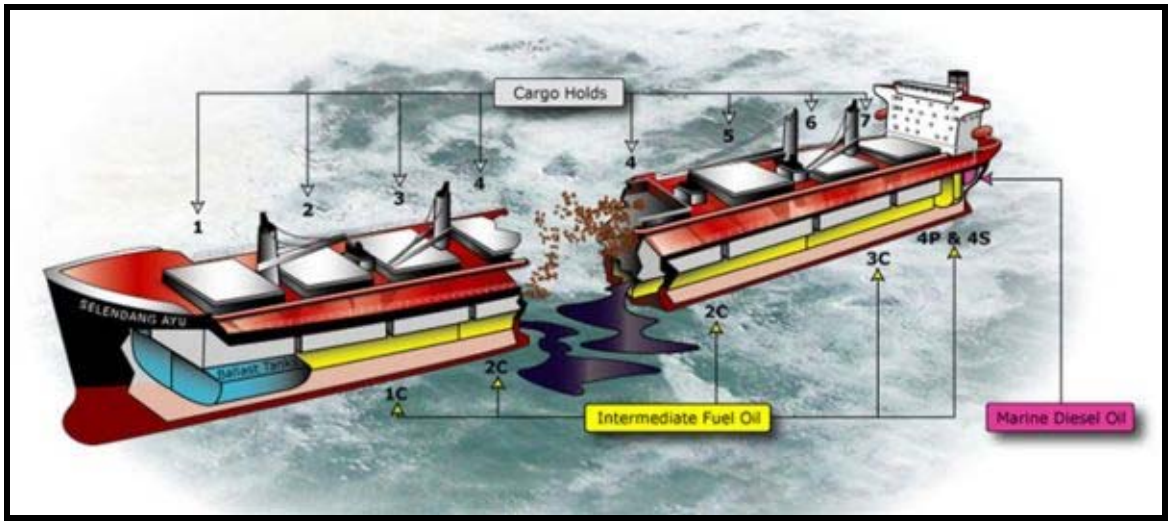
Double hull construction is generally reserved for tank vessels and tank barges. Single hulled tankers and barges are being phased out according to a size and date of construction schedule, with the last single hulls being phased out in 2015.

Double hull construction provides protection during groundings and collisions but the inner hull may be punctured during a severe incident. In these scenarios, the double hull may reduce the number of tanks ruptured and amount of cargo lost.

Cross section of a double-hulled tanker.

Double bottom construction

Double bottom construction is sometimes confused with double hull construction. Large commercial freighters are single hulled, but are built with a double bottom. This construction allows for a flat floor in the cargo holds. Otherwise, the cargo hold would have numerous longitudinal and lateral frames running along the bottom of the hold, making it difficult to unload bulk cargos. These frames are covered with steel plate making a flat floor. The void space below is then used for carrying ballast and fuel. Fuel carried in these tanks is particularly vulnerable to grounding damage.



Double bottom tanks on the Freighter Selendang Ayu.

What is the tonnage of the vessel?

Since vessels vary significantly in design, vessel size is scaled in tonnage rather than length. In the maritime field, there are several tonnage measures, including Gross Tonnage, Net Tonnage, Deadweight Tonnage, and Light Weight Tonnage. For the purposes of OPA 90, Gross Tonnage, or the measure of the internal capacity of a vessel is the standard metric. This tonnage is not a weight, but is instead a volume measurement of the ability of a vessel to carry cargo. This includes both cargo spaces on the ship and other enclosed areas of the vessel, exempting some space such as living quarters. Many of the regulatory requirements under OPA 90, including safety and manning rules and liability limits, are either triggered by a vessel size, or scaled by vessel size, with larger vessels having greater requirements and greater potential liabilities.

Liability rates are triggered by the type (tank or non-tank), hull type (single hull or double hull) and tonnage of the vessel. Rates established under OPA 90 were raised in 2006.

If the vessel is a. . .	The original limit of liability limit was the greater of. . .	And the amended limits of liability are the greater of. . .
Tank vessel greater than 3,000 gross tons with a single hull, double sides only, or double bottom only	$1,200 per gross ton or $10,000,000	$3,000 per gross ton or $22,000,000.
Tank vessel less than or equal to 3,000 gross tons with a single hull, double sides only, or double bottom only	$1,200 per gross ton or $2,000,000	$3,000 per gross ton or $6,000,000.
Tank vessel greater than 3,000 gross tons with a double hull	$1,200 per gross ton or $10,000,000	$1,900 per gross ton or $16,000,000.
Tank vessel less than or equal to 3,000 gross tons with a double hull	$1,200 per gross ton or $2,000,000	$1,900 per gross ton or $4,000,000.
Any vessel other than a tank vessel	$600 per gross ton or $500,000	$950 per gross ton or $800,000.

Original and amended liability limits under OPA 90

What are the spill units? gallons, barrels, tons?

Oil is measured in a number of different units, with cargo often measured in barrels, and with fuel measure in tons. Vessel operators and production facilities rarely report volumes in gallons, but spill volumes are often converted to gallons for public reporting. This can create confusion, and newspaper reporters may sometimes incorrectly report units.

Approximate Conversions:
1 gallon is 3.785 liters
1 Barrel (bbl) is 42 gallons
1 Metric Ton is 1000 liters, or 264 gallons, or 6.3 barrels.

Understanding the general capacity of various sized vessels can help evaluate whether the units are questionable. For example, in the situation below, a 65,000 gallon capacity would be very small for a tank barge. In this situation, the actual volume was 65,000 barrels, or 2.7 million gallons.

Oil Barge Strikes SF Bay Bridge in Fog

7 hours ago

SAN RAFAEL, Calif. (AP) — A barge carrying oil struck a bridge in the San Francisco Bay, but there were no immediate reports of oil spilling into the bay, authorities said.

The U.S. Coast Guard said a tugboat was pulling the barge under the Richmond-San Rafael Bridge in foggy conditions Thursday evening when the barge hit a piling. Authorities were investigating the cause.

The barge has a capacity of more than 65,000 gallons of oil, but Coast Guard officials said no oil or other pollution was released into the bay.

The crash came about two months after a container ship struck a support on the San Francisco-Oakland Bay Bridge tower, spilling 58,000 gallons of oil into the bay. The spill killed thousands of birds and closed more than a dozen beaches.

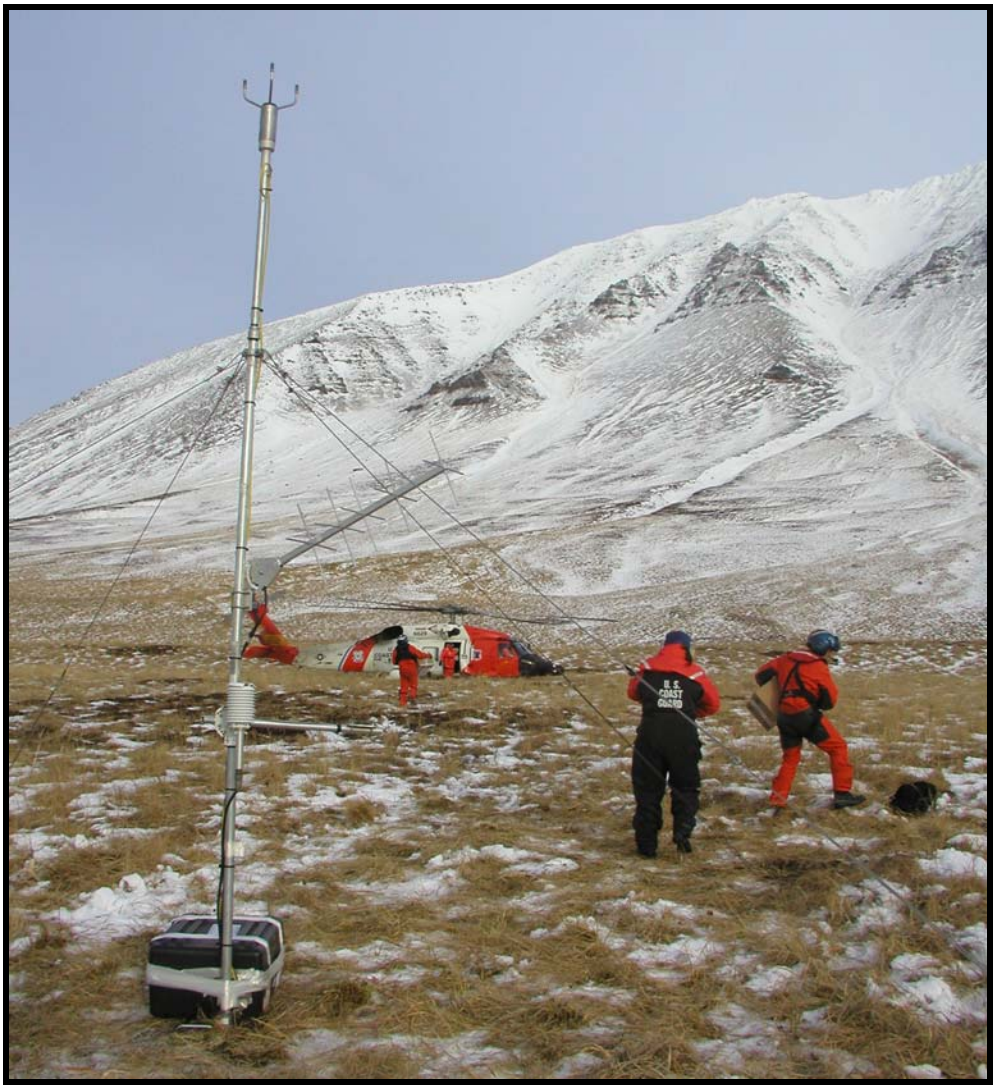
Is the spill in freshwater or seawater?

Spills in freshwater may have longer-term impacts because oil is often contained rather than naturally dispersed. Certain oils that float in seawater may sink in freshwater. Freshwater resources may be more significant in terms of industrial and municipal uses. Spills in estuaries may exhibit complicated behaviors because of the confluence of river and tidal currents and mixing of waters of varied densities.

Red-dyed diesel in a river in Virginia.

What are the weather conditions?

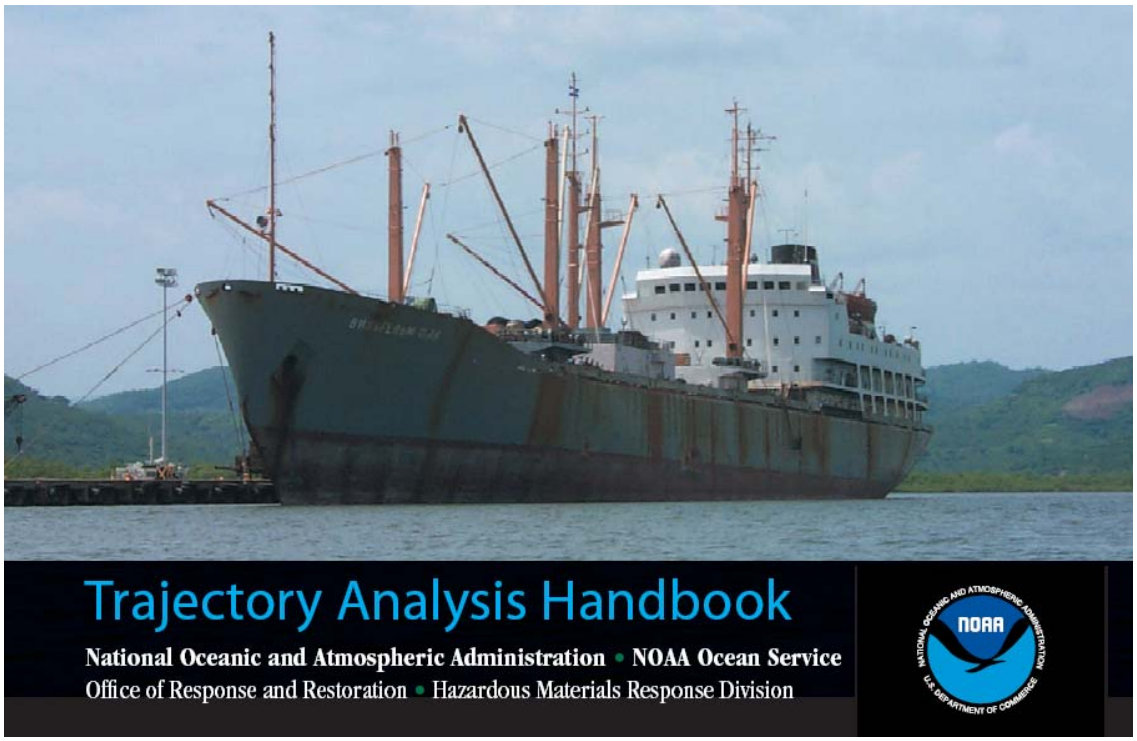
Weather and oceanographic conditions have a major role in the outcome of an incident, including the fate of the spilled oil, the success of salvage, the feasibility and effectiveness of certain response alternatives, and safety of the response efforts. NOAA provides site-specific weather forecasts to the Unified Command, including marine and aviation forecasts, to assist in operational decision-making. When requested, NOAA can install remote weather stations and supply an Incident Meteorologist to provide real-time information in the command post.



USCG and NOAA setting up a remote weather station near the wreck of the Selendang Ayu, Unalaska Island, Alaska.

What is the expected spill trajectory?

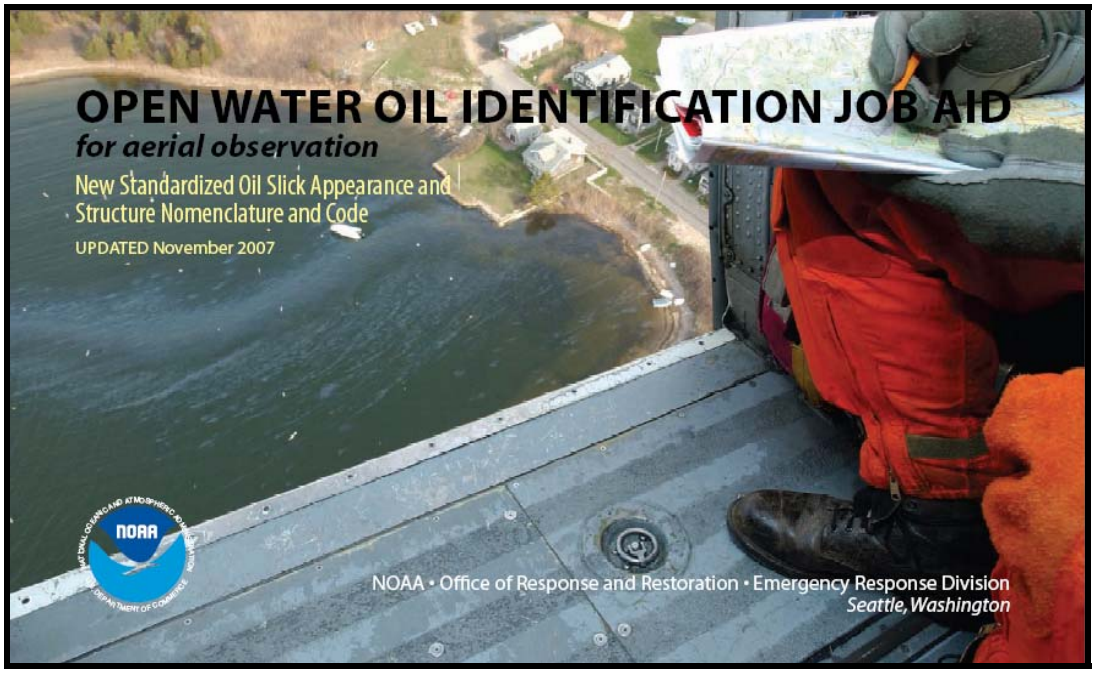
Once spilled, oil begins to spread and move quickly with winds and currents. NOAA conducts modeling to forecast the likely movement of the oil. Knowing where the oil is going to go and when it will arrive is critical for protection of sensitive areas and staging of response equipment.



NOAA guidebook describing the basic concepts involved in analyzing the trajectory of spilled oil.

Where is the oil?

An important step in spill response is to assess the character and extent of oil spilled on the water. During spills, the NOAA scientific support team conducts systematic aerial reconnaissance to track the oil movements. This information is used by the Incident Command to prioritize response and direct cleanup resources. NOAA developed and maintains guidance on oil spill reconnaissance. This job aid helps responders perform efficient assessments and use standard language to communicate their findings effectively. Similar job aids are available for shoreline oiling.



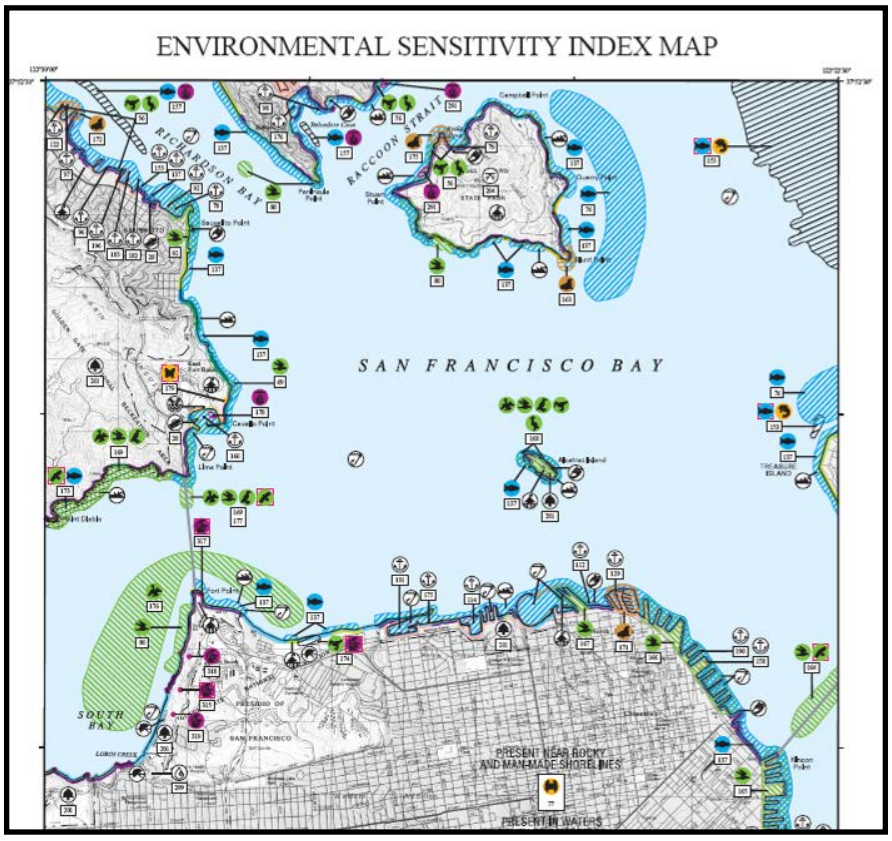
NOAA Aerial Observation Manual

What resources are at risk?

The impacts of a spill will vary depending on the resources at risk. Spills in urban harbors will typically have less severe biological impacts than spills in more pristine locations, but harbor spills may result in substantial commercial and recreational disruptions.

Basic shoreline types are important considerations, as sensitivity to oil spills and cleanup alternatives vary considerably. Exposed rocky shorelines have a lower sensitivity than sheltered marshes because oil is much more likely to persist in the marshes. Cobble and pebble shorelines may collect large amounts of oil because of the interstitial spaces.

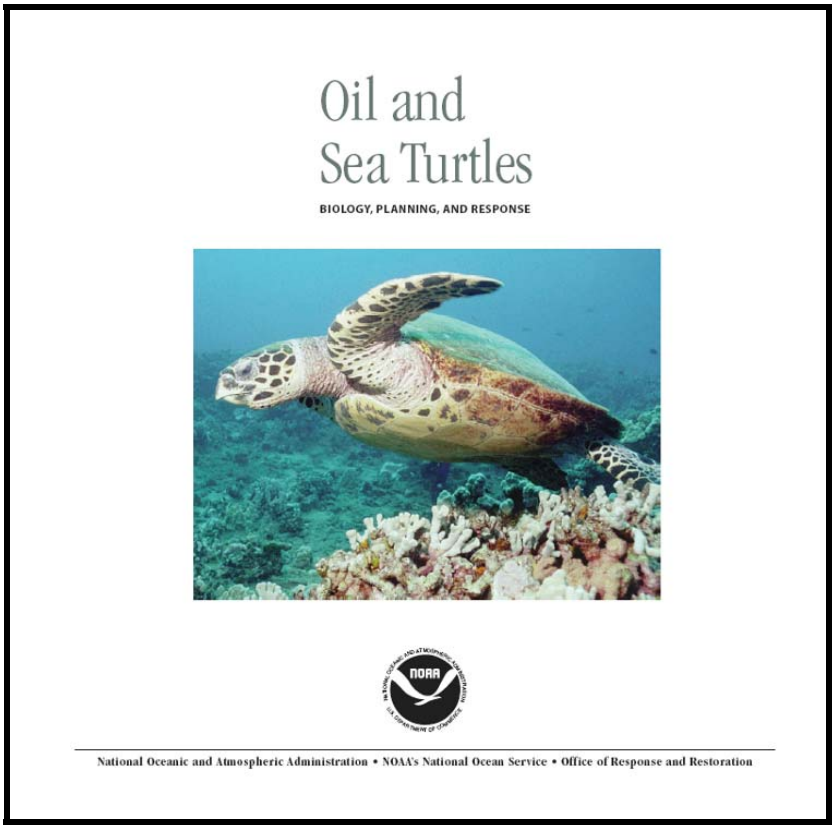
NOAA maintains shoreline sensitivity maps of the entire US coastal zone. These maps include basic shoreline types, data on wildlife, fish, and shellfish resources, and human use resources such as parks, marinas, and water intakes. This information allows responders to rapidly prioritize and protect sensitive areas.



Portion of an ESI map for San Francisco Bay.

What types of biological effects are anticipated?

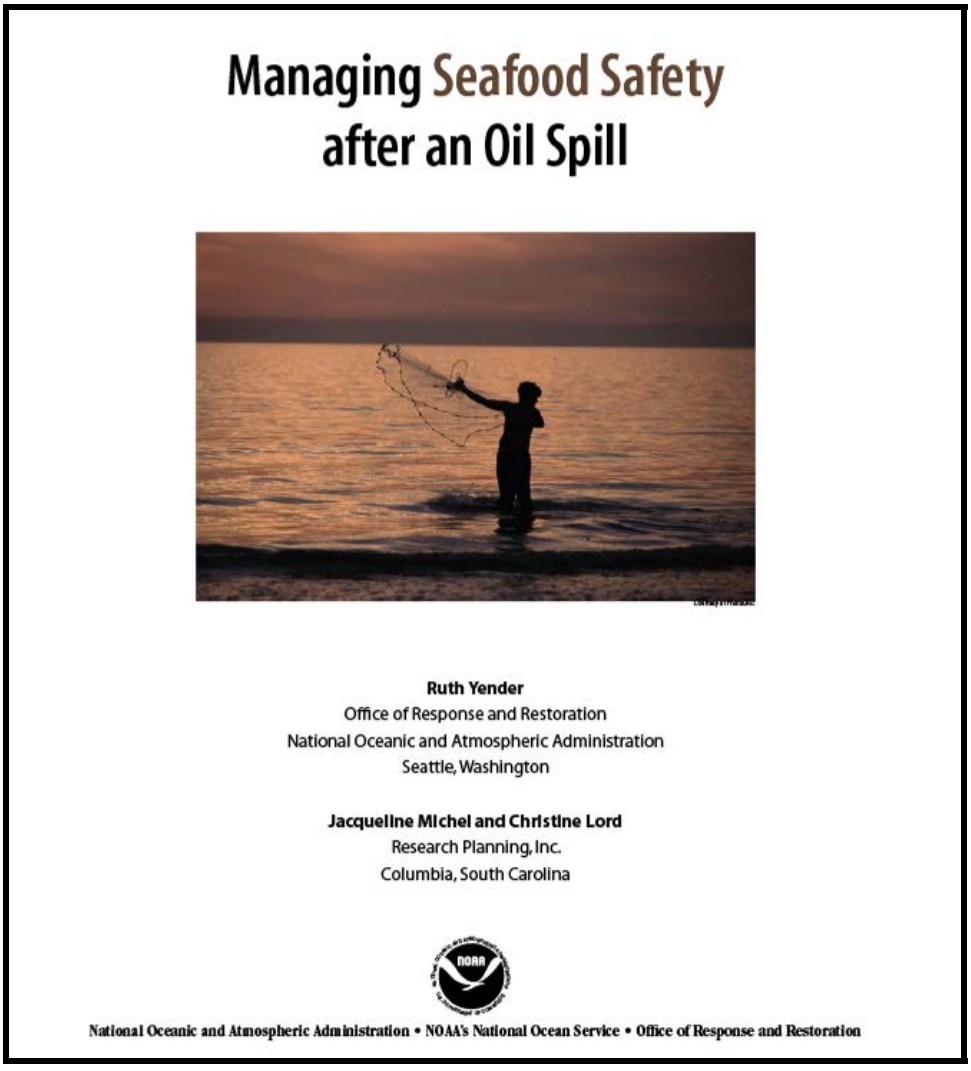
The severity of biological impacts will be very incident specific and depend on many factors including toxicity of the oil, environmental conditions, seasonality and presence of sensitive resources. Even a small spill, in a sensitive environment or time of year can have significant impacts. Time of year can be a major factor in whether migratory fish and wildlife are present, or if sensitive life stages, such as fish spawning, is on-going. Certain response and cleanup alternatives also have the potential to cause additional harm. NOAA helps to address these considerations through research and planning and works within the Incident Command during spills to select response alternatives and cleanup endpoints that minimize biological impacts and maximize recovery of the affected resources.



NOAA Guide on planning and response considerations for sea turtles.

Are there any closures or restrictions?

Ports, waterways, and fishing grounds may be closed or restricted during a pollution response to facilitate cleanup and prevent tainted seafood products from reaching markets. These closures may have significant economic and social implications. Closure of a large port for even a day may have regional or even national implications. Management of fisheries during spills can also be complex. Research on past spills has shown that seafood safety is rarely a problem but communication of risk is complex. The economic impact on fishery dependent communities can be widespread. Spill impacts may be restricted to a small region, but the public may assume that all seafood products from the entire state are contaminated. NOAA works with local and state seafood managers to help manage fisheries during a spill event.



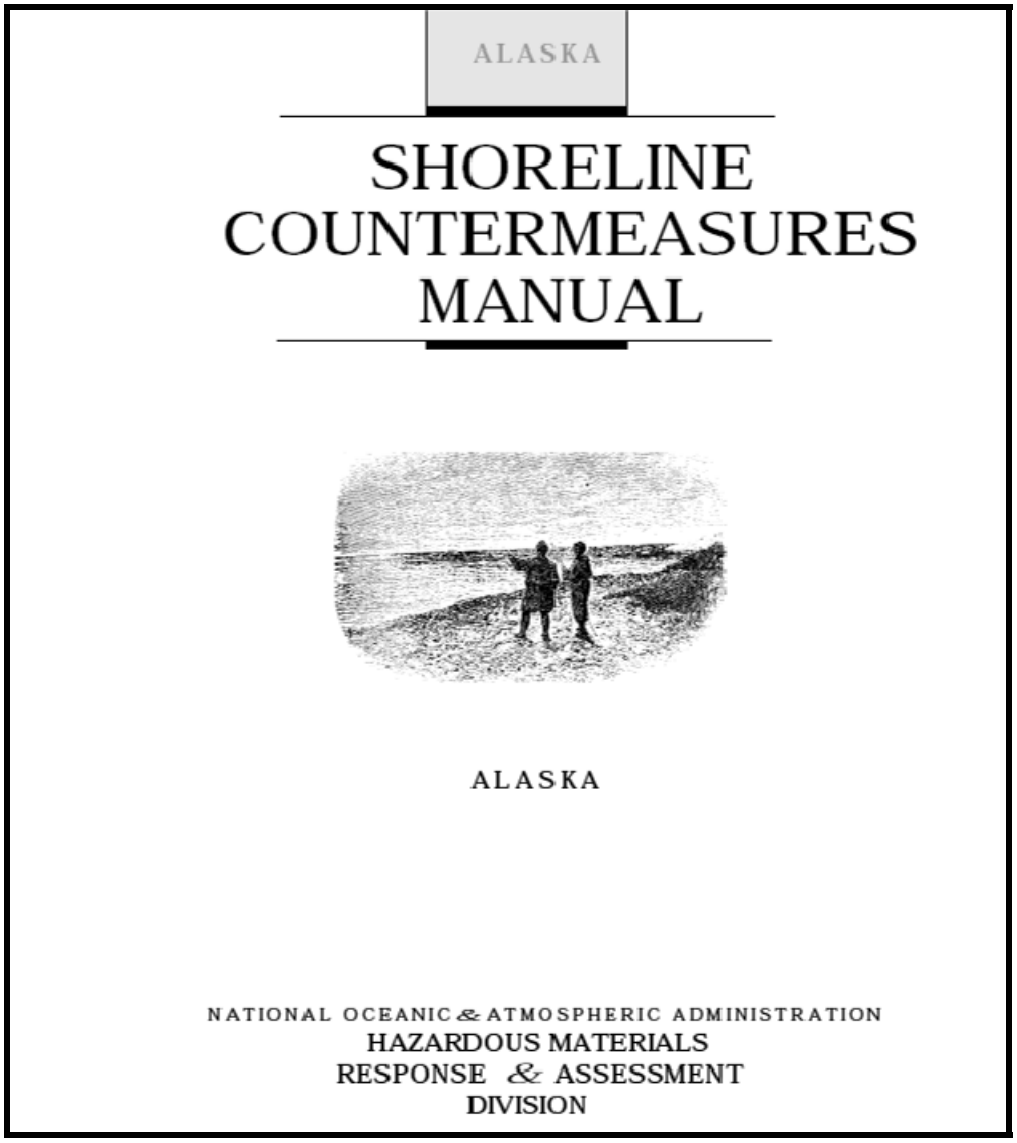
Will the vessel be moved to a place of refuge?

A place of refuge is an area, often a port or sheltered embayment, where a vessel in distress can be taken for repair and stabilization. In the event of a leaking vessel, the decision to bring a ship into a harbor may reduce the overall impact on the environment, but the place of refuge may incur significant localized impacts. NOAA helps the unified command to select places of refuge based on prevailing weather and oceanographic conditions, resources potentially at risk, harbor bathymetry, and other critical information. The actual designation of a Place of Refuge will always be an incident-specific decision made by the U.S. Coast Guard Captain of the Port.

Car Carrier Cougar Ace near Dutch Harbor Alaska.

What types of response countermeasures are being used?

Most spill response efforts rely on long-established countermeasures such as booms and skimmers at sea, and manual labor on shore. On occasion, alternative response technologies such as dispersants and burning may be used. In all instances, selection of response options involves trade-offs among cost, efficacy, and environmental impacts. NOAA helps to evaluate cleanup alternatives during planning and during responses and has prepared a series of shoreline countermeasure manuals for particular regions and shoreline types.



How much oil has been recovered?

Recovery rates for oil spills are highly variable and depend on the oil type, location, and intensity of the response. Light products such as diesel and gasoline spread, evaporate, and disperse quickly, leaving little to recover. Heavier oils often have higher recovery rates, but responders rarely recover more than a fraction of the spilled oil. Occasionally, high recovery rates may be reported, sometimes nearing or even exceeding the amount spilled. These reports are often a result of the inclusion of the oily material, including oily debris and water, rather than just the volume of oil recovered.

Recovery of all of the spilled oil may not necessarily be desirable from an environmental recovery perspective. The harm caused by intrusive cleanup methods may outweigh the benefits of oil removal. NOAA helps the Unified Command to determine "how clean is clean" and when to stop cleanup.

Solitary tar ball on a sand beach.

How long will the cleanup take?

Most spill responses are completed in a matter of days but large spills, especially those in remote locations, may take months or years to complete. The time window for at-sea recovery tends to be short- only a matter of days. Shoreline cleanup is the most labor intensive, and a large crew may be needed for months on a major incident. As the response winds down, the staffing may drop to a small crew responsible for monitoring and cleaning and demobilization of equipment.

Duration of cleanup operations will vary significantly with the climate, oil type and shoreline type. Arctic and subarctic locations are especially challenging as severe weather, safety considerations, and limited winter daylight may restrict cleanup operations. Oil types are an important consideration. Light oils such as gasoline and diesel tend to evaporate and disperse quickly, leaving little to recover. Heavier oils, including bunker fuels, can be quite persistent and require lengthy cleanup operations. The shoreline type is also important in terms of access and penetration of oil. Large sandy shorelines may allow heavy equipment access, and oil is generally readily recovered. Small pocket beaches with gravel and cobble may be very time-consuming to clean because of access limitations and the potential for substantial subsurface penetration of oil.

As response efforts continue during a spill, the recovery of oil tends to decline while collateral impacts of the response increase. Recovery of the last 10% of the oil may take as much effort as the first 90%. More and more aggressive techniques are necessary, potentially increasing environmental harm and delaying recovery. NOAA helps to evaluate the environmental trade-off and determine reasonable cleanup endpoints.

UNIFIED COMMAND DECISION MEMO
M/V SELENDANG AYU INCIDENT

June 23, 2006

Subject: Completion of Response and Stand Down

The Unified Command has determined that response operations initiated as a result of the grounding and breakup of the M/V SELENDANG AYU are complete. Shoreline treatment has reached the lowest practicable level of contamination and remaining contamination does not pose a significant threat to public health or the environment.

Natural Resource Damage Assessment, the processing of claims, and other activities by federal, state, and responsible party organizations will continue. Ongoing communications among the organizations participating in the response and their constituents will also continue as needed.

Accordingly, the Unified Command will stand down effective with the close of business on Friday, 23 June, 2006.

How do claimants get compensated for their losses?

There are a wide variety of claims that may arise after spills, including claims from individuals incurring loss of income, oiled vessels, property damage, or other personal losses. The responsible party must establish a claims procedure following an incident, and advertise the availability of the claims process. If the spiller is unknown, or if the responsible party fails to resolve claims, claimants may then submit their claims to the U.S. Coast Guard's National Pollution Funds Center (NPFC) for adjudication. The NPFC has extensive guidance on claims processes at http://www.uscg.mil/npfc/

How do natural resources get restored?

Under the Oil Pollution Act, NOAA and other designated Federal, State, and tribal trustees are authorized to conduct natural resource damage assessments, bring claims against the spiller or the Oil Spill Liability Trust Fund, and use the recovered funds for restoration of the affected resources. The damage assessment process is generally initiated within days of the incident, but can take several years to complete. The goal of the assessment process is to determine the amounts and types of injuries to natural resources and public lost uses and to develop restoration projects that compensate for those losses. The public has an opportunity to participate in the restoration planning process by proposing restoration concepts and by commenting on draft and final restoration plans.

San Francisco Chronicle

SAN FRANCISCO BAY OIL SPILL

How much for a bird? A day not surfing?

Mill Valley meeting discusses spill's costs for people, wildlife

Peter Fimrite, Chronicle Staff Writer
Wednesday, January 30, 2008

PRINT E-MAIL SHARE COMMENTS (0) FONT | SIZE: TOOLS SPONSOR: verizon wireless

A group of government agents is attempting to determine, among other things, the value of a bird's life and the cost in lost enjoyment to a surfer who missed out on a day at the beach.

The men and women from six government agencies are trying to put a value on how the Cosco Busan oil spill affected people and wildlife, and they held a meeting in Mill Valley on Tuesday night to ask the public for ideas on what restorations might be needed in the wake of the disaster.

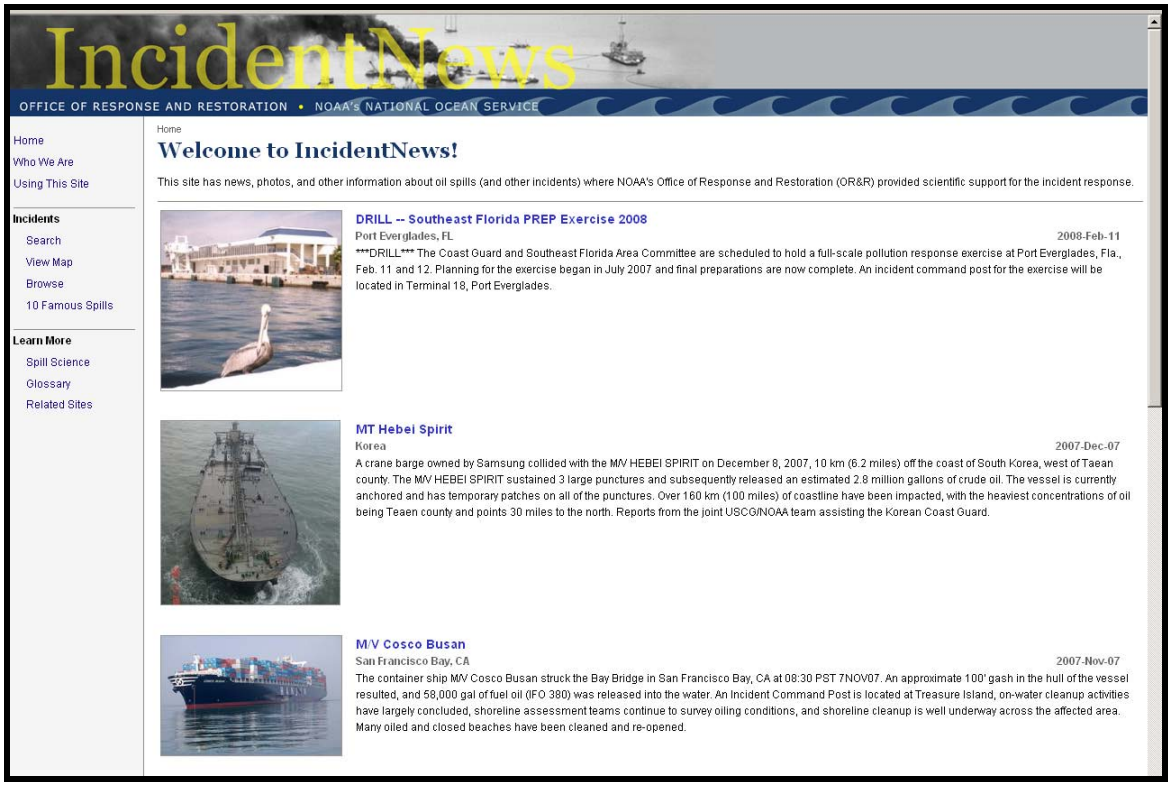
"We can make a claim on behalf of wildlife and habitat and people's use of the resources," said Steve Hampton, a state Department of Fish and Game resource economist.

It was the second meeting in a whole series of studies, reports and hand-wringing sessions that will ultimately result in money being allocated for everything from the restoration of bird habitat to improved beach access. The goal is to compensate for the environmental havoc wrought by the Nov. 7 spill, which dumped more than 53,000 gallons of bunker fuel into the bay.

How do I get more information?

The best source of information during a spill is from the Joint Information Center (JIC). The JIC is part of the Incident Command Structure, and typically includes media representatives from the RP, the Coast Guard, and other local, state, federal and private organizations responding to the spill. All official press releases come through the JIC.

There are a number of other sources of information about of spills. NOAA maintains the Incident News website: http://www.incidentnews.gov/ with information about current and historic spills. The Office of Response and Restoration (OR&R) website http://response.restoration.noaa.gov/ has extensive information on oil and chemical spill response and damage assessments in coastal waters. OR&R also maintains ResponseLINK, a real-time bulletin board for incident specific information, including all maps, trajectories, photographs, and other products generated by NOAA. The NOAA Office of Legislative Affairs has access to this system and can generate briefing products for specific incidents.



What if I want to learn more about spills?

The NOAA Office of Response and Restoration conducts Science of Oil Spills (SOS) workshops to build skills in analyzing complex spill events and making risk-based decisions that maximize long term environmental benefit. The SOS workshops generally take place at NOAA's Sand Point campus in Seattle, but occasionally are held in other regions. The next workshop will be held April 8-10, 2008 in Seattle.
The workshops cover:

- Fate and behavior of oil spilled in the environment.
- An introduction to oil chemistry and toxicity.
- A review of basic spill response options for open water and shorelines.
- Spill case studies.
- Principles of ecological risk assessment.
- A field trip.
- An introduction to damage assessment techniques.
- Determining cleanup endpoints.

Glossary of Oil Spill Terms

NOAA's Office of Response and Restoration (OR&R) – protects coastal and marine resources, mitigates threats, reduces harm, and restores ecological function. The Office provides comprehensive solutions to environmental hazards caused by oil, chemicals, and marine debris.

NOAA Emergency Response Division (ERD) - Provides scientific expertise to support an incident response and helps the OR&R Assessment and Restoration Division (ARD) initiate a natural resource damage assessment.

NOAA Scientific Support Coordinators (SSC) – A special technical advisor within the Incident Command System (ICS), as specified in the National Oil and Hazardous Substances Pollution Contingency Plan. They may be designated as principal advisors for scientific issues, communication with the scientific community and Natural Resource Trustee agencies, and coordination of requests for assistance from state and federal agencies regarding scientific issues.

NOAA Scientific Support Team (SST) - An extensive team of NOAA scientists and technicians as both a home team at ERD headquarters in Seattle and other offices, and the on-scene team. The home team typically includes:
• A weather team working with NWS Incident Meteorologists/forecasters to provide incident specific spot forecasts,
• Oceanographer modelers running the computer models to generate trajectories, spill fate forecasts, and similar products,
• A chemistry team to advise on chemical reactivity, hazards, oil identification, and toxicology,
• Biologists to assist with natural resource protection strategies, and
• An industrial hygienist to provide health and safety and toxicology consultation to the NOAA team and to consult with the Unified Command's Safety officer.

Oil Spill Response Models and Spill Tools –

GNOME (General NOAA Oil Modeling Environment) – NOAA's spill response trajectory model. Used to investigate the effects of different pollutants and environmental conditions on trajectory results. GNOME has the ability to examine both the forecast trajectory ("best guess") and the uncertainty estimate ("minimum regret") at the same time.

Trajectory Analysis Planner (TAP) – an innovative, statistics-based approach to give oil spill contingency planners real-world answers. Graphical output from TAP is presented in five modes; Shoreline Impact Analysis, Response Time Analysis, Site Oiling Analysis, Threat Zone Analysis, and Resource Analysis. TAP is not designed to use during response to an actual spill, but provides an excellent approach to response planning, preparedness, and consequence analysis.

Automated Data Inquiry for Oil Spills (ADIOS2) – an oil spill response tool to assist oil spill responders and contingency planners in making decisions on potential response strategies. ADIOS2 integrates a library of approximately one thousand oils with a short-term oil weathering and cleanup model to help you to develop cleanup strategies based on estimates of the amount of time that spilled oil will remain in the marine environment.

Spill Tools – computer-based tools and learning aids designed to help local groups gain access to information for developing local area plans required under the National Oil and Hazardous Substances Pollution Contingency Plan.

Environmental Sensitivity Index (ESI) Mapping – the most widely used approach to sensitive environment mapping in the United States that systematically compiles information in standard formats for coastal shoreline sensitivity, biological resources, and human-use resources. ESI maps are useful for identifying sensitive resources before a spill occurs so that protection priorities can be established and cleanup strategies designed in advance. Using ESIs in spill response reduces environmental consequences of the spill and cleanup efforts.

Glossary of Standard Oil Spill Observation Terms -

Oil Color and Appearance Terms
Dark (or True) Color: Represents a continuous true oil color (i.e., its natural color), commonly occurring at thicknesses of at least a hundredth of an inch (or, a little over a tenth of a millimeter).

Oil thickness at this "dark" stage (especially in a calm and/or contained state) could range over several orders of magnitude. At sea, however, after reaching an equilibrium condition, most oils would not achieve an average thickness beyond a few millimeters. Heavy fuel oils and highly weathered or emulsified oils (especially on very cold water) could, of course, reach equilibrium states considerably greater than a few millimeters.

Metallic: The next distinct oil color, thicker than rainbow, that tends to reflect the color of the sky, but with some element of oil color, often between a light gray and a dull brown. Metallic is a "mirror to the sky."

Sheen: Sheen is a very thin layer of oil (less than 0.0002 inches or 0.005 mm) floating on the water surface and is the most common form of oil seen in the later stages of a spill. According to their thickness, sheens vary in color from rainbows, for the thicker layers, to silver/gray for thinner layers, to almost transparent for the thinnest layers.

Transitional Dark (or True) color: The next distinct oil on water layer thickness after metallic, that tends to reflect a transitional dark or true oil color. At the "Transitional" stage, most of the oil will be just thick enough to look like its natural color (typically a few thousandths of an inch, or few hundredths of a millimeter), and yet thin enough in places to appear somewhat patchy.

Oil Structure/Distribution Terms

Convergence Zone: A long narrow band of oil (and possibly other materials) often caused by the convergence of two bodies of water with different temperatures and/or salinities. Unlike windrows and streamers, commonly associated with wind, convergence zones are normally associated with the interface between differing water masses, or with the effects of tidal and depth changes that cause currents to converge due to density differences or due to large bathymetric changes. Such zones may be several kilometers in length, and consist of dark or emulsified oil and heavy debris surrounded by sheens.

No Structure: Random eddies or swirls of oil at any one or more thicknesses. This distribution of oil is normally the result of little to no winds and/or currents.

Patches: An oil configuration or "structure" that reflects a broad range of shapes and dimensions. Numerous tarballs could combine to form a patch; oil of various colors and consistency could form a patch or single layer 10s of cm to 10s (or even 100s) of meters in diameter; and a large patch of dark or rainbow oil could have patches of emulsion within it. Patches of oily debris, barely able to float with sediment/plants in them, might be called "tarmats," circular patches at sea might be called "pancakes"; *really big* patches might simply be called "continuous" slicks. But, they are all "patches."

Streamers: Narrow bands or lines of oil (sheens, dark or emulsified) with relatively clean water on each side. Streamers may be caused by wind and/or currents, but should not be confused with multiple parallel bands of oil associated with windrows, or with convergence zones or lines commonly associated with temperature and/or salinity discontinuities.

Tarballs: Discrete, and usually pliable, globules of weathered oil, ranging from mostly oil to highly emulsified with varying amount of debris and/or sediment. Tarballs may vary in size from millimeters to 20-30 centimeters across. Depending on exactly how weathered, or hardened, the outer layer of the tarballs is, sheen may or may not be present.

Windrows: Multiple bands or streaks of oil (sheens, dark, or mousse) that line up nearly parallel with the wind. Such streaks (typically including seaweed, foam, and other organic material) are caused by a series of counter rotating vortices in the surface layers that produce alternating convergent and divergent zones. Sometimes referred to as Langmuir vortices (after a researcher in 1938), the resulting "windrows" begin to form with wind speeds of approximately six knots or more.

Other Oil Slick Terms

Black oil: A black or very dark brown-colored layer of oil. Depending on the quantity spilled, oil tends to spread out quickly over the water surface to a thickness of about one millimeter. However,

from the air it is impossible to tell how thick a black oil layer is. The minimum thicknesses for a continuous black oil layer would commonly be around a hundredth of an inch to about two tenth of a millimeter. Dark (or Black) oils just begin to look their natural color at around a thousandth of an inch (or, a few hundredths of a millimeter). *See* Chart *link at page bottom.*

Dispersion: The breaking up of an oil slick into small droplets that are mixed into the water column as a result of sea surface turbulence. For response purposes, dispersed oil is defined as oil droplets that are too small to refloat back to the surface. The physical properties of the oil and the sea state are the main factors that determine how much oil is dispersed. Chemical dispersants can be used to change the chemical properties of the oil and enhance oil dispersion.

Emulsification: The formation of a water-in-oil mixture. The tendency for emulsification to occur varies with different oils and is much more likely to occur under high energy conditions (winds and waves). This mixture is frequently referred to as **mousse**. Emulsification will impact the cleanup by significantly increasing the volume and viscosity of the oil to be collected.

Entrainment: The loss of oil from containment when it is pulled under a boom by a strong current. Entrainment typically occurs from booms deployed perpendicular to currents greater than 3/4 knot.

Recoverable Oil: Oil that is in a thick enough layer on the water to be recovered by conventional techniques and equipment. Only black or dark brown oil, mousse, and heavy metallic layers are generally considered thick enough to be effectively recovered by skimmers. Thinner films may be recoverable with sorbents and/or concentrated with booms or chemical herders to enhance their recovery.

Slick: Oil spilled on the water that absorbs energy and dampens out the surface waves making the oil appear smoother or "slicker" than the surrounding water. "Slicks" refer to oil layers that are thicker than rainbow and silver sheens. Natural slicks, from plants or animals, also may occur on the water surface and may be mistaken for oil slicks.

Weathering: A combination of physical and environmental processes such as evaporation, dissolution, dispersion, photo-oxidation, and emulsification that act on oil and change its physical properties and composition.

SCAT Terms

SCAT Jargon

ACP: *Area Contingency Plan*: Prepared for the use of all agencies engaged in responding to environmental emergencies in a defined geographic area.

ADIOS 2: *Automated Data Inquiry for Oil Spills*: Model developed by NOAA to estimates the evaporation, natural dispersion, and other weathering processes of oil on water for up to the first five days after it is spilled.

API gravity: An arbitrary scale expressing the gravity or density of liquid petroleum products. API gravity is determined by the equation API at 60°F = 141.5/(oil density -131.5).

Beach berm: A nearly flat back portion of a beach, formed of material deposited by the action of the waves.

Beach face: The sloping section of a beach below the berm that is exposed to the swash of the waves

BMP: *Best Management Practice*: Detailed instructions to field observers and crew chiefs on how they can direct crews to accomplish cleanup objectives with the least injury to the environment.

ESA: *Endangered Species Act*: This federal law requires, for a federal action, including pollution response, that the lead federal agency to consult with FWS and NMFS if the federal action (the response, not the pollution itself) may adversely affect ESA-listed species, or their critical habitat.

ESI: *Environmental Sensitivity Index*: Maps used for oil spill planning and response that includes shoreline type, biological resources, and human-use resources.

ERMA: *Environmental Response Management Application*: A Web-based Geographic Information System tool that provides access to spatial data about a response and lots of other environmental data in real time.

EU: *Environmental Unit*: Works within the Planning Section under ICS and has a key responsibility to ensure that any response to an incident addresses environmental, cultural, and socioeconomic priorities.

FOSC: *Federal On-Scene Coordinator*: The Federal OSC is predesignated by EPA or USCG to coordinate and direct Federal responses.

GNOME: *General NOAA Operational Modeling Environment*: Model developed by NOAA ERD to simulate the movement of a substance on or in the water. The GNOME model is the primary tool used by NOAA to forecast the movement of oil for responders.

IAP: *Incident Action Plan*: documents the goals, operational period objectives, and the response strategy defined by incident command during response planning.

ICS: *Incident Command System*: Organizational structure for emergencies consisting of five major functional areas: Command, Operations, Planning, Logistics, and Finance/Administration.

LHTS: Last high-tide swash line. The line formed by the accumulation of wrack or oil at the highest water level during the most recent high tide.

NCP: *National Oil and Hazardous Substances Pollution Contingency Plan* 40 CFR Parts 9 and 300.

NFT: *No further treatment*: A recommendation by SCAT teams for a segment because it has met cleanup endpoints or further removal efforts are expected to cause more harm than leaving the oil in place.

NHPA Section 106: *National Historic Preservation Act*: Requires Federal agencies to take into account the effects of their undertakings on historic properties through consultation with the SHPO.

NMFS: *National Marine Fisheries Service*. NOAA office under the National Ocean Service.

NOO: *No oil observed*: SCAT term for no visible oil.

NPFC: *National Pollution Funds Center*: USCG office than manages the Oil Spill Liability Trust Fund.

NPS: *National Park Service.* A bureau in the U.S. Department of the Interior. They often take the lead on cultural

resource issues, as well as spills that affect national park properties.

NRT: *National Response Team*: responsible for broad coordination and oversight of preparedness, planning and response across the federal government.

OR&R: *Office of Response and Restoration*: NOAA office under the National Ocean Service.

RAR: *Resources at Risk*: Rapid analysis of the natural resources at risk as a result of the incident, including sensitive habitats and biological resources, but also human-use resources and cultural and historical resources.

READ or NRA: *Natural Resource Advisor*: Assigned to monitor operations to document compliance with the STR.

RP: *Responsible Party*: Representative of the spiller during a response.

RRT: *Regional Response Team*: There are 13, composed of representatives from field offices of the federal agencies that make up the NRT, tribal nations, and representatives of state government. The major responsibilities of RRTs include response, planning, training, and coordination.

Segment: A length of shoreline surveyed by SCAT with data documented on a single SOS form. There can be multiple zones per segment.

SSC: *Scientific Support Coordinator*: Provides liaison with the scientific research and response community to the U.S. Coast Guard for oil and chemical spills as part of the Emergency Response Division, Office of Response and Restoration, NOAA.

SHPO: *State Historic Preservation Officer*: Administers the national historic preservation program at the state level and consults with federal agencies during Section 106 review.

SIR: *Shoreline Inspection Report*: Form completed by SCAT teams during inspection of a segment to determine if it meets cleanup endpoints.

SMART: *Special Monitoring of Applied Response Technologies*: A monitoring program to collect real-time data of effectiveness of in situ burning and dispersant applications.

SOS: *Shoreline Oiling Survey*: Form used to document SCAT field observations for a segment.

SOSC: *State Onscene Commander*: State rep to coordinate and direct State responses.

STR: *Shoreline Treatment Recommendation*: Operational permit to work generated by SCAT that indicates where shoreline cleanup is to be done, approved methods, constraints, and best management practices.

THPO: *Tribal Historic Properties Officer*: Tribes that have assumed SHPO responsibilities on their tribal lands.

UC: *Unified Command*: In charge of managing a response and includes the FOSC, SOSC, and RP Incident Commander.

USCG: *U.S. Coast Guard*: Usually the FOSC for spills in marine, coastal, and navigable waterways.

USFWS: *U.S. Fish and Wildlife Service*: One of the bureaus in the U.S. Department of the Interior.

Zone: a section of shoreline that represents a unique combination of shoreline/habitat type, oiling condition, and elevation on the shoreline. Each zone is designated on the SOS form. Zones can be end-to-end, or overlapping (e.g., zone A for a high-water band of oil along 100 ft of riprap and zone B for a band of oil along 200 ft of the beach in front of the riprap

How To Use This Model

The NRT Joint Information Center (JIC) Model explains what a JIC is and why a JIC is established. It outlines the structure, processes, functional positions and roles and responsibilities of JIC personnel.

The NRT JIC Model is separated into the following sections:

- ***Section I – Background and Overview*** provides background information on the Incident Command System (ICS) and the history of the NRT JIC Model. This section also describes how the NRT JIC Model corresponds with other external affairs/public information documents.
- ***Section II – Establishing a Joint Information Center*** provides general information on the structures and processes of the JIC, including how the JIC is operated and how it fits within the different response structures.
- ***Section III – Joint Information Center Staffing*** provides position descriptions, qualifications, responsibilities and position-specific functions of the Public Information Officer (PIO), Assistant PIO (APIO)/JIC Manager, APIO for Information Gathering, APIO for Information Products, APIO for Media Relations, APIO for Community Relations and other potential personnel.

This document is intended for field use. Portions of this document were developed to stand on their own so that specific position descriptions and their corresponding sections may be removed from the NRT JIC Model and given to personnel filling these positions. To use this model, individuals should refer to the position description for which they have been assigned to gain an understanding of their roles and responsibilities. Likewise, users are encouraged to review other sections to identify how their particular roles will fit within the overall JIC operation. Also included in the document are a series of appendices that are designed to provide additional reference materials and tools that can support a JIC operation. These include:

- ***Appendix A: NRT JIC and Emergency Support Function (ESF) #15 – External Affairs Operations During a Federal Response*** describes recommendations to coordinate efforts between the NRT JIC and ESF #15.
- ***Appendix B: Job Aids*** provides checklists that can assist JIC personnel to perform their responsibilities associated with activating and operating a JIC.
- ***Appendix C: Information Exchange Matrices*** provides information exchange matrices that can assist JIC personnel to perform their responsibilities associated with activating and operating a JIC.
- ***Appendix D: Forms*** provides forms that can assist JIC personnel to perform their responsibilities associated with activating and operating a JIC.
- ***Appendix E: References, Worksheets, and Samples*** provides references, worksheets and samples of products and other materials that can assist JIC personnel to perform their responsibilities associated with activating and operating a JIC.
- ***Appendix F: Acronyms*** identifies acronyms and abbreviations common to response operations.

The NRT JIC Model is available online at www.nrt.org.

NOTE: This document outlines basic principles for establishing and implementing a JIC at the Incident Command Post level; however, the guidelines set by official government policy should always take precedence over the guidelines provided in this document. For example, in the case of a nationally significant incident, the National Response Framework (NRF) and ESF #15, should be followed.

[This Page Intentionally Left Blank]

Section I. Background and Overview

1.1 PURPOSE

The NRT JIC Model documents a plan for conducting public information operations during emergency responses and other situations in which multiple organizations need to collaborate to provide timely, useful and accurate information to the public and other stakeholders. The primary focus of the model is to provide the PIO with a JIC structure that works within the framework of the National Incident Management System (NIMS) ICS. However, because it is functionally based, the model can be used during any situation in which there is a need for centralized communications support involving multiple organizations.

The NRT JIC Model was designed based on requirements identified by the NRT and was developed using a collaborative process through the NRT Response Committee's JIC Model Workgroup. The model is primarily intended for use at the Incident Command Post (ICP) level by PIOs and JIC members working under an Incident Commander (IC)/Unified Command (UC) structure.

1.2 REVISIONS

This edition of the NRT JIC Model is an update to the January 2010 version. To develop the updated NRT JIC Model, the NRT Response Committee chartered a joint-agency workgroup of PIOs with Type 1 all-hazards incident response experience, as well as expertise in establishing, managing and demobilizing JICs.

The workgroup made updates to the model based on PIO best practices, lessons learned from public information operations during all-hazards incident responses of all types and changes to various federal plans and guidance.

The NRT JIC Model Workgroup also reviewed and consulted various federal, state and local guidance documents for conducting public information and JIC operations.

The workgroup took special care to ensure that this document is NIMS ICS compliant and applicable to an all-hazards approach to public information activities during incident response.

1.3 NIMS AND HSPD-5

On February 28, 2003, the President issued Homeland Security Presidential Directive 5 (HSPD-5), Management of Domestic Incidents, which directs the Secretary of the U.S. Department of Homeland Security (DHS) to develop and administer NIMS to provide a consistent, nationwide approach for federal, state and local governments to work effectively and efficiently together to prepare for, respond to and recover from domestic incidents, regardless of cause, size or complexity. All federal agencies are required to adopt NIMS.

On March 1, 2004, the Secretary of DHS issued NIMS. NIMS represents a core set of doctrines, concepts, principles, terminology and organizational processes to enable effective, efficient and collaborative incident management at all levels to provide a comprehensive, all-hazards approach to domestic incident management. A key component of NIMS is ICS.

NIMS ICS is a flexible, adaptable and scalable system driven by the tactical needs of the responders at the scene of an incident. ICS provides a flexible management structure, common terminology, standardized training, pre-designated leadership positions, specific span of control and assigned responsibilities.

1.4 ICS

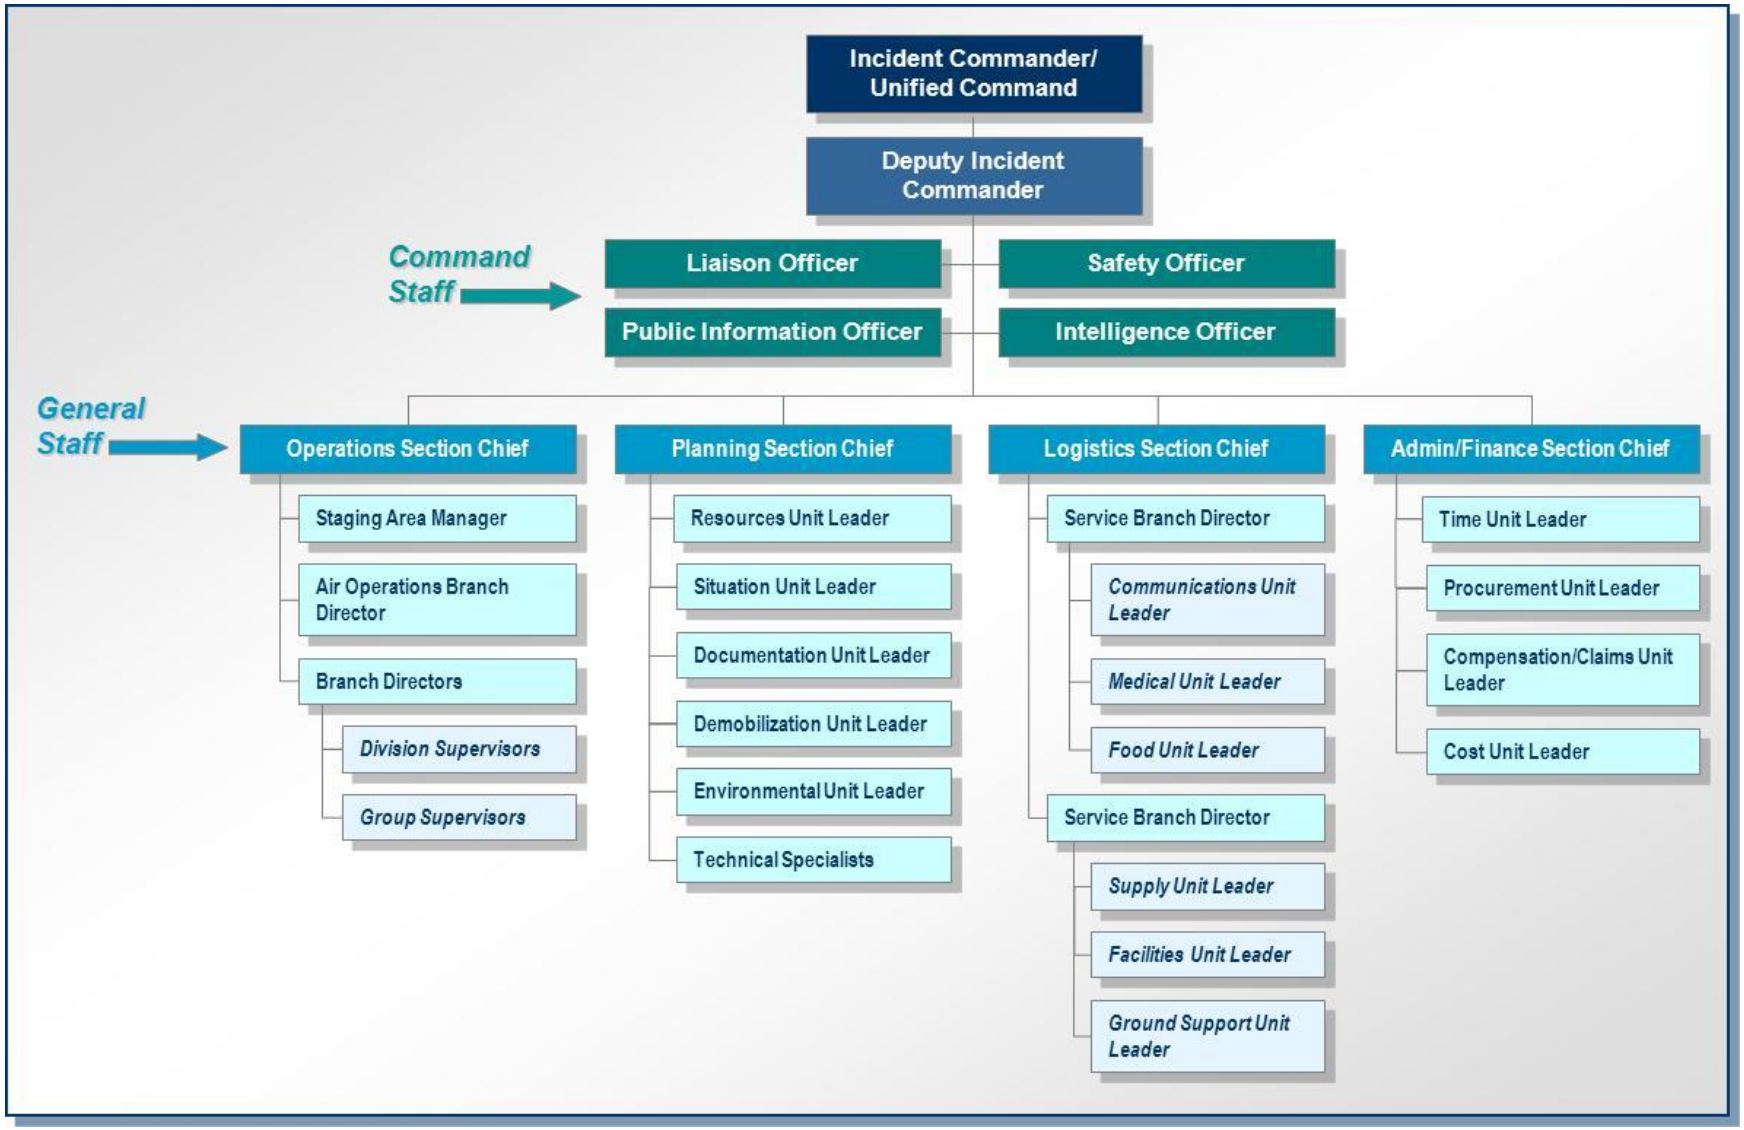
The ICS organization is designed to work equally well for both small and large incidents and can expand or contract to meet the needs of the event. For example, during small incidents, the IC may directly assign tactical resources and oversee all operations. However, large incidents usually require the IC/UC to delegate responsibility for each major activity to separate sections within the organization. Each of the primary ICS functions may be delegated as needed. When more than one entity has response authority, the IC/UC may include response partner representatives from federal, tribal, state, local, private sector and Non-Governmental Organizations (NGO).

The ICS organization is built around five major management functions:

- ***Command*** - sets objectives, priorities and has overall responsibility at the incident or event.
- ***Operations*** - conducts tactical operations to carry out the plan, develops the tactical objectives and organization and directs all resources.
- ***Planning*** - develops the Incident Action Plan (IAP) to accomplish the objectives, collect and evaluate information and maintain resource status.
- ***Logistics*** - provides support to meet incident needs, as well as resources and all other services needed to support the incident.
- ***Finance/Administration*** - monitors costs related to the incident and provides accounting, procurement, time recording and cost analysis.

On the following page, Figure 1 is an illustration of the ICS organization.

FIGURE 1 – ICS ORGANIZATION



Under ICS, the PIO is one of the key members of the Command Staff. The PIO represents and advises the IC/UC on all public information matters relating to the incident. In carrying out public information responsibilities, the PIO and JIC staff may interact with personnel at all levels of the ICS organization, including the IC/UC and other Command and General Staff positions.

1.5 FLEXIBILITY OF THE NRT JIC MODEL

The NRT JIC Model is flexible, scalable and can be adapted for use in a diverse range of field responses likely to be performed by NRT member agencies, ranging from a small, single agency, single-hazard response that lasts a few hours to a large, multiple agency, multi-hazards response or recovery operation that lasts for several weeks or months.

Although NRT member agencies respond to oil spills and other hazardous materials releases under the National Oil and Hazardous Substances Pollution Contingency Plan (NCP) and ESF #10 – Oil and Hazardous Materials Response, the NRT JIC Model has been designed to be an all-hazards model that is compatible with NIMS.

The NRT JIC Model is a voluntary guidance document, not a regulation or requirement. Individual NRT agencies and other response partner organizations may modify the NRT JIC Model or develop their own JIC model to better meet their specific needs, hazards, incident type, JIC type and available personnel and other resources.

For example, the Federal Emergency Management Agency (FEMA) is an NRT member agency that has developed several guidance documents and training courses for PIOs that provide samples of several different JIC organizational structures:

- ***NIMS IS-702 (Public Information Systems) training*** - http://training.fema.gov/emiweb/is/is702.asp
- ***FEMA publication 517: "Basic Guidance for Public Information Officers"*** - http://www.fema.gov/emergency/nims
- ***NIMS IS-250 (Emergency Support Function #15) training*** - http://training.fema.gov/emiweb/is/is250.asp

The JIC organizational structures described in this NRT JIC Model, NIMS IS-702 and FEMA Publication 517 are designed for use under ICS at the Incident Command Post level. The JIC organizational structure described in NIMS IS-250 is designed for use at an Area, Support or National JIC formed under the NRF. Additional information concerning NRT JIC and ESF #15 operations during a Federal response can be found in Appendix A.

Although the job titles and responsibilities may vary between the various JIC organizational structures, they are designed to perform the same mission: to keep the public informed during a crisis/event. The following table compares and contrasts the roles and responsibilities defined in the various JIC organizational structures identified on page 4.

NRT JIC Model	NIMS IS-702 Course	FEMA Publication 517 Guidance	NIMS IS-250 ESF #15 Training
Incident Commander/ Unified Command	Incident Commander/ Unified Command	Incident Commander/ Unified Command	Principal Federal Official or Federal Coordinating Officer
Public Information Officer	Public Information Officer	Lead Public Information Officer	ESF #15 External Affairs Officer or Deputy Officer
Assistant Public Information Officer/JIC Manager	Deputy Public Information Officer or JIC Coordinator	JIC Facility Liaison	ESF #15 Executive Officer and/or Resource Manager
Assistant Public Information Officer for Information Gathering	Information Gathering and Analysis	Information Gathering	Strategy/Message Unit Leader
Assistant Public Information Officer for Information Products	Information Coordination and Production	Information Dissemination	Assistant External Affairs Officer for Planning & Products
Assistant Public Information Officer for Media Relations	Information Dissemination	Divided among Information Gathering and Information Dissemination	Assistant External Affairs Officer for the JIC or Media Relations Unit Leader
Assistant Public Information Officer for Community Relations	Public Inquiry Center	Liaison for Community Relations	Assistant External Affairs Officer for Community Relations

[This Page Intentionally Left Blank]

Section II. Establishing a Joint Information Center

2.1 WHAT IT IS

The Joint Information System (JIS) provides the mechanism to organize, integrate and coordinate information to ensure timely, accurate, accessible and consistent messaging across multiple jurisdictions and/or disciplines.

The JIC is the central location that facilitates the operation of the JIS. It is a physical or an Internet-based virtual location where personnel with public information responsibilities perform media and community relations during an incident or event. The JIC structure is designed to work equally well for large or small incidents and can expand or contract to meet the needs of the incident.

Efficient information flow is critical to effectively meet public information needs and carry out PIO responsibilities when multiple organizations come together to respond to an emergency or manage an event.

By maintaining a centralized communication facility, resources can be better managed and duplication of effort is minimized. The use of a JIC allows for tracking and maintaining records and information.

2.2 JIC RESPONSIBILITIES

- Be the first and best source of information.
- Develop, recommend and execute public information plans and strategies on behalf of the IC/UC.
- Advise the IC/UC concerning public affairs issues that could impact the response.
- Ensure the various response agencies' information personnel work together to minimize conflict.
- Gain and maintain public trust and confidence.
- Gather information about the crisis.
- Capture video and photos of the crisis for release to the media and to support the response.
- Write and communicate emergency public information regarding public protective actions, evacuations, sheltering and other public safety messages.
- Ensure the timely and coordinated release of accurate information to the public by providing a single release point of information.
- Facilitate and manage control of rumors.
- Monitor and measure public perception of the incident.
- Inform the IC/UC of public reaction, attitude and needs.

2.3 WHEN IT SHOULD BE ESTABLISHED

The JIC structure is most useful when multiple organizations must coordinate timely, accurate information to the public and other stakeholders. Emergency situations could include natural disasters, oil spills and other hazardous substance releases or terrorist incidents. The JIC structure may also be useful in coordinating multi-agency event planning for major meetings and events, such as the Olympics, Super Bowl.

The following are incident types in which multiple agencies are involved and for which the IC/UC would usually decide to establish a JIC.[1]

Type 4

- Command staff and general staff functions are activated only if needed.
- Several resources are required to mitigate the incident.
- The incident is usually limited to one operational period in the control phase.
- No written IAP is required, but a documented operational briefing will be completed for all incoming resources.
- Examples include house fires, minor oil spills and minor chemical releases.

Type 3

- When capabilities exceed initial needs, the appropriate ICS positions should be added to match the complexity of the incident.
- Some or all of the Command and General Staff positions may be activated, as well as Division/Group Supervisor and/or Unit Leader level positions.
- The incident may extend into multiple operational periods.
- A written IAP may be required for each operational period.
- Examples include the Texas City Refinery explosion and fire, Graniteville, SC train derailment, medium oil spill or chemical release and local flooding.

Type 2

- This type of incident extends beyond the capabilities of local control and is expected to go into multiple operational periods. A Type 2 incident may require the response of resources out of the area, including regional and/or national resources, to effectively manage the operations, command and general staffing.
- Most or all of the Command and General Staff positions are filled.
- A written IAP is required for each operational period.
- Many of the functional units are needed and staffed.
- Examples include National Special Security Events (NSSE), such as pre-deployments for the Olympics or Super Bowl, national political conventions, major flooding and major wildfires.

[1] Source: U.S. Fire Administration. http://training.fema.gov/EMIWeb/IS/ICSResource/assets/IncidentTypes.pdf

Type 1

- This type of incident is the most complex, requiring national resources to safely and effectively manage and operate.
- All Command and General Staff positions are activated.
- Branches need to be established.
- Use of resource advisors at the incident base is recommended.
- There is a high impact on the local jurisdiction requiring additional staff for office administrative and support functions.
- Examples include the Deepwater Horizon Event, the terrorist attacks of September 11, 2001, Hurricane Katrina, and national pandemic influenza.

2.4 FLEXIBLE, FUNCTIONAL APPROACH

The JIC structure is designed to accommodate the diverse range of responses likely to be performed by NRT member agencies, ranging from a large multiple-agency, all-hazards response to a small single-agency, single-hazard response. The structure can grow or shrink depending on the unique requirements of a specific response and should be customized for each response. This adaptability encompasses staffing, organizational structure, facilities, hours of operation, resource and logistical requirements, and products and services. If a virtual JIC is established, JIC staff members can perform their assigned functions from work, home or any location with Internet access.

The JIC organizational structure is based on functions that must be performed whether a person is handling a routine emergency, or managing communications for a major response to a disaster. The following are options for organizing a JIC.

FIGURE 2 – INITIAL PIO

The organizational chart below represents the jobs being accomplished by the initial PIO and assistants, if any, before the JIC is formed.

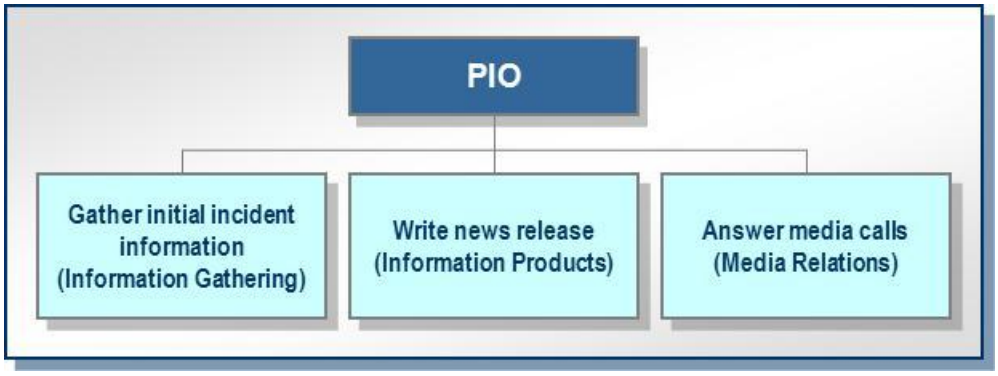


FIGURE 3 – JIC (TYPE 4)

The organizational chart below is an example of how the initial JIC structure may look during a Type 4 incident. A box represents a person assigned to the JIC. The functions performed by personnel in these positions are listed below each box.

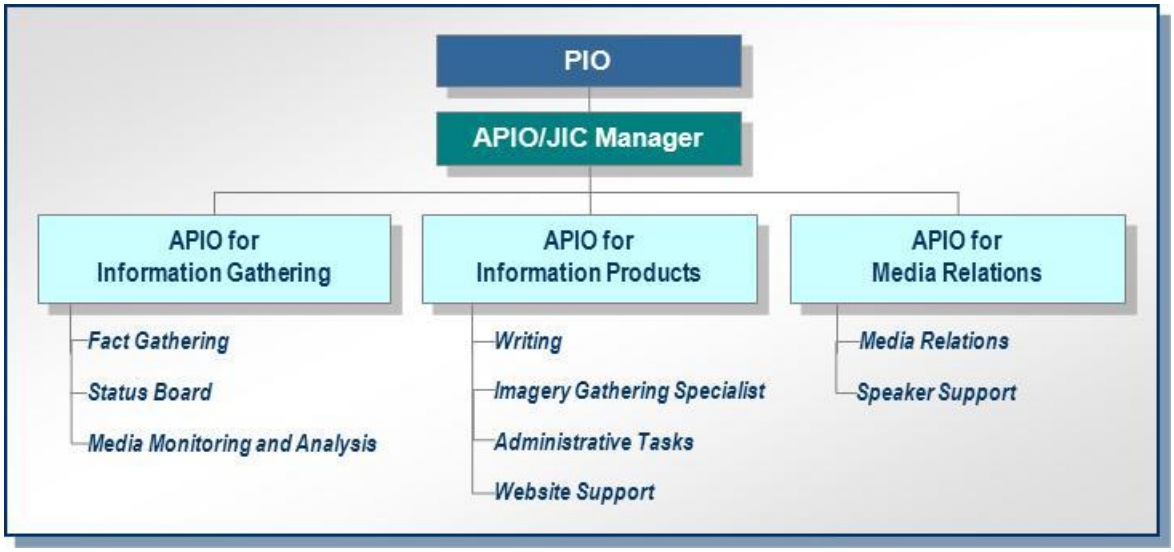

FIGURE 4 – JIC (TYPE 3)

The organizational chart below is an example of how the JIC structure may look during a Type 3 incident. Response positions below the APIO level may be staffed by more than one person, based on the needs of the incident. Functions not specifically assigned would be performed by the appropriate APIO.

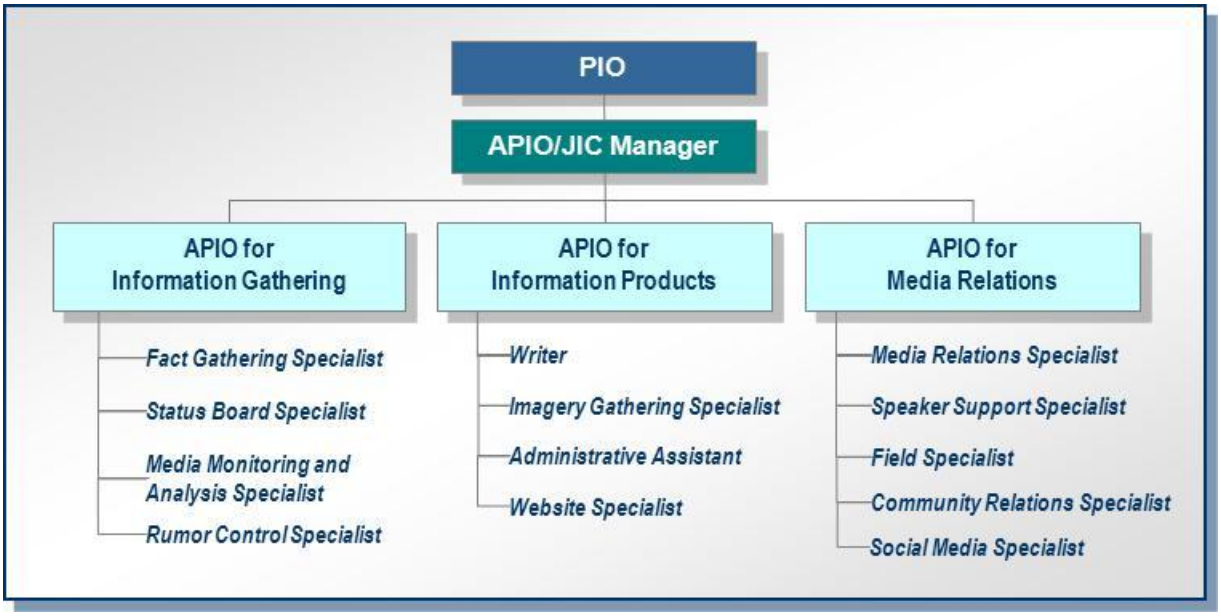

FIGURE 5 – JIC (TYPE 3 OR TYPE 2)

The organizational chart below is an example of how the JIC structure may look during a Type 3 or Type 2 incident with major community relations issues. Response positions below the APIO level may be staffed by more than one person, based on the needs of the incident. Functions not specifically assigned would be performed by the appropriate APIO.

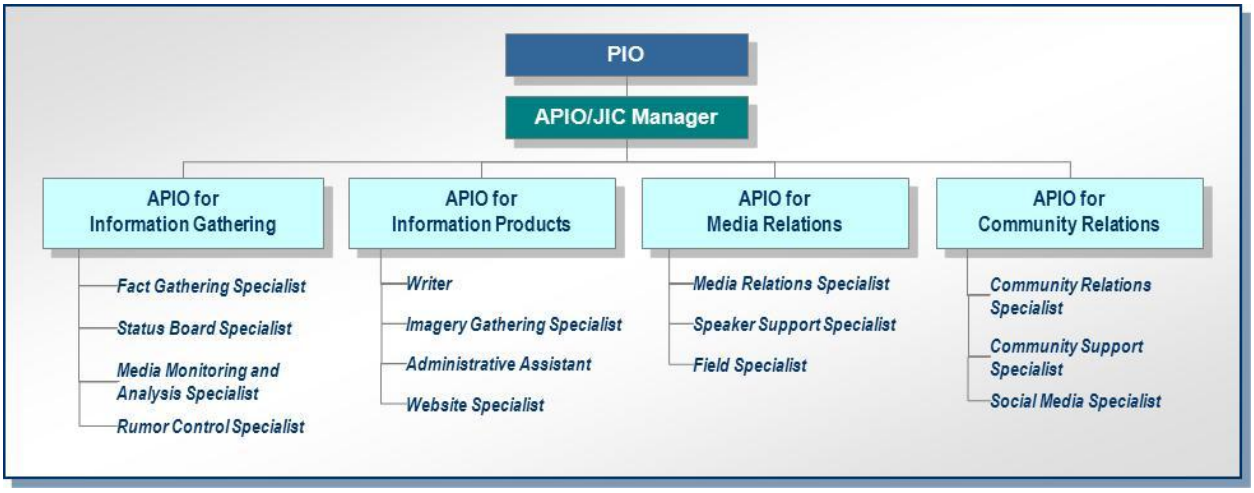

FIGURE 6 – JIC (TYPE 3, TYPE 2, OR TYPE 1)

The organizational chart below is an example of how your JIC structure may look during a Type 3, Type 2 or Type 1 incident with major community relations issues and a need for constant JIC representation in the field. Response positions below the APIO level may be staffed by more than one person, based on the needs of the incident. Functions not specifically assigned would be performed by the appropriate APIO.

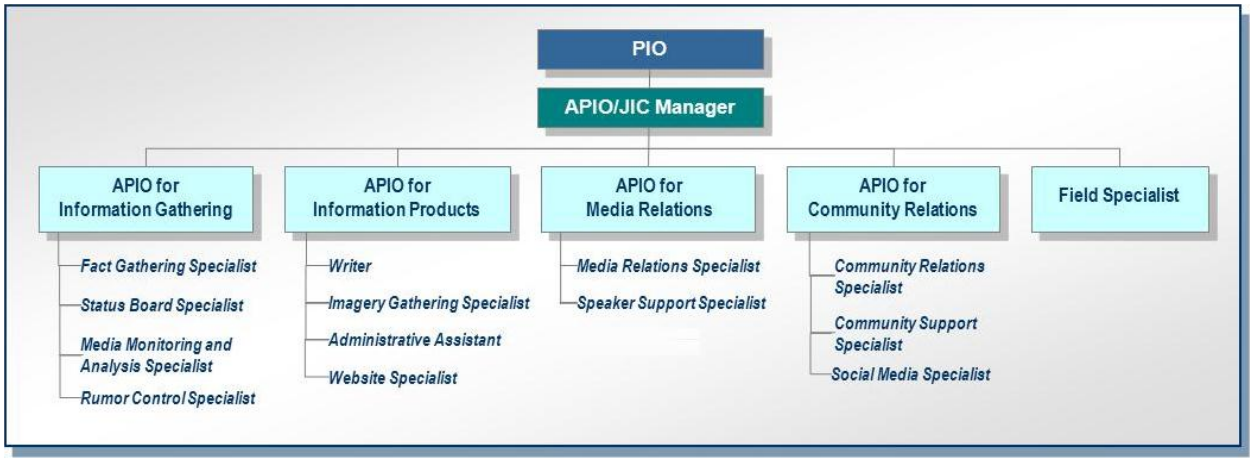

FIGURE 7 – JIC

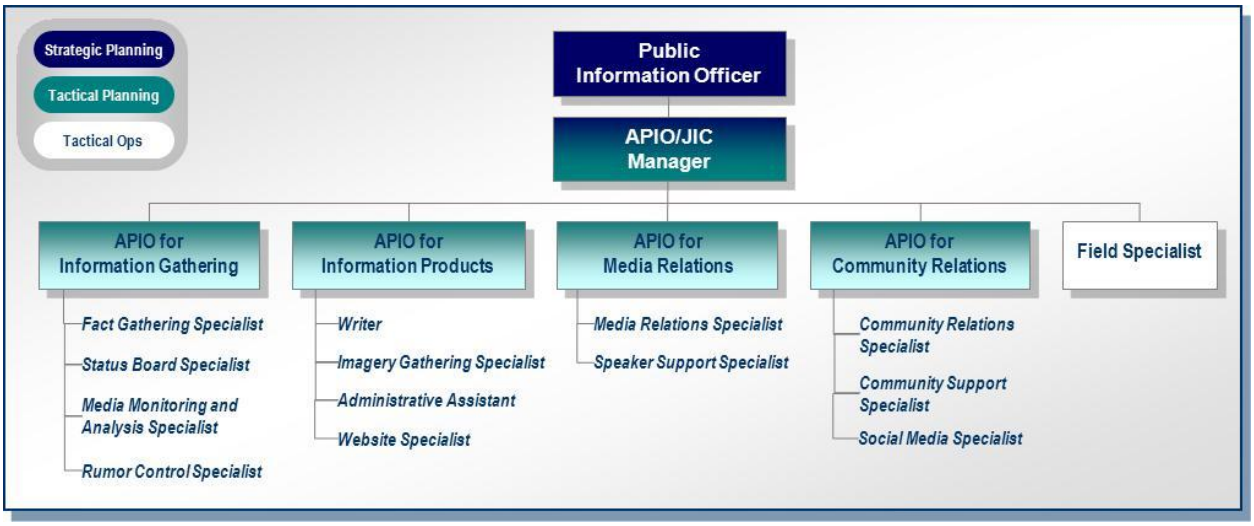
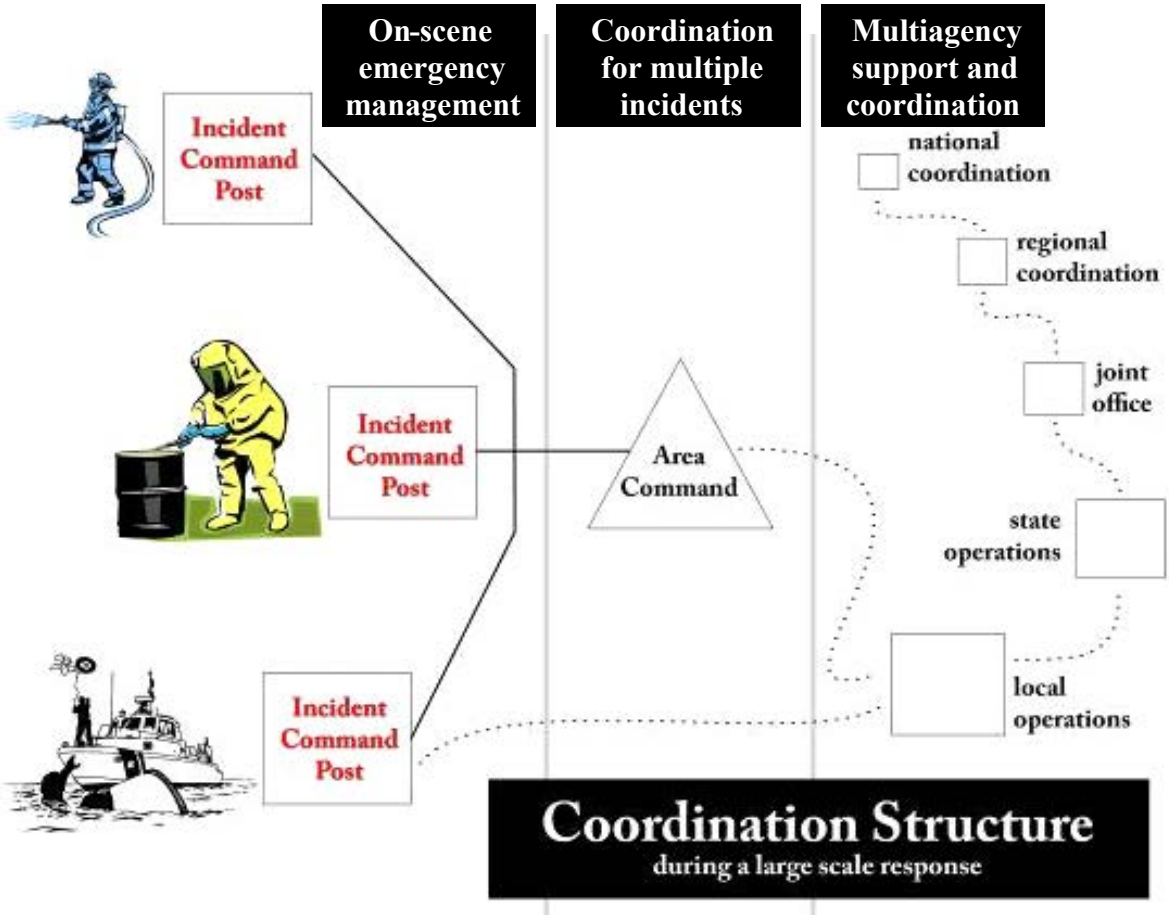
The organizational chart below illustrates how JIC management and leadership activities divide among the three leadership levels of PIO, APIO/JIC Manager and APIOs below the JIC Manager for, or with, APIO for Information Gathering, APIO for Information Products, APIO for Media Relations and APIO for Community Relations. The PIO has certain responsibilities dictated by NIMS ICS and in reality spends most of his or her time outside the JIC working on strategic goals with the IC/UC and other Command and General staff. The JIC Manager works with the PIO on strategic plans, takes on the PIO's responsibilities in his or her absence and acts as an office manager, primarily directing the APIOs. The APIOs are the top-level "specialists", and work with the JIC Manager to develop tactical public information activities in support of the IC/UC's strategic plans. Activities below the APIO level are more specialized (in a full JIC) comprising "boots on the ground" work implementing tactical operations.



2.5 COORDINATION

FIGURE 8 – COORDINATION STRUCTURE DURING A LARGE SCALE RESPONSE

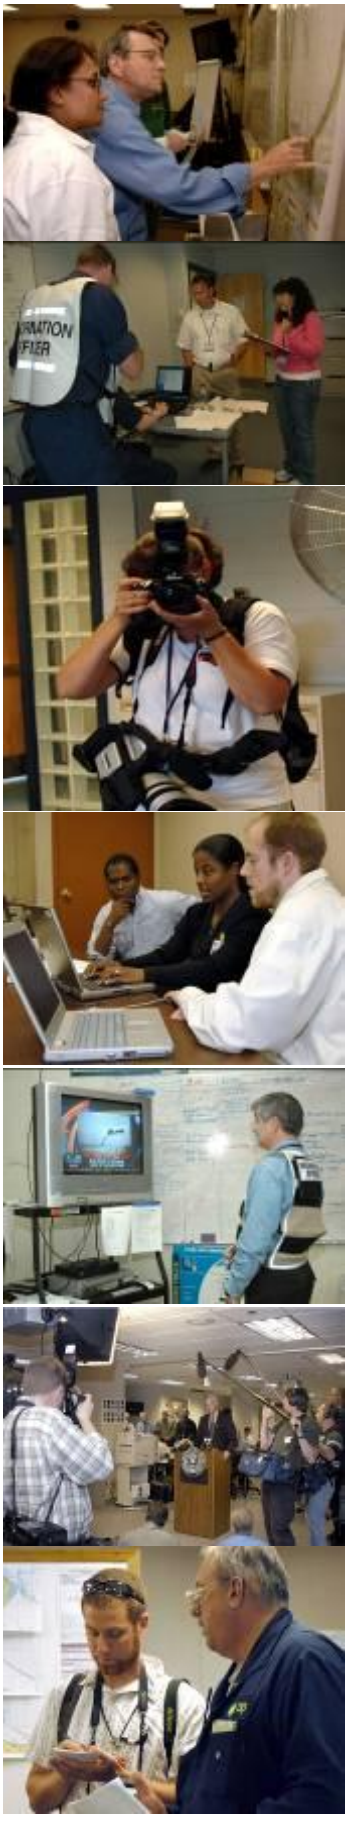


During a national incident of significance, a coordinated response from all levels of the national response community occurs. The figure above illustrates the command and coordination structure that could be put in place during such an incident. ICP PIOs and JICs are located where tactical operations are managed directly. Multiple ICPs may be established due to geographic concerns, such as during widespread wildland fires, or for specific mission assignments, such as one ICP solely responsible for oil spill response or other missions. At the national level, ESF #15 of the NRF is activated when the Department of Homeland Security determines an incident is complex enough to require a coordinated interagency communication effort and is intended to support existing response communication efforts. Coordination between the NRT JIC and ESF #15 is described in more detail in *Appendix A: NRT JIC and ESF #15 operations during a Federal response*.

2.6 ESTABLISHING THE INITIAL RESPONSE

Immediately after an incident occurs, there is a high demand for information. The media, public and responders require accurate and timely information for all incidents—large or small, a natural disaster or accident. The PIO is responsible for the dissemination of updated information during a response/incident.

To assist the PIO in gathering, preparing and disseminating the information a JIC should be established. A guide for the establishment of the JIC, *Job Aid 1 – Establishing the Initial Response* can be found in Appendix B.



Section III. Joint Information Center Staffing

3.1 PIO

Position Description

The PIO is responsible for developing and releasing public information about the incident to the media, incident personnel and other appropriate agencies and organizations.

Only one PIO will be assigned for each incident, including multi-jurisdictional incidents operating under an IC/UC. The PIO may appoint as many assistants (APIO or JIC Specialists) as necessary, and the assistants may also represent assisting agencies, jurisdictions or other response partners (such as private sector and NGOs).

The PIO is appointed by the IC/UC to support the information needs of the response; establish, maintain and deactivate the JIC; and represent and advise the IC on all public information matters relating to the incident. A person is assigned to this position based on skills and ability, not rank or employer.

Position Qualifications

Per NIMS, all Command Staff, including the PIO, should complete the following training:

- IS-100 (ICS 100) Introduction to Incident Command System.
- IS-200 (ICS 200) Introduction for Single Resources and Initial Action Incidents.
- IS-700 National Incident Management System.
- IS-800.B National Response Framework, An Introduction.
- ICS-300 Intermediate Incident Command System for Expanding Incidents.
- ICS-400 Advanced Incident Command System, Command and General Staff-Complex Incidents.

The PIO is also recommended to be trained in:

- IS-250 Emergency Support Function #15.
- IS-702 National Incident Management System Public Information Systems.
- ICS-203 Introduction to Public Information.
- ICS-403 Incident Management Team Public Information Officer.
- ICS-420 Command and General Staff.
- E-388 Advanced Public Information Officer.
- G-290 Basic Public Information Officer.
- Risk Communications.

Responsibilities

- Support public information needs of the IC/UC. (See *Daily Checklist*, Appendix E)
- Obtain approval from Command to disseminate public information products.
- As appropriate, coordinate activities with ESF #15. (See *NRT JIC and ESF #15 operations during a Federal response*, Appendix A. See Job Aid 4, Appendix B)
- Advise Command on public information issues and concerns.
- Attend all Command Staff briefings and meetings. (See *Operational Planning "P"*, Appendix E)
- Share information gathered at Command Staff briefings and meetings with JIC Staff.
- Work closely with the Liaison Officer (LNO), Safety Officer (SO) and Intelligence Officer (INTO).
- Establish and equip a JIC and oversee its operations.
- Gather incident information.
- Inform the media and public.
- Provide public information to incident staff.
- Monitor the media, correct misinformation and identify trends and issues.
- Analyze public perceptions and develop public information strategies.
- Advise response leaders on public perception of the IC/UC and develop strategies to communicate on how the incident is being managed.

Position Specific Functions

Establishing a JIC

When the appointed PIO arrives to relieve the initial PIO, several actions must be taken to establish and manage a JIC. To assist in establishing and managing a JIC, *Job Aid 2 – Establishing a JIC* can be found in Appendix B.

Establishing a 24-hour Schedule

If demands are high, a 24-hour operating schedule may require multiple shifts, such as:

- A Shift: 6am to 3pm.
- B Shift: 2pm to 11pm.
- C Shift: 10pm to 7am.

The one-hour overlap in each 9-hour shift provides time for briefing and transition, and meets most major media deadlines. The C shift may only be required if the incident draws national or international media coverage from multiple time zones.

The decision to establish a C shift is made by the PIO and the IC/UC; however the PIO and/or JIC Manager should consider organizing JIC shifts to mirror those of the rest of the staff at the ICP. In the event a 24-hour schedule is required, an APIO will be assigned to perform the PIO's responsibilities when he or she is not present. The APIO has all of the responsibility and authority of the PIO.

Exchanging Information

Information Exchange Matrix 1 – Public Information Officers can be found in Appendix C. This information exchange matrix describes what types of information or resources the PIO should obtain from

specific response positions within the ICS organization and, if activated, ESF #15, as well as what information or resources the PIO should provide to those same positions.

Working with the Safety Officer, Liaison Officer and Intelligence Officer

The PIO meets regularly with the SO, LNO and INTO. The SO's main responsibility is to monitor safety conditions and develop measures for assuring the safety of all incident personnel. The PIO works with the SO to develop safety messages and escort media and VIPs to the incident site in a safe manner.

The PIO works with the LNO to obtain and provide information to agency representatives, public officials and other stakeholders. The PIO also works with the LNO to address stakeholder concerns, requests for briefings, tours and VIP visits.

The IC/UC may appoint an INTO as the incident requires. The INTO's main responsibility is to supervise, coordinate and participate in the collection, analysis, processing and dissemination of intelligence. The PIO works with the INTO regarding intelligence information and operational security. *Figure 1 – ICS Organization* (page 3) shows the INTO as part of the Command Staff. Depending on circumstances surrounding each incident the INTO may become a function within the General Staff as a technical specialist within the Operations Section or Planning Section, or as its own Section[2].

Demobilizing a JIC

The IC/UC determines when to deactivate the JIC based on the recommendation of the PIO. This decision would usually be made when media and public interest has diminished or when recovery and mitigation operations are complete. To assist the PIO with demobilization activities, *Job Aid 3 – Demobilizing a JIC* can be found in Appendix B.

[2] 2008 FEMA Intelligence/Investigations Function Guidance Document

[This Page Intentionally Left Blank]

3.2 APIO/JIC MANAGER

Position Description

The APIO/JIC Manager is selected by the PIO to supervise the daily operations of the JIC; execute plans and policies, as directed by the PIO; and provide direction to the APIOs to ensure that all functions are well organized and operating efficiently. The APIO/JIC Manager should possess public affairs, crisis response, JIC and management or leadership experience. Personnel are assigned to this position based on training, experience, skills and ability, not rank or employer. The APIO/JIC Manager should have the same training as the PIO.

Position Qualifications

In addition to agency training requirements, the APIO/JIC Manager should complete:

- IS-100 (ICS 100) Introduction to Incident Command System.
- IS-200 (ICS 200) Introduction for Single Resources and Initial Action Incidents.
- IS-700 National Incident Management System.
- IS-800.B National Response Framework, An Introduction.
- ICS-300 Intermediate Incident Command System for Expanding Incidents.
- ICS-400 Advanced Incident Command System, Command and General Staff-Complex Incidents.

The APIO/JIC Manager is also recommended to be trained in:

- IS-250 Emergency Support Function #15.
- IS-702 National Incident Management System Public Information Systems.
- ICS-203 Introduction to Public Information.
- ICS-403 Incident Management Team Public Information Officer.
- ICS-420 Command and General Staff.
- E-388 Advanced Public Information Officer.
- G-290 Basic Public Information Officer.
- Risk Communications.

Responsibilities

- Assume all responsibilities of the PIO, as needed. (See *Information Exchange Matrix 1*, Appendix C)
- Be familiar with all forms in Appendix D: *Forms* and Appendix E: *References, Worksheets, and Samples* and oversee all JIC administrative activities.
- Oversee all operations of the JIC. (See *Job Aids 2, 3, and 4,* Appendix B)
- Ensure proper organization of JIC. (See *Daily Checklist,* Appendix E)
- Coordinate internal JIC information flow. (See *Job Aids,* Appendix B and *Information Exchanges Matrices,* Appendix C)
- Set JIC staff work hours, daily operating schedule and conduct morning and evening briefings. (See *Job Aid 4*, Appendix B)
- Maintain unit log. (See *ICS Form 214,* Appendix D)
- Assess and assign JIC staff to appropriate roles. (See *JIC Staff Self-Assessment Survey,* Appendix E)
- Provide training or coaching to JIC staff as needed.

- Coordinate with Logistics Section Chief (LSC) to obtain equipment, supplies and other resources for the JIC. (See *ICS Form 213 RR-CG*, Appendix D)

Position Specific Functions

Developing the Operating Schedule

The APIO/JIC Manager manages the JIC staff by developing an operating schedule. To assist the APIO/JIC Manager in developing an operating schedule, *Job Aid 4 –Developing the Operating Schedule* can be found in Appendix B. The *Daily Brief Worksheet*, Appendix E is a useful tool when developing the operating schedule as well as *ICS Form 204,* Appendix D.

3.3 APIO FOR INFORMATION GATHERING

Position Description

The APIO for Information Gathering is assigned by the PIO or APIO/JIC Manager.

The APIO for Information Gathering conducts information gathering activities in support of the JIC. Personnel selected for this position should possess experience in public affairs, crisis response, JIC operations and management. Personnel should be assigned to this position based on training, experience, skills and ability, not on rank or employer.

Position Qualifications

In addition to agency training requirements, the APIO for Information Gathering is required to complete:

- IS-100 (ICS 100) Introduction to Incident Command System.
- IS-200 (ICS 200) Introduction for Single Resources and Initial Action Incidents.
- IS-700 National Incident Management System, An Introduction.
- IS-800.B National Response Framework, An Introduction.

The APIO for Information Gathering is also recommended to be trained in:

- IS-702 National Incident Management Systems Public Information Systems.
- ICS-300 Intermediate Incident Command System for Expanding Incidents.
- Risk Communications.

Responsibilities

The following responsibilities can be performed by the APIO for Information Gathering or by a unit composed of several individuals in all or some of the following JIC positions.

- Gather facts. (See *ICS Form 209*, Appendix D)
- Display facts on status boards.
- Monitor the media.
- Analyze and respond to media and social media reports.
- Respond to rumors.

[This Page Intentionally Left Blank]

Fact Gathering Specialist

Position Description

The Fact Gathering Specialist is assigned by the APIO/JIC Manager and reports to the APIO for Information Gathering. The Fact Gathering Specialist is responsible for gathering incident information in the JIC. Personnel selected for this position should possess public affairs and ICS experience. Selected personnel should be able to work quickly, accomplish tasks with only initial direction and function efficiently in a high-stress environment. Personnel should be assigned to this position based on training, experience, skills and ability, not rank or employer.

Position Qualifications

In addition to agency training requirements, the Fact Gathering Specialist is required to complete:

- IS-100 (ICS 100) Introduction to Incident Command System.
- IS-200 (ICS 200) Introduction for Single Resources and Initial Action Incidents.
- IS-700 National Incident Management System, An Introduction.
- IS-800.B National Response Framework, An Introduction.

Responsibilities

- Gather information about the incident from Command staff, the Planning Section's Situation Unit and other appropriate response partners. (See *Information Exchange Matrix 2 –Fact Gathering Specialist*, Appendix C for more details)
- Establish contacts and maintain regular times to pick up information from all sections within the ICS structure.
- Respond rapidly to breaking news and quickly gather information for the other specialists in the JIC.

These responsibilities can be performed by one or more individuals or by a unit composed of several individuals per shift.

Position Specific Functions

Exchanging Information

The Fact Gathering Specialist should contact key response positions face-to-face and establish good working relationships. The Fact Gathering Specialist should continuously obtain and provide information from the various response positions. *Information Exchange Matrix 2 –Fact Gathering Specialist* can be found in Appendix C. This information exchange matrix describes what types of information the Fact Gathering Specialist should obtain from specific response positions within the ICS organization, as well as what information the Fact Gathering Specialist should provide to those same positions.

The APIO/JIC Manager may also assign the Fact Gathering Specialist to complete tasks listed on *Information Exchange Matrix 1 –Public Information Officer,* Appendix C. These tasks focus on information exchanges to the JIC.

[This Page Intentionally Left Blank]

Status Board Specialist

Position Description

The Status Board Specialist is assigned by the APIO/JIC Manager and reports to the APIO for Information Gathering. The Status Board Specialist is responsible for displaying incident information in the JIC. Personnel selected for this position should possess public affairs and ICS experience. Selected personnel should be able to work quickly, accomplish tasks with minimal direction and function efficiently in a high-stress environment. Personnel should be assigned to this position based on training, experience, skills and ability, not rank or employer.

Position Qualifications

In addition to agency training requirements, the Status Board Specialist should complete:

- IS-100 (ICS 100) Introduction to Incident Command System.
- IS-200 (ICS 200) Introduction for Single Resources and Initial Action Incidents.
- IS-700 National Incident Management System, An Introduction.
- IS-800.B National Response Framework, An Introduction.

Responsibilities

- Display incident information on status boards in the JIC so that it is easily accessible to personnel answering inquiries and producing written products.
- Provide all members of the JIC with copies of news releases, fact sheets, current command message(s) and talking points.
- Work with the Planning Section's Display Processor and Situation Unit Leader to maintain JIC information in high traffic areas of the ICP and field locations to keep responders informed.
- Consider available technology to enhance information status boards in the JIC. When electronic displays are used, each must be backed up and archived via hard copy.

These responsibilities can be performed by one or more individuals or by a unit composed of several individuals per shift.

Position Specific Functions

Producing the Status Board

The Status Board Specialist produces status boards in the JIC for all JIC personnel. To assist the Status Board Specialist in producing a status board, *Job Aid 5 –Producing the Status Board* can be found in, Appendix B. *ICS Form 209* is also a useful tool when creating a status board (See Appendix D).

[This Page Intentionally Left Blank]

Media Monitoring and Analysis Specialist

Position Description

The Media Monitoring and Analysis Specialist assesses the content and accuracy of news media reports and assists in identifying trends and breaking issues.

The Media Monitoring and Analysis Specialist provides daily coverage synopses; identifies issues, inaccuracies and view points; and recommends corrections to the APIO for Media Relations. Personnel should be assigned to this position based on training, experience, skills and ability, not rank or employer. (See *Media Analysis Worksheet*, Appendix E)

Position Qualifications

In addition to agency training requirements, the Media Monitoring and Analysis Specialist should complete:

- IS-100 (ICS 100) Introduction to Incident Command System.
- IS-200 (ICS 200) Introduction for Single Resources and Initial Action Incidents.
- IS-700 National Incident Management System, An Introduction.
- IS-800.B National Response Framework, An Introduction.

Responsibilities

- Determine newspaper, radio, television and internet outlets to monitor.
- Gather perceptions from the media, public, the LNO, and other response organizations about the progress of the response efforts.
- Identify potential detrimental rumors and rapidly determine effective ways to deal with them or pass to Rumor Control, if an individual or group of individuals has been designated to process rumors.
- Set up a news clip collection (radio, TV, print and appropriate Internet websites). Request Finance Section to contract a broadcast media monitoring and print clipping service, or set up equipment to record radio and television news and/or to print media websites and blogs.

These responsibilities can be performed by one or more individuals or by a unit composed of several individuals per shift.

Position Specific Functions

Analyzing Information

The Media Monitoring and Analysis Specialist will monitor and analyze the media coverage of the response, as well as the local community's concerns about the response. When appropriate, the Media Monitoring and Analysis Specialist will make recommendations to improve or increase the coverage and accuracy of information in an effort to alleviate concerns and gain community support.

The major activities involved in analyzing information are:

- Attend community meetings.
- Conduct door-to-door surveys.
- Track incoming phone calls and requests.
- Determine media outlets that reach significant diverse audiences.
- Identify potential issues, problems and rumors and report the information immediately to the PIO and appropriate agency or office.

- Identify significant diverse communities and determine the most effective ways to communicate with them (e.g., media, fliers, posters and community meetings).
- Monitor the perceptions of the affected communities concerning the progress of the response.
- Make a record of each print, broadcast and Internet news clip (including a summary of coverage, issues, inaccuracies and view points) using the *Media Analysis Worksheet* (See Appendix E).

Rumor Control Specialist

Position Description

The Rumor Control Specialist receives, verifies and ensures facts are disseminated to dispel incorrect rumors regarding the incident. Personnel should be assigned to this position based on training, experience, skills and ability, not rank or employer.

Position Qualifications

In addition to agency training requirements, the Rumor Control Specialist should complete:

- IS-100 (ICS 100) Introduction to Incident Command System.
- IS-200 (ICS 200) Introduction for Single Resources and Initial Action Incidents.
- IS-700 National Incident Management System, An Introduction.
- IS-800.B National Response Framework, An Introduction.

Responsibilities

- Identify and report any rumors that may cause issues or problems to the APIO for Information Gathering, APIO for Media Relations and APIO for Community Relations.
- Verify the accuracy of the rumor and document results on JIC Rumor Control form. For sources of information on specific guidance, see *Information Exchange Matrix 2 –Fact Gathering Specialist*, Appendix C.
- Report results of each rumor investigation to previously noted APIOs.
- Maintain a file of JIC Rumor Control forms. (See *Query Record*, Appendix E). *ICS Form 213,* Appendix D can also be used to record rumors that are reported to the JIC.

These responsibilities can be performed by one or more individuals or by a unit composed of several individuals per shift.

Position Specific Functions

Validating Rumors

To assist the Rumor Control Specialist with validating rumors *Job Aid 6 –Validating Rumors* can be found in Appendix B.

[This Page Intentionally Left Blank]

3.4 APIO FOR INFORMATION PRODUCTS

Position Description

The APIO for Information Products is assigned by the PIO or APIO/JIC Manager to manage the product development responsibilities of the JIC. Personnel selected for this position should possess some public information, journalism, photography, videography, web management, desktop publishing, ICS and JIC experience. Selected personnel should be able to type, operate a variety of computers and software, work quickly, accomplish tasks with minimal direction and function efficiently in a high-stress environment. Personnel should be assigned to this position based on training, experience, skills and ability, not rank or employer.

Position Qualifications

In addition to agency training requirements, the APIO for Information Products should complete:

- IS-100 (ICS 100) Introduction to Incident Command System.
- IS-200 (ICS 200) Introduction for Single Resources and Initial Action Incidents.
- IS-700 National Incident Management System, An Introduction.
- IS-800.B National Response Framework, An Introduction.

The APIO for Information Products is also recommended to be trained in:

- IS-702 National Incident Management Systems Public Information Systems.
- ICS-300 Intermediate Incident Command System for Expanding Incidents.
- Risk Communications.

Responsibilities

- Produce written news releases, media advisories, public service announcements, fact sheets and other publications.
- Route to PIO for approval all documents, photos, video and other materials (accurate information is essential in preventing public confusion, loss of credibility and/or adverse publicity).
- Establish and manage an incident news website.
- Take and disseminate news photos and video of the incident.
- Produce and gather graphics and logos for the incident.
- Produce incident casebook.

These responsibilities can be performed by the APIO or by a unit composed of several individuals in all or some of the following JIC positions.

[This Page Intentionally Left Blank]

Writer

Position Description

The Writer is assigned by the APIO for Information Products to produce written news releases, media advisories, public service announcements, fact sheets, talking points, emergency public information, voice and text messages, and other direct-to-public information products. Personnel selected for this position should possess strong journalism skills and some public information, ICS and JIC experience. Personnel should be assigned to this position based on training, experience, skills and ability, not rank or employer.

Position Qualifications

In addition to agency training requirements, the Writer should complete:

- IS-100 (ICS 100) Introduction to Incident Command System.
- IS-200 (ICS 200) Introduction for Single Resources and Initial Action Incidents.
- IS-700 National Incident Management System, An Introduction.
- IS-800.B National Response Framework, An Introduction.

Position Specific Functions

Writing a News Release

The Writer should draft and gain approval of a written news release. See *Writing Guidelines for News Releases*, Appendix E for instructions on how to write a news release. Also refer to Appendix E for a *Sample News Release*.

[This Page Intentionally Left Blank]

Imagery Gathering Specialist

Position Description

The Imagery Gathering Specialist is assigned by the APIO/JIC Manager to shoot high quality photos and video for release to the public and media. The Imagery Gathering Specialist reports to the APIO for Information Products. Personnel selected for this position should possess extensive photographic, videographic, electronic photo and video editing and some journalism skills. The Safety Officer may require that the Imagery Gathering Specialist have HAZWOPER certification or wear personal protective equipment in order to photograph or videotape near the hazard site. Selected personnel should be able to operate a variety of digital, still and video cameras, audio recording equipment; accomplish tasks with minimal direction; and function efficiently in a high-stress environment. Personnel should be assigned to this position based on training, experience, skills and ability, not rank or employer.

Position Qualifications

In addition to agency training requirements, the Imagery Gathering Specialist should complete:

- IS-100 (ICS 100) Introduction to Incident Command System.
- IS-200 (ICS 200) Introduction for Single Resources and Initial Action Incidents.
- IS-700 National Incident Management System, An Introduction.
- IS-800.B National Response Framework, An Introduction.

Responsibilities

- Shoot photographs of professional quality.
- Shoot video of broadcast quality.
- Record audio of broadcast quality.
- Catalog and manage all photos, videos and audio recordings.
- Provide all photos, videos, and audio recordings to the Administrative Assistant, the Website Specialist, the Documentation Unit, and the Social Media Specialist.

These responsibilities can be performed by one or more individuals or by a unit composed of several individuals per shift.

Position Specific Functions

Exchanging Information

Information Exchange Matrix 3 –Imagery Gathering Specialist in Appendix C describes what type of information and resources the Imagery Gathering Specialist should obtain from specific response positions, as well as what information the Imagery Gathering Specialist should provide to those same response positions.

The APIO/JIC Manager may also assign the Imagery Gathering Specialist to complete tasks listed on *Information Exchange Matrix 1 –Public Information Officer* in Appendix C. These tasks focus on information exchanges to the JIC.

[This Page Intentionally Left Blank]

Administrative Assistant

Position Description

The Administrative Assistant is assigned by the APIO/JIC Manager to manage additional activities in support of the APIO for Information Products and his/her staff. Personnel selected for this position should be able to accomplish tasks with minimal direction and function efficiently in a high-stress environment. Personnel should be assigned to this position based on training, experience, skills and ability, not rank or employer.

Position Qualifications

In addition to agency training requirements, the Administrative Assistant should complete:

- IS-100 (ICS 100) Introduction to Incident Command System.
- IS-200 (ICS 200) Introduction for Single Resources and Initial Action Incidents.
- IS-700 National Incident Management System, An Introduction.
- IS-800.B National Response Framework, An Introduction.

Responsibilities

- Work with Logistics Section to acquire, set up and run audio/visual support for briefings.
- Provide support for media briefings and community meetings.
- Produce a casebook available in the JIC and/or stored on the internal JIC website.
- Provide all JIC files and products to the Documentation Unit.
- Produce briefing packets.
- Coordinate security needs with the Security Manager of the Facilities Unit in the Logistics Section.
- Catalog, file and copy all JIC materials.
- Maintain media credentialing files.

These responsibilities can be performed by one or more individuals or by a unit composed of several individuals per shift.

Position Specific Functions

Provide Media Briefings/Community Meeting Support

The Administrative Assistant will provide support to the JIC for media briefings and community meetings by coordinating with the Logistics Section. To assist the Administrative Assistant with supporting media briefings/ community meetings, *Job Aid 7 – Providing Media Briefings/Community Meeting Support* can be found in Appendix B and the *Media Briefing/Community Meeting Worksheet* can be found in Appendix E.

Produce a Casebook

A casebook is a compilation of all public information about the incident that can be used for post-incident information requests and evaluations. It provides a case history that can be used as a reference for future events. A printed or electronic copy of the casebook should be made available to each of the JIC's response partners. The casebook should contain:

- All news releases, fact sheets, talking points and key messages generated by the JIC.
- Copies of significant news clips.
- Copies of all JIC-produced videos, photographs, maps and other visuals.

NOTE: The casebook should not include IAPs.

Exchanging Information

Information Exchange Matrix 4 –Administrative Assistant in Appendix C describes what types of materials and resources the Administrative Assistant should obtain from specific response positions, as well as the information the Administrative Assistant should provide to those same response positions.

The APIO/JIC Manager may also assign the Administrative Assistant to complete tasks listed on *Information Exchange Matrix 1 –Public Information Officer* in Appendix C. These tasks deal with information exchanges.

Website Specialist

Position Description

The Website Specialist is assigned by the APIO/JIC Manager to manage all JIC web activities in support of the APIO for Information Products and his/her staff. The Website Specialist may be located in the physical JIC or at a virtual JIC location away from the Command Post. Personnel selected for this position should be knowledgeable of website design software, internet protocols, website accessibility for special needs populations (Section 508 of the Americans with Disabilities Act of 1990); able to accomplish tasks with minimal direction; and function efficiently in a high-stress environment. Personnel should be assigned to this position based on training, experience, skills and ability, not rank or employer.

Position Qualifications

In addition to agency training requirements, the Website Specialist should complete:

- IS-100 (ICS 100) Introduction to Incident Command System.
- IS-200 (ICS 200) Introduction for Single Resources and Initial Action Incidents.
- IS-700 National Incident Management System, An Introduction.
- IS-800.B National Response Framework, An Introduction.

Responsibilities

- Maintain and update incident website.
- Route email inquiries to Media or Community Relations Specialist.
- Ensure approval of all items prior to emailing or posting on the incident website.
- Ensure all items posted to the incident website are Section 508 compliant.
- Establish a virtual JIC, as needed.
- Coordinate with web support personnel for all agencies represented in organization to ensure site meets individual agency requirements.
- Coordinate media and community distribution lists.
- Work with the Social Media Specialist to ensure incident website is linked to the incident social media sites.

These responsibilities can be performed by one or more individuals or by a unit composed of several individuals per shift.

The IC/UC should designate one official website to represent the response efforts, provide answers to the public's questions and address issues raised through other media sources. After a case is closed and the JIC demobilizes, the PIO should consider monitoring continued interest and keeping the website online longer than a few months.

Responders should monitor the information being posted on other websites. Questions, concerns or misinformation found on other websites should be addressed on the official website.

[This Page Intentionally Left Blank]

3.5 APIO FOR MEDIA RELATIONS

Position Description

The APIO for Media Relations is assigned by the PIO or APIO/JIC Manager to coordinate the release of information to the media.

Personnel selected for this position should possess experience in public information, crisis response, JIC operations, management and ICS, as well as have demonstrated skills in interacting with the media. Personnel should be assigned to this position based on training, experience, skills and ability, not rank or employer.

Position Qualifications

In addition to agency training requirements, the APIO for Media Relations should complete:

- IS-100 (ICS 100) Introduction to Incident Command System.
- IS-200 (ICS 200) Introduction for Single Resources and Initial Action Incidents.
- IS-700 National Incident Management System, An Introduction.
- IS-800.B National Response Framework, An Introduction.

The APIO for Media Relations is also recommended to be trained in:

- IS-702 National Incident Management Systems Public Information Systems.
- ICS-300 Intermediate Incident Command System for Expanding Incidents.
- Risk Communications.

Responsibilities

- Respond to media inquiries.
- Select and prepare speakers prior to interviews.
- Conduct news briefings and interviews.
- Provide escorts to the media.
- Credential media.
- Maintain multi-lingual capabilities, if necessary.
- Maintain and update media lists.
- Identify misinformation or rumors.

These responsibilities can be performed by the APIO or by a unit composed of several individuals in all or some of the following JIC positions.

[This Page Intentionally Left Blank]

Media Relations Specialist

Position Description

The Media Relations Specialist is assigned by the APIO/JIC Manager to manage the distribution of information regarding the event. Personnel selected for this position should have experience interacting directly with the media, be able to speak clearly and concisely, be able to accomplish tasks with minimal direction and function efficiently in a high-stress environment. Depending on the region, bilingual personnel may be needed in this unit. Personnel should be assigned to this position based on training, experience, skills and ability, not rank or employer.

Position Qualifications

In addition to agency training requirements, the Media Relations Specialist should complete:

- IS-100 (ICS 100) Introduction to Incident Command System.
- IS-200 (ICS 200) Introduction for Single Resources and Initial Action Incidents.
- IS-700 National Incident Management System, An Introduction.
- IS-800.B National Response Framework, An Introduction.

The Media Relations Specialist is also recommended to be trained in:

- Risk Communications.

Responsibilities

- Determine media outlets.
- Produce detailed accounts of calls, including name and organization, phone number, nature of inquiry and result. (See *Query Record*, Appendix E)
- Maintain a comprehensive and current media list containing points of contact, phone, pager, cellular and fax numbers and e-mail and postal addresses.
- Disseminate approved written material to the media.
- Staff the phones with people able to answer calls, possibly in more than one language, from local, state, national and international media.
- Respond to routine inquiries using talking points, speaker preparation, news releases and fact sheets.
- Promote story and feature ideas to target media.
- Establish a daily drive-time call-out schedule that meets local radio and television deadlines. This will vary with each incident.
- Document the time and details of the response; track inquiries to ensure response and closure within a timely manner (ideally, less than one hour).

These responsibilities can be performed by one or more individuals or by a unit composed of several individuals per shift.

[This Page Intentionally Left Blank]

Speaker Support Specialist

Position Description

The Speaker Support Specialist is assigned by the APIO/JIC Manager to manage the coordination of meetings, interviews and engagements. The Speaker Support Specialist reports to the APIO for Media Relations. Personnel selected for this position should have good interpersonal skills, the ability to accomplish tasks with minimal direction and function efficiently in a high-stress environment. In addition, personnel may need to be bilingual. Personnel should be assigned to this position based on training, experience, skills and ability, not rank or employer.

Position Qualifications

In addition to agency training requirements, the Speaker Support Specialist should complete:

- IS-100 (ICS 100) Introduction to Incident Command System.
- IS-200 (ICS 200) Introduction for Single Resources and Initial Action Incidents.
- IS-700 National Incident Management System, An Introduction.
- IS-800.B National Response Framework, An Introduction.

The Speaker Support Specialist is also recommended to be trained in:

- Risk Communications.

Responsibilities

- Identify, schedule and prepare appropriate personnel and subject matter experts for news briefings and media interviews.
- Advise the PIO and APIO/JIC Manager on times for news briefings.
- Coordinate with the Administrative Assistant about set-up and audiovisual needs for news briefings and media interviews.
- Schedule and coordinate Editorial Board.

These responsibilities can be performed by one or more individuals or by a unit composed of several individuals per shift.

Position Specific Functions

Speaker Preparation

The Speaker Support Specialist should prepare personnel for speaking to the general public and media during phone interviews, on-camera interviews and news briefings. See the *Speaker Preparation Worksheet* in Appendix E.

Media Briefings

The Speaker Support Specialist should identify spokespersons for scheduled media briefings. (See *Spokesperson Request Worksheet*, Appendix E) When setting up and conducting media briefings, refer to the *Media Briefing Worksheet*, Appendix E. Personnel from nearly all positions in the JIC will play some part in this process.

Editorial Board

An Editorial Board is a meeting between the IC/UC and an editor from a media organization in which reporters may or may not be present. Usually an Editorial Board meeting is not conducted until several days into an incident, but may need to occur sooner based on the needs of the incident. The Editorial Board meeting serves the following functions:

- Provides the IC/UC a chance to explain in broad terms the policies and positions of the command.

- Provides the editor with a chance to ask questions about IC/UC's policies and positions as they pertain to the response.
- Is normally held in the offices of the editor and typically does not result in a story; it is intended to be used for background in future stories.

Field Specialist

Positions Description

The Field Specialist is assigned by the APIO/JIC Manager to provide media relations and other JIC support in the field. Depending on the region, bilingual personnel may be needed. Personnel should be assigned to this position based on training, experience, skills and ability, not rank or employer.

Position Qualifications

In addition to agency training requirements, the Field Specialist should complete:

- IS-100 (ICS 100) Introduction to Incident Command System.
- IS-200 (ICS 200) Introduction for Single Resources and Initial Action Incidents.
- IS-700 National Incident Management System, An Introduction.
- IS-800.B National Response Framework, An Introduction.

Responsibilities

- Coordinate with the Safety Officer to ensure it is safe to escort others to the incident scene.
- Ensure media are properly equipped and informed. (See *Field Escort Equipment and Communications Checklist,* Appendix E)
- Escort media to incident scene or other field locations.

Based on the needs of the incident, the Field Specialist may be assigned additional responsibilities, such as:

- Take photos and video of incident scene.
- Gather facts from incident scene.
- Disseminate approved incident information to members of the media and public.

These responsibilities can be performed by one or more individuals or by a unit composed of several individuals per shift.

[This Page Intentionally Left Blank]

3.6 APIO FOR COMMUNITY RELATIONS

Position Description

The APIO for Community Relations is assigned by the PIO/JIC Manager to monitor the community's concerns regarding the incident, advise the PIO about community information needs, and coordinate release of information to the public.

Personnel selected for this position should possess community relations, crisis response, JIC, operations, management and ICS experience, as well as have demonstrated skills in interacting with the public. Personnel should have experience identifying different publics/stakeholders, and using interviews to ascertain community knowledge, attitudes and behaviors. Personnel should also have good interpersonal skills, risk communications experience, the ability to accomplish tasks with minimal direction and function efficiently in a high-stress environment. Personnel should be assigned to this position based on training, experience, skills and ability, not rank or employer.

Position Qualifications

In addition to agency training requirements, the APIO for Community Relations should complete:

- IS-100 (ICS 100) Introduction to Incident Command System.
- IS-200 (ICS 200) Introduction for Single Resources and Initial Action Incidents.
- IS-700 National Incident Management System, An Introduction.
- IS-800.B National Response Framework, An Introduction.

The APIO for Community Relations is also recommended to be trained in:

- IS-702 National Incident Management Systems Public Information Systems.
- ICS-300 Intermediate Incident Command System for Expanding Incidents.
- Risk Communications.

Responsibilities

When appropriate, work with the LNO to:

- Determine the information needs of the community.
- Develop and coordinate community outreach programs.
- Establish contact with influential local community members that can provide feedback about how the response is perceived.
- Determine the need for and format of community meetings.
- Conduct and/or participate in community meetings.
- Canvass the local community for feedback and to disseminate incident information. (See *Opening Statement for Community Relations Interviews,* Appendix E).
- Develop posters, fliers, newsletters and other community outreach materials.
- Inform the public of volunteer opportunities coordinated by the Volunteer Coordinator, LNO and assisting agencies.
- Respond to community inquiries.

These responsibilities can be performed by the APIO or by a unit composed of several individuals in all or some of the following JIC positions.

Community Relations Specialist

Position Description

The Community Relations Specialist is assigned by the APIO/JIC Manager to document and respond to community inquiries. Personnel selected for this position should have experience interacting directly with the community, speaking clearly and concisely, accomplishing tasks with minimal direction and functioning efficiently in a high-stress environment. Personnel should also have experience identifying different publics/stakeholders, and using interviews to ascertain community knowledge, attitudes and behaviors. Depending on the region, multilingual personnel may be needed in this unit. Personnel should be assigned to this position based on training, experience, skills, and ability, not rank or employer.

Position Qualifications

In addition to agency training requirements, the Community Relations Specialist should complete:

- IS-100 (ICS 100) Introduction to Incident Command System.
- IS-200 (ICS 200) Introduction for Single Resources and Initial Action Incidents.
- IS-700 National Incident Management System, An Introduction.
- IS-800.B National Response Framework, An Introduction.

The Community Relations Specialist is also recommended to be trained in:

- Risk Communications.

Responsibilities

- Identify communities affected by the incident.
- Produce detailed accounts of calls, including name and organization, phone numbers, nature of inquiry and results.
- Determine how well community members comprehend command objectives/messages and make recommendations for corrective actions through the APIO for Community Relations.
- Determine community attitudes toward the incident and response organization and recommend actions to encourage/change those attitudes, as necessary.
- Debrief APIO/JIC Manager following a community meeting. Note major issues of concern and provide recommendations for future action.
- Determine community behaviors related to the incident situation and recommend actions to encourage protective or corrective behavior.
- In conjunction with the LNO, maintain a comprehensive and current list of interested stakeholders, including phone and fax numbers or e-mail addresses.
- Disseminate approved written material to the community.
- Staff the phones with people able to answer calls, possibly in more than one language, from the community.
- Respond to routine inquiries using talking points, frequently asked questions, news releases, fact sheets and other community relations materials.
- Route inquiries about volunteer opportunities to the Volunteer Coordinator, LNO, or LSC.

These responsibilities can be performed by one or more individuals or by a unit composed of several individuals per shift.

[This Page Intentionally Left Blank]

Community Support Specialist

Position Description

The Community Support Specialist is assigned by the APIO/JIC Manager to manage the coordination of meetings, interviews and engagements. The Community Support Specialist reports to the APIO for Community Relations. Personnel selected for this position should have good interpersonal skills, the ability to accomplish tasks with minimal direction and function efficiently in a high-stress environment. Personnel should be assigned to this position based on training, experience, skills and ability, not rank or employer.

Position Qualifications

In addition to agency training requirements, the Community Support Specialist should complete:

- IS-100 (ICS 100) Introduction to Incident Command System.
- IS-200 (ICS 200) Introduction for Single Resources and Initial Action Incidents.
- IS-700 National Incident Management System, An Introduction.
- IS-800.B National Response Framework, An Introduction.

Responsibilities

- Identify, schedule and prepare appropriate personnel and subject matter experts for community meetings.
- Advise the PIO and APIO/JIC Manager on times for community meetings.
- Coordinate with the Administrative Assistant about set-up and audiovisual needs for community meetings.
- Participate in meetings hosted by the community.

These responsibilities can be performed by one or more individuals or by a unit composed of several individuals per shift.

Position Specific Functions

Speaker Preparation

The Community Support Specialist should prepare personnel for speaking at community meetings. See the *Speaker Preparation Worksheet*, Appendix E.

Community Meetings

The Community Support Specialist should set up community meetings. To assist the Community Support Specialist with preparing for a community meeting, *Job Aid 8 –Conducting Community Meetings* can be found in Appendix B.

[This Page Intentionally Left Blank]

Social Media Specialist

Position Description

The Social Media Specialist is assigned by the APIO/JIC Manager to distribute information regarding the event and interact with the public via approved social media channels. Personnel selected for this position should have experience communicating appropriately in various social media platforms, and should be able to accomplish tasks with minimal direction and function efficiently in a high-stress environment. Depending on the community, bilingual personnel may be needed in this unit. Personnel should be assigned to this position based on training, experience, skills and ability, not rank or employer.

Position Qualifications

In addition to agency training requirements, the Social Media Specialist should complete:

- IS-100 (ICS 100) Introduction to Incident Command System.
- IS-200 (ICS 200) Introduction for Single Resources and Initial Action Incidents.
- IS-700 National Incident Management System, An Introduction.
- IS-800.B National Response Framework, An Introduction.

The Social Media Specialist is also recommended to be trained in:

- Risk Communications.

Responsibilities

- Conduct regular analysis of social media outreach success and report current trends to the APIO/JIC Manager.
- Work with APIO for Community Relations, JIC Manager, and PIO to establish appropriate release authority unique to the two-way, real time communications necessary for successful and credible social media engagement.
- Monitor social media sites and identify trends and interact appropriately.
- Disseminate validated facts.
- Drive traffic to incident news sites or other reliable sources.
- Ensure all incident social media sites are linked to the incident website.
- Ensure that all social media sites are archived and delivered to the Documentation Unit in accordance with their guidance.

These responsibilities can be performed by one or more individuals or by a unit composed of several individuals per shift.

Position Specific Functions

Analyzing Information

The Social Media Specialist will monitor and analyze social media activity about the response. The *Social Media Analysis Worksheet* in Appendix E can be used for analyzing and identifying potential solutions for social media coverage and activity. When appropriate, the Social Media Specialist will make recommendations or act to alleviate concerns and gain community support.

The major activities involved in analyzing information are:

- Monitor the activity of the social media communities posting about the response.
- Track response information that is a trending/popular topic on a particular site to monitor additional information and interact accordingly.

[This Page Intentionally Left Blank]

Appendix A: NRT JIC and ESF #15 Operations During a Federal Response

The term "Incident Command Post Public Information Officer (ICP PIO)" in this Appendix refers to the Public Information Officer who is delegated by a Federal On-Scene Coordinator/Incident Commander to carry out public information duties at the Incident Command Post level (see Figure 8, page 13). The guidance in this Appendix is not exclusive to communicators assigned to a JIC using the NRT Model; rather, the concepts discussed here should be considered by communicators assigned to any Incident Command Post-level JIC, as well as those assigned to an ESF #15.

The National Oil and Hazardous Substances Pollution Contingency Plan, more commonly called the National Contingency Plan (NCP), describes the national preparedness and response system for oil spills and hazardous materials releases.

In response to incidents that fall under the jurisdiction of the NCP, the U.S. Coast Guard or U.S. Environmental Protection Agency will provide a Federal On-Scene Coordinator (FOSC) who directs and manages response activities. The FOSC designates one Incident Command Post Public Information Officer (ICP PIO) who is a member of the Command Staff and is responsible for developing and releasing information about the incident to the news media, affected publics, and incident personnel. The ICP PIO serves as principle advisor to the FOSC for public information matters (***see Section 2.1, 2.2, 3.1***). Communicators working in public information under a NCP response use the National Response Team's Joint Information Center Model to communicate with affected publics.

Conversely, the National Response Framework (NRF) outlines the Federal government's guiding principles that enable all response partners to prepare for and provide a unified national response to disasters and emergencies. It is subdivided into specific mission support areas, or Emergency Support Functions (ESFs), which group Federal resources and capabilities into functional areas to serve as the primary mechanisms for providing assistance at the operational level.

ESF #15 of the NRF is activated when the Department of Homeland Security Assistant Secretary for Public Affairs determines an incident is complex enough to require a coordinated interagency communication effort. Under the ESF #15 construct, an External Affairs Officer (EAO) is assigned for each of its functional areas. These functional areas are organized differently than the NRT JIC functional areas and may result in misunderstanding of the responsibilities and authorities of each construct.

NRT JICs are often established prior to, as well as concurrently with, the establishment of ESF #15. Following Deepwater Horizon, a 2011 NCP-NRF Alignment Working Group discovered that some of the challenges communicators faced arose from a lack of understanding of the relationship between a NRT JIC and ESF #15 when both constructs were activated.

As a result, the Working Group recommended the roles be clarified in order to improve communication efforts during future events:

- **ESF #15 is intended to *support* existing response communication efforts, not direct them.** They do this by providing additional coordination mechanisms and additional resources to support a national communications effort (e.g., Congressional Affairs and the White House).

- **NRT JICs are not meant to be absorbed into the ESF #15 organizational structure.** This is due to the fact that ESF #15's focus is strategic with some operational elements, while NRT JICs are purely tactical, with some strategic communication functions focused on command-post level operations.

- **To achieve unity of effort and facilitate message alignment:**
    - When ESF #15 is activated, the NRT JIC and the ICP PIO retain the information release authority delegated to them by their respective FOSC/Incident Commander; ICP PIO & NRT JIC responsibilities/roles do not end with the implementation of Federal ESF #15 activities.
    - A regular line of communication should be established from the ICP PIOs by means of the NRT JIC to the ESF #15 Deputy EAO or EAO to exchange information and requests for support.
    - Specifically how and where the NRT JIC connects with the ESF #15 construct is established by the ICP PIO and the ESF #15 EAO based on the needs of the response.

Appendix B: Job Aids

Position	Job Aid	Description
Public Information Officer	1. Establishing the Initial Response	This Job Aid includes tasks that the PIO must accomplish prior to and in preparation for the establishment of a JIC.
	2. Establishing a JIC	This Job Aid includes tasks to assist the PIO in establishing and managing a JIC.
	3. Demobilizing a JIC	This Job Aid includes tasks to assist the PIO with demobilization activities applicable to all personnel assigned to the JIC.
Assistant Public Information Officer/JIC Manager	4. Developing the Operating Schedule	This Job Aid assists the APIO with developing the operating schedule.
Status Board Specialist	5. Producing the Status Board	This Job Aid assists the Status Board Specialist with producing the status board.
Rumor Control Specialist	6. Validating Rumors	This Job Aid assists the Rumor Control Specialist with validating rumors that arise.
Administrative Assistant	7. Providing Media Briefings/ Community Meeting Support	This Job Aid assists the Administrative Assistant in coordinating with the Logistics Section to provide support for media briefings and community meetings.
Administrative Assistant	8. Conducting Community Meetings	This Job Aid assists the Community Support Specialist and Administrative Assistant in planning for and conducting community meetings.
Social Media Specialist	9. Social Media in a Response	This Job Aid includes tasks associated with using social media in a response.

[This Page Intentionally Left Blank]

JOB AID 1 – ESTABLISHING THE INITIAL RESPONSE

STEP	ACTION	✓
1.	Check in and obtain initial briefing from IC/UC.	☐
2.	Establish a dedicated phone line and website for providing information and managing telephone and e-mail inquiries from the media, stakeholders and general public.	☐
3.	Gather basic facts about the incident – who, what, where, when, why and how.	☐
4.	Use gathered facts to answer inquiries.	☐
5.	Activate the following positions as needed: ☐ Media Relations Assistant 1. Use dedicated phone to answer calls from media, stakeholders and public. 2. Record names, phone numbers and organization of the callers; also note date/time of calls, nature of inquiries and deadlines for receiving additional information. (See *Query Record* in Appendix E) 3. Use approved news releases and gathered facts to answer media calls. (See *Sample Documents* in Appendix E) ☐ Information Gathering Assistant 1. Gather verified incident information from sources throughout the response organization. (See *ICS Form 209* in Appendix D) 2. Provide this information to the assistants handling inquiries and writing news releases. ☐ Information Products Assistant 1. Assemble gathered facts into two or three sentences that answer who, what, when, where, why and how of incident. (See *Sample Documents* in Appendix E) **NOTE**: Answering the "why" and "how" at many incidents is difficult or impossible to accomplish (e.g., these facts may only come out after an investigation). 2. List remaining facts and information in bullet form. (List responding agencies, type and amount of equipment, etc.) **NOTE:** News releases should be only one page in length. If there is a need for additional information about specific topics, then a separate fact sheet should be made. 3. Spell check and edit news releases and give to PIO for editing, approval and routing to the IC/UC for final approval. 4. Give approved news releases to Media Relations Assistant. 5. Distribute news releases to news media and other requestors. 6. Develop three key messages as soon as information is gathered.	☐ ☐
6.	Select a location for the JIC. The location should meet the following criteria: • Enough space for everyone to work based on personnel resource requests. • Enough AC outlets and/or power strips, used within fire codes. • Access to a photocopier. • Access to a computer and/or access to the Internet. • Access to phone lines. • Access to a fax machine. • Located at or near the ICP or Emergency Operations Center (EOC).	☐
7.	Call for more assistance, preferably people trained in public information, JIC and ICS operations. Make requests for additional resources via the Logistics Section.	☐

[This Page Intentionally Left Blank]

JOB AID 2 – ESTABLISHING A JIC

STEP	ACTION	✓
1.	Conduct transition meeting with initial PIO.	☐
2.	Appoint someone experienced as APIO/JIC Manager, who can meet the responsibilities and achieve the position goals as listed in the NRT JIC Model.	☐
3.	Appoint someone experienced as APIO for Information Gathering who can meet the responsibilities and achieve the position goals as listed in the NRT JIC Model.	☐
4.	Appoint someone experienced as APIO for Information Products who can meet the responsibilities and achieve the position goals as listed in the NRT JIC Model.	☐
5.	Appoint someone experienced as APIO for Media Relations who can meet the responsibilities and achieve the position goals as listed in the NRT JIC Model.	☐
6.	Appoint someone experienced as APIO for Community Relations who can meet the responsibilities and achieve the position goals as listed in the NRT JIC Model.	☐
7.	Use the NRT JIC Model to ensure all PIO responsibilities are being performed.	☐

[This Page Intentionally Left Blank]

JOB AID 3 – DEMOBILIZING A JIC

STEP	ACTION	✓
1.	Receive Demobilization Plan from Planning Section Chief (PSC) or Demobilization Unit Leader.	☐
2.	Brief personnel regarding demobilization. Debrief appropriate personnel prior to departing incident: • IC/UC • PSC • LSC • Incoming/outgoing JIC personnel	☐
3.	Supervise demobilization of unit, including inventory, return and storage of equipment and supplies.	☐
4.	Forward all Section/Unit documentation to PSC or Documentation Unit Leader.	☐
5.	Supervisors to complete Incident Personnel Performance Rating (ICS 225); all individuals complete Check-out Sheet.	☐
6.	Notify media and other stakeholders when JIC will demobilize, whether virtual JIC website will continue to be updated and which agency or organization PIOs to contact for any future inquiries or updates.	☐

[This Page Intentionally Left Blank]

JOB AID 4 – DEVELOPING THE OPERATING SCHEDULE

STEP	ACTION	✓
1.	Conduct transition briefing between shifts. (See Daily Checklist and Daily JIC Brief Worksheet, Appendix E.) NOTE: Conduct daily morning and evening JIC staff briefings.	☐
2.	Review Self-Assessment Survey completed by new JIC staff members and assign to appropriate roles and work hours.	☐
3.	Coordinate with PSC regarding Daily Meeting Schedule (ICS Form 204) of Command and General Staff briefings and meetings.	☐
4.	Coordinate with the APIO for Information Products to set deadlines for writing, approval and dissemination of all information products.	☐
5.	Coordinate with the APIO for Media Relations and Speaker Support Specialist to set the schedule of media briefings, community meetings, media/VIP tours and other JIC events, including deadlines for speaker preparation.	☐
6.	If ESF #15 is activated, establish a regular line of communication with the ESF #15 Deputy EAO or EAO and connections, as appropriate, between ESF #15 and the NRT JIC. (See NRT JIC and ESF #15 operations during a Federal response, Appendix A.)	
7.	Gather Command Message(s) for the APIO for Information Products from the PIO and IC/UC.	☐
8.	Coordinate with PIO and JIC staff on messages and strategies for reaching target audiences.	☐
9.	Deliver media analysis to PIO.	☐
10.	Ensure preparation for news briefings.	☐

[This Page Intentionally Left Blank]

JOB AID 5 – PRODUCING THE STATUS BOARD

STEP	ACTION	✓
1.	Contact PSC or Situation Unit Leader to obtain latest ICS Form 209 Status Summary.	☐
2.	Meet with key response positions and post obtained information in the JIC.	☐
3.	Display current news releases, fact sheets and incident news clips in physical JIC on status board or data projectors and/or in virtual JIC website for Command and JIC staff to view.	☐
4.	Display non-incident/morale boosters – other news, sports, comics, local restaurant menus, etc.	☐
5.	Coordinate with Planning Section's Display Processor to identify high-traffic locations to post JIC products in the ICP (break rooms, main hallways, etc.) visible to other responders.	☐
6.	Update boards as needed, including after each Operations Briefing.	☐

[This Page Intentionally Left Blank]

JOB AID 6 – VALIDATING RUMORS

STEP	ACTION	✓
1.	The Rumor Control Specialist receives rumor from someone in other response position (e.g., Media Relations Specialist or Community Relations Specialist). NOTE: Rumors can be received by anyone from many different means – by field workers through interaction with the public, by other JIC members who work with the media, etc. Intake of rumors to the JIC may be via telephone, face-to-face interaction, via ICS Form 213 General Message, or other means.	☐
2.	The Rumor Control Specialist documents received rumor and all amplifying information on JIC Query Record (See Appendix E).	☐
3.	The Rumor Control Specialist seeks out appropriate response organization subject matter expert to validate/invalidate received rumor (e.g., Situation Unit Leader (SITL) for collected incident data or LNO for list of assisting agencies).	☐
4.	The Rumor Control Specialist records validated fact on Rumor Query Record.	☐
5.	The Rumor Control Specialist provides copies of completed form to the following JIC personnel: • APIO for Information Gathering (for posting and media analysis, if necessary); • APIO for Information Products (to correct any previously released or draft information products, to correct any information posted to incident website and for filing in JIC records); • APIO for Media Relations (for dissemination to the media); and • APIO for Community Relations (for dissemination to the public).	☐

[This Page Intentionally Left Blank]

JOB AID 7 – PROVIDING MEDIA BRIEFINGS/COMMUNITY MEETING SUPPORT

STEP	ACTION	✓
1.	Secure a space for the event.	☐
2.	Provide and set up chairs, tables and lectern.	☐
3.	Set up microphone and public address system, if necessary.	☐
4.	Set up supporting graphic material near spokespersons.	☐
5.	Set up overhead projector, televisions/VCRs and/or computers for supporting visuals.	☐

[This Page Intentionally Left Blank]

JOB AID 8 – CONDUCTING COMMUNITY MEETINGS

STEP	ACTION	✓
1.	Select the appropriate time for the exhibit/community meeting. NOTE: The end of the working day is best. Tuesday and Thursday have proven to generate greater attendance.	☐
2.	Select an appropriate meeting format, e.g., open house, audiovisual presentation, or panel discussion. (See *Public Exhibit and Discussion Diagram*, Appendix E.)	☐
3.	Select and schedule an appropriate location. NOTE: The location should be easily accessible, contain plenty of parking, power and minimal background noise.	☐
4.	Coordinate security needs with the Security Manager of the Facilities Unit in the Logistics Section for community meetings.	☐
5.	Select appropriate Subject Matter Experts as presenters/speakers at the exhibit /community meeting. Consider designating a member of the IC/UC to give opening remarks, if appropriate.	☐
6.	Notify the community of the event.	☐
7.	Identify exhibitors from the IC/UC, schedule and conduct speaker preparation and provide assistance with materials for exhibits.	☐
8.	Debrief APIO/JIC Manager following a community meeting. Note major issues of concern and provide recommendations for future action.	☐

[This Page Intentionally Left Blank]

JOB AID 9 – SOCIAL MEDIA IN A RESPONSE

STEP	ACTION	✓
1.	Obtain a stand-alone computer with internet connectivity. a. If a response website has been created, then obtain administrator privileges. b. If a response website does not exist, work with Website Specialist to create a response website.	☐
2.	Create a Gmail and Yahoo! Account	☐
3.	Create Twitter Account a. If an organizational YouTube Account exists, then obtain administrator privileges. b. If an account doesn't exist, create a YouTube account.	☐
4.	Create a Flickr Account.	☐
5.	Create Blog.	☐
6.	Obtain approval from APIO Information Products or JIC Manager of design/base content of Social Media sites.	☐
7.	Share Links.	☐

Is Social Media Right for the Response?

Early in the response, the PIO should establish unified command level of comfort with using social media and make recommendations based on the needs of the response. Consider the following:

- The use of social media should support the IC/UC communication goals, not drive them. As the PIO considers people who need information about the response, sometimes social media is a great way to communicate, but sometimes it is not.
- Social media is a dialogue with the public as an information dissemination and engagement tool. It should be used as a two-way communication tool and not as a mechanism to "push" information. Be prepared to engage and respond to comments and concerns in a timely manner.
- Social media efforts should closely align with JIC operations so that information is being released online in concert with public and media interests. Therefore, the Social Media Specialist should be located in the JIC and work under the APIO for Community Relations.
- The PIO should socialize the intent and basic plan to use social media up and down the chain of command for concurrence. Inform IC/UC that a more formal plan will be provided before launching response sites.

Develop a Social Media Implementation Plan

This section outlines a content management plan for social media sites and outlines how content will be gathered, developed, repurposed and released on social media.

Consider the following:

- What effect are you trying to achieve by putting information out?
- What content can be posted? What content cannot be posted?
- Will you get original content? Will you be considered as a source for breaking news?
- Can you post non-official (other news media) content?
- What content will be consistently and readily available? (e.g. daily news releases, status reports, operational summaries, multimedia products, etc.)
- Keep an open mind and seek other content to post online.

Outline who has release authority and how the chain of approval for publishing content will flow. This may require varying levels based on the type of content (i.e. original, repurposed, imagery, etc.). This

section is essential to avoid unnecessary delays in the posting of information and ensures maximum disclosure, minimum delay.

Determine how social media efforts will be evaluated. Social media can be used to create valuable reports for the response leadership. The following shall be considered:

- Analyze comments to determine gaps in public understanding and awareness of response operations and status. (*See Appendix E: Social Media Analysis Worksheet*)
- Track trending topics, arising issues and misperceptions.
- Use the metric systems for each social media tool to produce quantitative and qualitative reports on engagement.

How to Create Social Media Email Accounts

This section outlines the various social media accounts available and how to create an account. Careful consideration should be made when choosing which social mediums to engage in.

Gmail

(These accounts will be used to create all social media accounts).

1. Go to the Google homepage.
2. Click the "Sign In" link at the top right of the screen and "Create an account."
3. Fill in the appropriate boxes: "First Name," "Last Name" and "Desired Login Name." *(Name each account created (login/username) the same as the response website name if possible).*
4. Choose and confirm a password.
5. Fill out the remainder of the form with a security question (which will help you if you forget your password), a secondary email (if you have one), location and word verification.
6. Click on the button marked "I accept. Create My Account."

Yahoo!

(These accounts will be used to create all social media accounts).

1. Go to the Yahoo! homepage.
    a. Click on "Sign Up" on the right side of the screen
    b. Fill in the appropriate boxes then click "Create My Account" *(Name each account created (login/username) the same as the response website name if possible).*

Facebook

The following tips can help develop your response Facebook page.

1. Establish a vanity URL for your page. Go to www.facebook.com/username and use the drop-down menu to select a name for the response page.
2. Use the "link" and "upload" options. Compliment the link or photo upload using the "status" field to add an authentic note and entice readership/engagement.
3. Link to relevant regional or national news stories, blog posts, press releases or web sites that post about the response.
4. Make sure to carefully consider copyright issues and intellectual property rights when using other sources of information.
5. Post current/upcoming events or safety/security zones, interesting facts, personal messages or quotes from response leadership and other items of interest to the response on the wall.
6. Use the "Notes" option to post blog-type stories.

7. Closely monitor comments and engage when appropriate. Always interact as an official spokesperson and be sure to follow the SOP and policy and practice full disclosure of who you are and your affiliation with the response.
8. Engage on other official pages and the pages of various stakeholders. Consider yourself an official spokesperson and be sure to follow the SOP and policy and practice full disclosure of who you are and your affiliation with the response.

Twitter

The following tips can help develop your microblog.

1. Send short snippets about breaking news, countdowns, case updates, "As-It-Happens" updates, ask questions, "did you knows," hot-off-the-press information, picture of the day, things to know, area familiarization information, unit stats, etc.
2. Be clever and unique, drawing the reader in so they want to click the link or re-post your message.
3. Send pictures using the photo upload option or third party services like Twitpic.
4. Follow other federal, state or local Twitter accounts and re-post (e.g. Re-tweet (RT)) as appropriate.
5. Reply as appropriate to mentions.
6. Use unique hashtags to help people follow your updates (e.g. #2011floods, #opsail2012)
7. Use third party microblog services to easily manage your site (e.g. www.tweetdeck.com or www.hootsuite.com).
8. Use a URL shortener that has a privacy policy (we suggest using goo.gl).

Creating an Account

1. Go to www.Twitter.com and click on the "Get Started-Join!" button.
2. Fill out the blanks. Create a username and password that is similar to the response website created by the PIO. Twitter will automatically check the availability of your username. Enter your email address and continue.
3. After you create your account, you can manually see if any of your e-mail contacts are on Twitter. Just enter your e-mail username and password, and Twitter will automatically import anyone it recognizes.
4. Uncheck "Select All" box on the "Look who else is here" page or skip the step.
5. Go to Profile and click on Add a Photo. Click the "Choose File" button and search for Icon image designed for response.
6. If setting up a phone is available at the response then go to the "Devices" tab on your profile page and then enter your cell phone number. A confirmation message will be sent to your phone, and then you'll be able to make your first update.

YouTube

1. Go to www.YouTube.com
2. Click the "Sign Up" link.
3. Select a username for the site (use the name of the response if possible) and follow YouTube instructions.
4. To embed a video on a response site, first upload a video to YouTube and then click on the video to view it. Copy and paste the "Embed" code to wherever you want it: blog, etc.

Flickr

1. Go to www.flickr.com
2. Click "Create Your Account."
3. Fill out the required fields. Required fields are the ones with the * symbol beside them.

Uploading Images[3]

1. Click the "upload photos" button.
2. You will be prompted to choose the photo you want to upload. Click the "choose photos" button and select the location where your picture is located on your computer.
3. Now that your photo is uploaded, click the "add titles and descriptions" buttons to add text to your picture.
4. Be sure to add photos to a set. This is necessary to create a slideshow.

Flickr to Twitter

1. Go to www.Flickr.com
2. Log in to newly created account.
3. Click on "You" and select "Your Account."
4. Click on "Extending Flickr."
5. Scroll down to "Your blogs" and click "Edit."
6. Add response Twitter account and Blogger account from drop down menu.
7. Now all photos uploaded to Flickr can be disseminated via Twitter or posted to Blog.

Blog

The following tips can help develop your blog writing style.

- Style of writing should be conversational, fun and engaging, but appropriately serious to the situation. Blog writing is similar to feature writing style.
- Use your insider access to take the reader behind the scenes. For example, get a quote from a person involved or a unique picture only available on your site.
- Find a personal and interesting angle to the story. Answer the "what's in it for me, the reader?"
- Turn a photo caption into a story with quotes and updates about the operation.
- To establish readership and credibility, blog managers should post frequently. Pre-establish content that can be posted regularly like status updates, maps, imagery, daily summaries, etc. If content or ideas are lacking, consider providing more in-depth stories about response operations or tactics (e.g. oil skimmers during a pollution response, claims processes during disasters or resources available at local shelters).
- At times, a cross-post of a relevant regional or national news story may be appropriate. Try not to favor any one news outlet and be careful of inappropriate endorsements. It may be best to write a short introduction and include a quote from leadership to provide a command message, and then link to the story.
- Make sure to carefully consider copyright issues and intellectual property rights when using other sources of information.
    - Go to www.blogger.com
    - Click on "Create a Blog."
    - Fill in the appropriate fields[4]

[3] Recommend using Flickr Uploadr - a good tool for uploading a group of images from a desktop (Mac & PC).

[4] Blogger allows up to 10 email addresses to be added for notifications of a new blog entry (click Settings, Email & Mobile).

TwitterFeed

How to set up RSS feed from PIER to Twitter using TwitterFeed

1. Go to www.TwitterFeed.com and create an account.
2. Set up a TwitterFeed account using Google (Gmail account). Use the URL for the RSS feed for Recent Updates on the PIER site:
   Example: http://www.piersystem.com/go/feed/**SITE_NUMBER**/ru/rss20
   1. Add that Feed to your TwitterFeed account.

Google Maps

1. Login into Google account.
2. Go to Google Maps http://maps.google.com/maps.
3. Type in the address of location used for media briefing or other pertinent locations. (Hit "Enter" to begin search.)
4. Click on the blue text of the address after it appears.
5. In the white pop-up box click "Save To My Maps."
6. Select "Create New Map."
7. Fill in "Title" (on left).
8. Add any other features that may be needed.
9. Click the "Save" button and "Done" button (on the left).
10. On the map (top right) click on the "Link" icon.
11. Copy HTML to embed in Website.
12. Paste HTML to Response site page "Media."

Appendix C: Information Exchange Matrices

Appendix C includes information exchange matrices for the following positions:

- Public Information Officer
- Fact Gathering Specialist
- Imagery Gathering Specialist
- Administrative Assistant
- Social Media Specialist

These matrices were developed to assist personnel with knowing what type of information, materials and/or resources they should obtain or provide to specific response positions within the JIC and ICS organization.

[This Page Intentionally Left Blank]

INFORMATION EXCHANGE MATRIX 1 – PUBLIC INFORMATION OFFICER

Leadership Position	When the PIO should talk to other positions	Information and Resources Exchange	
		PIO Provides	PIO Receives
Incident Commander/ Unified Command	• Initial incident briefing. • Command and General Staff, Objectives and Planning meetings. (See *Operational Planning "P"*, Appendix E). • Operations briefing. • Release of incident information (all information products, media events, etc.).	• Initial incident data. • Level of public interest. • Public information strategy. • Speaker preparation. • News releases, fact sheets, videos, photos, audio recordings, social media postings and news clips. • Interviews, news briefs and community meeting schedules. • Media analysis. • Social media analysis with source quote highlights.	• Appointment of PIO. • Initial incident brief. • Key messages. • News release authority. • Delegation of duties.
Safety Officer	• Initial incident briefing. • Command and General Staff, Objectives and Planning meetings. (See *Operational Planning "P"*, Appendix E). • Operations briefing. • Access for JIC personnel, media, community and distinguished visitors to incident site. • As needed.	• News releases, fact sheets, videos, photos, audio recordings, social media postings and news clips. • Roster of on-site visitors escorted by JIC personnel. • Escorts for media, community and distinguished visitors to incident site. • Media "hold harmless" release statement (cleared by legal counsel) for media traveling on government provided transportation.	• Safety briefings for JIC personnel, media, community and distinguished visitors. • Personal protective equipment when going on-site. • Incident response organization accident reports.
Liaison Officer	• Command and General Staff, Objectives and Planning meetings. (See *Operational Planning "P"*, Appendix E). • As needed.	• News releases, fact sheets, videos, photos, audio recordings, social media postings and news clips. • Names of additional agencies, organizations and stakeholders for inclusion in incident response.	• Names and numbers of additional agencies, organizations and stakeholders to be added to JIC dissemination list. • Pass-down of trends in stakeholder concerns.
Intelligence Officer	• Command and General Staff, Objectives, and Planning meetings. (See *Operational Planning "P"*, Appendix E). • As needed.	• News releases, fact sheets, videos, photos, audio recordings, social media postings and news clips. • De-briefing of JIC field personnel, as needed. • Facts gathered from outside the incident response organization, as needed.	• Intelligence briefings.

Leadership Position	When the PIO should talk to other positions	Information and Resources Exchange	
		PIO Provides	PIO Receives
Planning Section Chief	• Command and General Staff, Objectives and Planning meetings. (See *Operational Planning "P"*, Appendix E). • As needed.	• Copies of all news releases, fact sheets, videos, photos, audio recordings, social media postings and news clips for Documentation Unit. • Interview, news brief and community meeting schedule. • Public information guidance for inclusion in IAP. • Select information products for inclusion in IAP. • Demobilization paperwork for outgoing JIC personnel.	• Incident situation status data (SITL). • Daily meeting schedule. • Copy of IAP.
Operations Section Chief	• Command and General Staff, Objectives and Planning meetings. (See *Operational Planning "P"*, Appendix E). • As needed.	• News releases, fact sheets, videos, photos, audio recordings, social media postings and news clips. • Proposed schedule for JIC personnel conducting information gathering at field work locations or personnel escorting media to field	• Incident operations data.
Logistics Section Chief	• Command and General Staff, Objectives and Planning meetings. (See *Operational Planning "P"*, Appendix E). • As needed.	• News releases, fact sheets, videos, photos, audio recordings, social media postings and news clips. • Names of and a proposed schedule for people needing air/vessel transportation.	• Supplies and office equipment. • Adequate working space for JIC. • Contract assistance for newspaper, television and radio clipping service. • Specialized clothing. • Air/vessel transportation for JIC personnel and media to incident site(s).
Finance/ Administration Section Chief	• Command and General Staff, Objectives and Planning meetings. (See *Operational Planning "P"*, Appendix E). • As needed.	• News releases, fact sheets, videos, photos, audio recordings, social media postings and news clips.	• Travel orders.
Response Personnel	• Incoming personnel briefings, as needed. • Operations Briefing. • As needed.	• Speaker preparation. • News releases, fact sheets, videos, photos, audio recordings, social media postings and news clips.	• Spokespersons at media briefings, community meetings and individual interviews with media.
ESF #15 EAO or Deputy EAO	• When ESF #15 is activated. • Daily, as needed, based on needs of ICP Incident Action Plan for next operational period. • If ICP PIO receives request for interview that is beyond the scope of the FOSC/IC. • During the National Incident Communication Coordination Line (NICCL) calls.	• FOSC/IC field level command messaging for current and upcoming operational period. • FOSC/IC command concerns. • ICP JIC situation report. • ICP JIC media & community engagement plans for next operational period.	• Strategic, national level command messaging. • Support for media & community engagement requests that go beyond the scope of the FOSC/IC's responsibility. • ESF #15 media & community engagement plans.

INFORMATION EXCHANGE MATRIX 2 – FACT GATHERING SPECIALIST

Request Information From	Information to Request	✓
Public Information Officer	Request initial incident briefing. Request updated information following the Command and General Staff meetings.	☐
Assistant Public Information Officer for Media Relations	Request media inquiries to gather information to formulate answers. Gather information for developing responses to media inquiries.	☐
Assistant Public Information Officer for Community Relations	Request community inquiries. Gather information for developing responses to community inquiries.	☐
Assistant Public Information Officer for Information Gathering	Obtain work assignment(s). Provide updates.	☐
Logistics Section	Request information regarding equipment/personnel.	☐
Planning Section – Situation Unit	Request information from Situation Reports. Request plume modeling and spill trajectories.	☐
Planning Section – GIS	Request maps and charts.	☐
Planning Section – Environmental Unit	Request Material Safety Data Sheet (MSDS).	☐
Planning Section	Request a copy of the IAP. Request a copy of the daily meeting schedule.	☐
Operations Section	Request location and number of resources on-site from Staging. Request information about on-going operations.	☐
Finance Section	Request cost of response and claims hotline number.	☐
Response partners	Request other agency's participation and plans.	☐
Intelligence Officer	Request information cleared for public release by the IC/UC regarding law enforcement, terrorist or security issues.	☐
Liaison Officer	Request information about affected stakeholders.	☐
Safety Officer	Request safety concerns for responders and general public and appropriate protective actions.	☐

INFORMATION EXCHANGE MATRIX 3 – IMAGERY GATHERING SPECIALIST

APIO or ICS Section you receive assignments from	Materials and Resources Exchange	
	From APIO/ICS Section to Imagery Gathering Specialist	From Imagery Gathering Specialist to APIO/ICS Section
Assistant Public Information Officer for Information Products	• Imagery assignments.	• Briefing on activities.
Assistant Public Information Officer for Media Relations	• Not applicable.	• Edit photos, videos and audio recordings for release to the media.
Assistant Public Information Officer for Community Relations	• Not applicable.	• Edit photos, videos and audio recordings for release to the public and for use at community meetings.
Writer	• Photo assignments.	• Image support for fact sheets (as needed). • Briefing on activities.
Status Board Specialist	• Not applicable.	• Imagery for information boards.
Operations Section	• On-water/aerial transportation to sites.	• Not Applicable.
Logistics Section	• Supplies.	• Not Applicable.
Planning Section	• Daily schedule. (ICS Form 204.)	• Imagery for IAP.
Documentation Unit	• Not applicable.	• Copies of all photos, videos and audio recordings.

[This Page Intentionally Left Blank]

INFORMATION EXCHANGE MATRIX 4 – ADMINISTRATIVE ASSISTANT

Request items/information from:	Materials and Resources Exchange	
	From Response Position to Administrative Assistant	From Administrative Assistant to Response Position
Logistics Section	• Space, chairs, lectern, tables, PA system and other materials for media briefings. • Security service for the JIC. • JIC visitor passes.	• Not applicable.
Media Monitoring and Analysis Specialist	• Copies of news clips.	• Not applicable.
Writer	• Copies of news releases and fact sheets for briefing packs and media briefings. • Copies of key message(s), talking points and speaker prep sheets.	• Not applicable.
Imagery Gathering Specialist	• Photos, videos and audio recordings for media briefings. • All products that do not have an immediate use for inclusion in the casebook.	• Not applicable.
Assistant Public Information Officer for Media Relations	• Copies of media list.	• Not applicable.
Social Media Specialist	• Copies of archived social media content.	• Not applicable.
Documentation Unit	• Not applicable.	• Copies of all JIC files and products.

[This Page Intentionally Left Blank]

INFORMATION EXCHANGE MATRIX 5 – SOCIAL MEDIA SPECIALIST

APIO or ICS Section you receive assignments from	Materials and Resources Exchange	
	From APIO/ICS Section to Social Media Specialist	From Social Media Specialist to APIO/ICS Section
Public Information Officer	• Direction on site design.	• Not applicable.
JIC Manager	• Not applicable.	• Information of trending topics for the daily briefings.
Assistant Public Information Officer for Information Products	• News releases, fact sheets, media advisories, PSAs, photos, videos and audio recordings.	• Trending issues that could prompt information products. • Relevant social media postings.
Assistant Public Information Officer for Media Relations	• Talking points and media inquiry trends.	• Trending issues that could prompt responses to media.
Assistant Public Information Officer for Community Relations	• Rules of engagements for social media use. (See *Social Media in a Response Job Aid 9,* Appendix B).	• Trending issues that can be used during community engagements.
Writer	• Feature length content for social media sites.	• Trending issues that could prompt information products. • Relevant social media postings.
Status Board Specialist	• Not applicable.	• Trending topics.
Website Specialist	• Website design.	• Integrating social media sites with incident website.
Imagery Gathering Specialist	• Photos, videos and audio recordings.	• Not Applicable.
Rumor Control Specialist	• Validated information on rumors.	• Rumors.
Documentation Unit	• Not applicable.	• Copies of archived social media content.

[This Page Intentionally Left Blank]

Appendix D: Forms

Below is a list of sample ICS forms that JIC personnel should be familiar with.

Form	Description
ICS 214	Unit Log
ICS 204	Assignment List
ICS 209-CG	Incident Status Summary
ICS 213	General Message
ICS 213RR-CG	Resource Request Form

For a complete listing of FEMA ICS forms, visit:
http://training.fema.gov/EMIWeb/IS/ICSResource/ICSResCntr_Forms.htm

To download the USCG forms included in this Appendix, visit:
http://homeport.uscg.mil

Click on "Library" on the horizontal menu bar, then click on "Incident Command System ICS" in the left menu. Under the "Forms" heading, click on "Coast Guard ICS Forms (Individual)". You can download fill-in-the-blank Word .DOT templates or Adobe Acrobat .PDF versions.

Appendix E: References, Worksheets, and Samples

Reference/Worksheet/Sample	Description
Daily Checklist	This checklist is a helpful tool to assist the PIO complete daily activities.
Operational Planning "P"	The Operational Planning "P" is a guide to the process and steps involved in planning for an incident.
JIC Self-Assessment Survey	By filling out the JIC Self-Assessment Survey, the PIO and JIC Manager can use the information provided to staff JIC positions.
Daily Brief Worksheet	Information collected using the daily brief worksheet is provided during transition meetings.
Media Analysis Worksheet	This worksheet assists in assessing the content and accuracy of news media reports and assists in identifying trends and breaking issues.
Social Media Analysis Worksheet	This worksheet assists in assessing the content and accuracy of social media reports and assists in identifying trends and breaking issues.
Query Record	This tool assists in keeping records of any inquiries or rumors reported.
Risk Communication Strategies & Guidelines	This tool assists in development of messages early in the response and in working with LNO to identify stakeholders.
Writing Guidelines for News Releases	These are guidelines to assist in writing news releases.
Sample News Release	This is a sample of a news release.
Media Briefing/Community Meeting Worksheet	This worksheet assists in preparing for a media briefing or community meeting.
Speaker Preparation Worksheet	This worksheet assists in preparing information that will be delivered via a media briefing or community meeting.
Spokesperson Request Worksheet	This worksheet assists in requesting spokespersons for media briefings.
Media Briefing Worksheet	This worksheet provides general guidelines and provides a sample moderator script for media briefings.
Field Escort Equipment and Communications Checklist	This checklist assists in ensuring that the media visiting the incident site are properly equipped and informed.
Opening Statement for Community Relations Interviews	This worksheet assists in performing interviews in order to obtain community feedback and information needs.
Sample Media Advisory (Media Briefing)	This is a sample of a media advisory for a scheduled media briefing.
Sample Media Advisory (JIC Established)	This is a sample of a media advisory announcing that the JIC has been established.
Sample Public Service Announcement	This is a sample of a public service announcement.
Public Exhibit and Discussion Diagram – Poster Exhibits/Public Availability Session	This is an example of one of the types of community meetings that may be held.

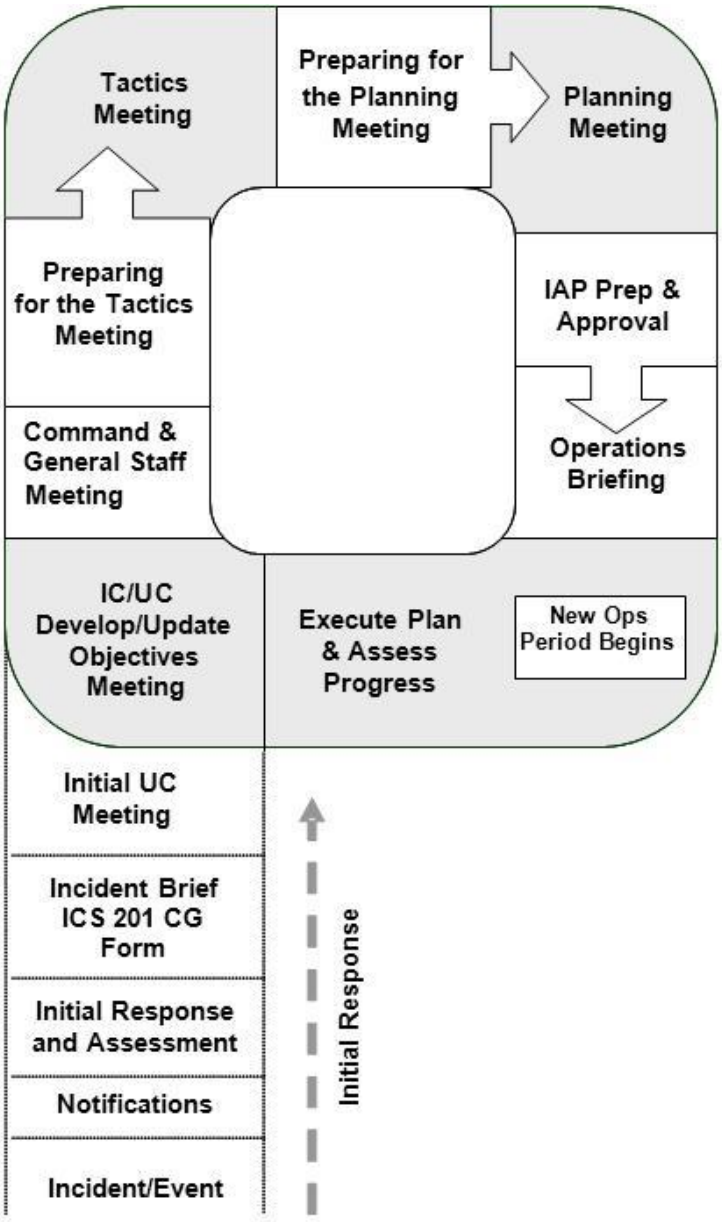
[This Page Intentionally Left Blank]

DAILY CHECKLIST

- [ ] Receive briefing from previous shift.
- [ ] Identify JIC priorities and tasks for oncoming shift.
- [ ] Develop and monitor information strategies in support of overall response effort.
- [ ] Monitor Joint Information Center's activities to ensure information strategies are being followed.
- [ ] Ensure public affairs people in field are given assignments.
- [ ] Ensure necessary work space, materials, equipment and personnel are available or requested.
- [ ] Receive approval from Incident Commander (IC)/Unified Command (UC) on all information released from the JIC.
- [ ] Maintain high level of understanding of current situation and response operations by attending Command and General Staff Briefings.
- [ ] Ensure Status Board Specialist works with the Situation Unit to obtain the most current information.
- [ ] Ensure information is being provided to internal and external stakeholders.
- [ ] Monitor any request identified by either the IC/UC of JIC as "special." VIPs, special interest, local issues, etc.
- [ ] Provide IC/UC with timely information about external perceptions, concerns and needs regarding the incident and response.
- [ ] Ensure the speakers for the media briefings are prepared by the JIC well before the conferences.
- [ ] Represent the IC/UC during all public functions where the actual members of the IC/UC are not in attendance.
- [ ] Ensure appropriate and timely communications are maintained by the JIC with government, community and media publics throughout the response.
- [ ] Ensure all work of the JIC is well documented and delivered to the appropriate places.
- [ ] Complete Daily Log (ICS-Form 214 or 214-CG).
- [ ] Brief incoming shift.

[This Page Intentionally Left Blank]

OPERATIONAL PLANNING "P"



- The Planning "P" is a guide to the process and steps involved in planning for an incident. The leg of the "P" describes the initial response period: Once the incident/event begins, the steps are Notifications, Initial Response & Assessment, Incident Briefing Using ICS 201 or ICS 201-CG, and Initial Incident Commander (IC)/Unified Command (UC) Meeting.
- At the top of the leg of the "P" is the beginning of the first operational planning period cycle. In this circular sequence, the steps are IC/UC Develop/Update Objectives Meeting, Command and General Staff Meeting, Preparing for the Tactics Meeting, Tactics Meeting, Preparing for the Planning Meeting, Planning Meeting, IAP Prep & Approval, and Operations Briefing.
- At this point a new operational period begins. The next step is Execute Plan & Assess Progress, after which the cycle begins again.

JIC STAFF SELF-ASSESSMENT SURVEY

Welcome to the JIC! Please complete this survey, so our PIO and JIC Manager can match your availability, experience, training, and preferences to the JIC Staff positions presently available.

First and Last Name: _____

Rank and/or Job Title: _____

Agency/Organization: _____

Work Phone: ( ) Cell Phone: ( )

E-mail address: _____

If you are staying at a hotel, list Hotel name: _____ Room #: _____

AVAILABILITY

Please list any dates/times or shifts that you are NOT available to work in the JIC:

_____

RESOURCES

Please check any equipment/supplies or other JIC resources that you brought with you:

☐ Laptop ☐ Printer ☐ Camera/videocam ☐ Tape recorder ☐ Office supplies

☐ Other: _____

EXPERIENCE

How many years of public affairs experience do you have? _____

How many times have you previously worked in a JIC? _____

Describe what JIC roles or duties you have previously performed:

_____

TRAINING

Please check which NIMS courses that you have completed:

☐ None ☐ IS-700 ☐ IS-702 ☐ IS-800 ☐ ICS-100 ☐ ICS-200 ☐ ICS-300 ☐ ICS-400

Have you completed any PIO or JIC training? ☐ No ☐ Yes _____

Have you completed any media spokesperson training? ☐ No ☐ Yes _____

SKILLS

Please check your "Top 3" best skills:

☐ Supervising others ☐ Developing strategies ☐ Conducting media briefings and interviews

☐ Gathering info ☐ Writing copy ☐ Taking photos/video ☐ Web support

☐ Answering inquiries ☐ Investigating rumors ☐ Computer skills ☐ Admin support

☐ Social media

☐ Other: _____

PREFERENCES

Please indicate which JIC role(s) or duties that you would like to be assigned to:

☐ Preferred role(s): _____

☐ No preference; I'll work any role or duties as needed

RISK COMMUNICATION STRATEGIES & GUIDELINES

Although some of the worksheets in this section specify risk communication during a health crisis, the worksheets are easily adaptable for any emergency situation.

Crisis & Emergency Risk Communication (CERC): Crisis Leader—First Message[5]

Build credibility with these 6 emergency message components:

1. Expression of empathy (e.g., understand you are hurt, confused, anxious, frightened):

_____
_____

2. Clarifying facts (Fill in only VERIFIED facts, skip if not certain):

Who_____

What (Action)_____

Where_____

When_____

Why_____

How_____

3. What we don't know:_____
4. Process to get answers:_____
5. Statement of commitment:_____

6. Referrals (If possible, skip if not yet ready**):**

For more information_____
Next scheduled update_____

Finally, check your message for the following:

Positive action steps	Avoid jargon
Honest/open tone	Avoid judgmental phrases
Say "we" not "I"	Avoid humor
Careful with early promises (can you do it?)	Avoid extreme speculation

Delivered: _____Time _____ Date

[5] Information from the Centers for Disease Control and Prevention, "*Crisis & Emergency Risk Communication*" *Workbook.*

CERC: First Response to Media Inquiries[6]

By phone to media:

- "We've just learned about the situation and are trying to get more complete information now. How can I reach you when I have more information?"
- "All our efforts are directed at bringing the situation under control, so
- I'm not going to speculate about the cause of the incident." How can I reach you when I have more information?"
- "I'm not the authority on this subject Let me have XXXX call you right back." "We're preparing a statement on that now. Can I fax it to you in about two hours?"
- "You may check our web site for background information and I will fax/e-mail you with the time of our next update."

At incident site or press availability:

Response to Inquiries (you are authorized to give out the following information)

Date: _____
Time: _____
Approved by: _____

This is an evolving emergency and I know that—just like we do—you want as much information as possible right now. I wish I could answer all of your questions here. While we work to get your questions answered as quickly as possible, I want to tell you what we can confirm right now:

- At approximately, _____ (time), a (brief description of what happened)

_____

- At this point, we do not know the number of _____ (persons ill, persons exposed, injuries, deaths, etc.).

- We have a system (plan, procedure, operation) in place for just such an emergency and we are being assisted by _____ (e.g., police, FBI, EOC) as part of that plan.

The situation is (under)(not yet under) control and we are working with (local, State, Federal) authorities to (e.g., contain this situation, determine how this happened, determine what actions may be needed by individuals and the community to prevent this from happening again).

We will continue to gather information and release it to you as soon as possible. I will be back to you within _____(amount of time, 2 hours or less) to give you an update. As soon as we have more confirmed information, it will be provided. We ask for your patience as we respond to this emergency. **For more information:**

_____
_____

[6] Information from the Centers for Disease Control and Prevention, "*Crisis & Emergency Risk Communication*" *Workbook.*

CERC: Leader Pre-event Checklist[7]

The following are keys to successful crisis communication. Discuss these with your communication director.

We know:

- ☐ Public information and media response is perceived by us as critical to our operational success
- ☐ Spokespersons (by topic) are identified and trained (e.g., empathy, honesty, commitment)
- ☐ Crisis Communication plan is integrated into overall operational plan
- ☐ A written procedure and agreement on clearance procedures is in place
- ☐ These clearance procedures take 15 minutes or less to accomplish
- ☐ These clearance procedures ensure accurate information is released
- ☐ These clearance procedures have been tested in drills/exercises
- ☐ These clearance procedures allow for authority delegation to speed response
- ☐ Contact information (including after hours) for primary media is handy to all who need it
- ☐ Adequate manpower and equipment is set aside to keep a 24-hour media operation going for up to 10 days
- ☐ Our information telephone number (hotline) for public inquiries is ready with trained operators
- ☐ Our response partners are identified and know our communication role and expectations
- ☐ Our stakeholders are identified and know how we will respond directly to them
- ☐ We have the capability of holding a national press conference if needed
- ☐ We can monitor media reports and public inquiries for rumors and respond to rumors in real time
- ☐ Strategic National Stockpile communication tools are in place
- ☐ Our emergency response plan notifies the communication director in first wave of calls/pages
- ☐ As an important stakeholder, we know our elected officials will want to communicate to constituents about this crisis and we have a plan to ensure a consistent message is delivered to the public
- ☐ Our Internet site can post media and public information materials within 45 minutes of final clearance
- ☐ We have an accountability plan to public/media about resource allocations during and after the crisis such as a web page that shows where disaster response funds are going that is updated routinely
- ☐ We can conduct a meaningful community hall meeting during crisis recovery
- ☐ All potential incident command or department leaders are fully trained in Crisis and Emergency Risk Communication and understand their role as a spokesperson

Guide for planning
health risk communication
(long version)[8]

Personnel's plan
Situation and place _____ Date _____

Determine the risk communication responsibilities in your team

Name, division, branch, phone, fax, e-mail	**Responsibilities**
1. _____	_____
2. _____	_____
3. _____	_____
4. _____	_____
5. _____	_____

Other members of your institution

Press office

Community relations

Team members from regional offices, state offices

Name, phone, fax, e-mail

_____
_____
_____
_____
_____
_____

Team members from other institutions (health sector, environmental sector)

Name, phone, fax, e-mail

_____
_____
_____
_____
_____
_____

[8] Information from the Centers for Disease Control and Prevention, "*Crisis & Emergency Risk Communication*" *Workbook*.

Schedule of activities

Plan the duration of your activities for health risk communication. Complete the activities on time, to achieve the highest impact. Set deadlines.

Activity	Person responsible	Deadline	Done (√)

Objectives of the health risk communication

Situation and place _____Date_____

This is one of the most important parts of your plan and one that is most often missed out. Set specific measurable objectives for the risk communication task, but not for the overall program.

Considerations

Why carry out risk communication activities in this situation and place?

_____
_____
_____

What ***knowledge*** of the community members do you want to affect?

_____
_____
_____

What ***attitudes*** of the community members do you want to affect?

_____
_____
_____

What ***behavior*** of the community members do you want to affect?

_____
_____
_____

Communication objectives

1. _____
_____

2. _____
_____

3. _____
_____

4. _____
_____

5. _____
_____

How will you determine whether the objectives have been met? (Are the objectives clear, measurable, and time-specific?)

1. _____
_____

2. _____
_____

3. _____
_____

4. _____
_____

5. _____
_____

Overview of the situation and place

Situation and place _____Date _____

Summarize your knowledge of the situation and place, including a synopsis of the history, summary of work done, and unique circumstances pertaining to the work carried out by your institution.

Type of situation

_____
_____
_____

Public health situation

Contaminants of interest detected_____
_____

Environment with potential or declared contamination

____ air
____ soil
____ water
____ sediments
____ biological (fish/fauna)

Do some people use water from a well? ____ Yes ____ No

Potential health impacts_____
_____

Suspected or documented health impacts_____
_____

Complete routes of exposure_____
_____

Potential routes of exposure _____
_____

Known incidents of exposure_____
_____

History of the situation and place

Include a map of the place and the relationship with residents, schools, parks, water sources, etc.

Use formerly given to this place_____
_____

Owner of the place_____
_____

Type of jobs in this place _____
_____

Type of government institution involved_____
_____

Critical decisions and significant actions_____

Key dates in the future_____
_____

Government structure

Type of local government_____
_____

Key political positions_____
_____

Previous community interaction with government institutions_____
_____

Description of the community

Geographic limits _____
_____

Total density of population_____
_____

Population living in neighboring areas _____
_____

Distribution of residents per age group_____
_____

Level of education _____
_____

Ethnic structure _____
_____

Languages / dialects spoken _____
_____

Socioeconomic level _____
_____

Religious groups _____
_____

Interests _____
_____

Characteristics

____ Immediate neighborhood
____ Schools / day-care centers
____ Community buildings (churches)
____ Office buildings / work premises
____ Parks and recreation areas
____ Areas for protection of natural resources
____ Health-care services
____ Industry in the area
____ Other potential sources of contamination

Concerns of the community

Health concerns_____
_____

Environmental concerns_____
_____

Economic concerns_____
_____

Legal concerns_____
_____

Unmet needs for information, education, or training _____
_____

Perceived lack of response to their concerns _____
_____

What does the community know about the situation and the place?
_____

What gaps are there in the knowledge of the community members?
_____

What does the community want to know?
_____

What attitudes or beliefs of the community members can ***negatively*** affect the incorporation of preventive actions or community cooperation? _____
_____
_____

What attitudes or beliefs of the community members can ***positively*** affect the incorporation of preventive actions or community cooperation?_____
_____
_____

What do the community members do that puts them at risk? _____
_____
_____

What can the community members do to protect themselves from the hazards associated with the situation and the place?_____
_____
_____
_____

Community organization and contacts

Environment_____
_____

Business_____
_____

Social_____
_____

Religious_____
_____

Community leaders

Elected _____
_____

Not elected_____
_____

Publicity on the situation and the place

News coverage _____
_____

Visibility of the situation and the place_____
_____

Planning tool for making a list of the media

Situation and place _____Date _____

Determine which media cover the situation and the place. Review coverage given to them in the past.

Media	Contacts	Past coverage
Newspapers		
Radio stations		
Television channels		
Other media		

Planning tool for designing messages

Situation and place _____Date _____

Your messages must be well grounded to communicate accurate and consistent information

Questions asked by the community

Are we safe? _____
_____
_____

What have you found that can affect us? _____
_____
_____

What is the source of the problem?_____
_____
_____

Does this contaminant cause health problems? (specify)_____
_____
_____

Can you correct it? Who can correct it? _____
_____
_____

Considerations

How do you define health risk? _____
_____
_____

What inconsistencies are there in the messages to the community from different sources? How are we going to clarify them?_____
_____
_____

What doubts or concerns do members of the community have? How are we going to clarify them?_____
_____
_____

What other communicators are working in the community? What messages have they transmitted?
_____
_____
_____

Key Messages

1._____
_____
_____
Supporting information or evidence_____
_____
_____

2._____
_____
_____
Supporting information or evidence_____
_____
_____

3._____
_____
_____
Supporting information or evidence_____
_____
_____

Planning tool for community interaction

Situation and place _____Date _____

Define the community and the audience for the health risk communication activities.

Consider:
Individuals and groups who facilitate action_____
_____

Individuals and groups who have been involved previously in this matter_____
_____

Individuals and groups who are interested in participating _____
_____

Individuals and groups who can be affected or who perceived themselves to be affected_____
_____

Individuals and groups who may feel relegated or annoyed if they are not included_____
_____

Segment of the audience	Key contact	Specific concerns and issues
Government personnel		
Elected authorities		
Local government personnel		
Citizen groups		

Segment of the audience	Key contact	Specific concerns and matters
Local residents		
Local health professionals		
Representatives of local businesses		
Civic groups		
Groups of public interest		
Principals of local schools		
Potentially responsible parties		
Other federal institutions		
Other personnel from your institution		
Others		
Others		

Sub-group	Key contact	Specific concerns and issues
What other language or dialect do they speak?		
Sociocultural situations		
Activists		
Workers and their families		
Other groups with special characteristics		

Tool for planning strategies and techniques of health risk communication

Situation and place _____Date _____

Design a specific plan for health risk communication activities. Strategies are things you plan to do, and techniques are how you are going to do them. For example, "Explain the type of work your institution does" is a Strategy, in which one of your Techniques may be to "Distribute fact sheets about the institution."

Strategies and Techniques:

Strategy: Introduce your organization to the community.
Technique
1._____
_____
2._____
_____
3._____
_____
4._____
_____
5._____
_____

Strategy: Involve the community in the risk communication.
Technique
1._____
_____
2._____
_____
3._____
_____
4._____
_____
5._____
_____

Strategy: Work effectively and include the community leaders and other work partners.
Technique
1._____
_____
2._____
_____
3._____
_____
4._____
_____
5._____
_____

Strategy: Communicate early and regularly with the community.
Technique
1._____
_____
2._____
_____
3._____
_____
4._____
_____
5._____
_____

Strategy: Use the news media to transmit accurate information.
Technique
1._____
_____
2._____
_____
3._____
_____
4._____
_____
5._____
_____

Strategy: Be ready to face a crisis.
Technique
1._____
_____
2._____
_____
3._____
_____
4._____
_____
5._____
_____

Strategy: Be in contact with the community after carrying out the main activity, if applicable.
Technique
1._____
_____
2._____
_____
3._____
_____
4._____
_____
5._____
_____

Tool for planning the evaluation of the health risk communication

Situation and place _____Date _____

Formulate your plan to give follow-up to your work in accordance with your original objectives. Review this section periodically to write notes on the program, suggestions for future work, and comments. Once you have finished your field activities, this section completes your plan and provides you with a complete file on the field work.

Base line information that will enable comparisons to be made (for example: prevalence of activities or beliefs that you hope to modify or eradicate).

_____
_____
_____

Planning of the evaluation (formative) to test your messages and materials

What are you evaluating? _____
_____
_____

How are you going to evaluate it? _____
_____
_____

What were the results? _____
_____
_____

Evaluation of the immediate impact: review and document the activities carried out

What are you evaluating? _____
_____
_____

How are you going to evaluate it? _____
_____
_____

What were the results? _____
_____
_____

Evaluation (of products) at an intermediate point to determine whether the short-term objectives were met

What are you evaluating? _____
_____
_____

How are you going to evaluate it? _____
_____
_____

What were the results? _____
_____
_____

Evaluation of results (impact) to determine whether the long-term impacts were achieved

What are you evaluating? _____
_____
_____

How are you going to evaluate it? _____
_____
_____

What were the results? _____
_____
_____

WRITING GUIDELINES FOR NEWS RELEASES

1. Assemble the facts into two or three sentences that answer – who, what, when, where, why and how.

2. List the remaining facts in descending order of importance (i.e., the Inverted Pyramid journalism style) in narrative or, if necessary, bullet form (e.g., what agencies are responding, type and amount of equipment). **NOTE:** The release should be only one page in length. If there is a need for additional information about specific topics, then a separate fact sheet should be created. Follow steps 3 - 5 for fact sheets and news releases.

3. Spell check and edit the release and give it to the APIO for Information Products and the PIO for review and approval by IC/UC. (Review by subject matter specialists, technical experts and/or legal counsel may be helpful prior to approval by IC/UC.)

4. Give copies of approved release to all JIC staff members or posting on Status Boards, inclusion in JIC Case Book and to respond to media and community inquiries.

5. Email, fax or disseminate to media and other internal/external stakeholders.

UNIFIED COMMAND RESPONDS TO (INCIDENT)

(**CITY, State -**) Write one sentence for the LEAD paragraph being as brief as possible. Include the most important information in this first sentence such as what happened, where, to who and when.

The BRIDGE paragraph is next and covers more detailed information than the lead. The release should be written in inverted pyramid style. *Inverted pyramid means that you start with the most important information at the beginning of the release and the least important goes at the end.* Why and how are mentioned here (if available) as well as secondary facts and identification (lead paragraphs do not contain names of individuals.)

The BODY section covers the remaining relevant information. Stick to the facts. Use active, not passive, voice. *(e.g. Rather than writing "entered into a partnership" use "partnered" instead.)* Use only enough words to tell your story. Beware of jargon. Avoid the hype. (*The exclamation point (!) is your enemy.)* Always have someone proof read your release and be prepared for changes.

###
(this signifies the end of the release)

MEDIA BRIEFING WORKSHEET

General Guidelines:
As the moderator it is your responsibility to set the tone for the media briefing.

Have a predetermined message for each media briefing. If you do not have a message, you do not need a media briefing.

Provide correct spellings for any of the names with peculiar spellings. Ensure you state the person's position in the Unified Command.

Determine proper local pronunciations. (For example, Biloxi is pronounced Beh-lux-ee not Beh-lox-ee).

Set a time with your speakers prior to starting the media briefing. Stick to that time. Do not let any one person dominate the time during the media briefing. Take charge and use time as your authority.

Make yourself available at the end of the media briefing. This will build relationships and your trust and credibility with the members of the media attending your media briefing.

Moderator Script:
Welcome, Ladies and Gentlemen to today's (this morning's, tonight's) MEDIA BRIEFING.

We will be presenting information on _____ today.

With us today is _____.

We will begin today with some brief statements from the representatives of the Unified Command. Then we will open the floor to your questions. Because of on-going operations we will be available for _____ minutes today. Please allow time for everyone here to ask questions.

Following the media briefing, the Joint Information Center Staff and myself will be available to help you with any further needs.

OPENING STATEMENT FOR COMMUNITY RELATIONS INTERVIEWS

Example for Intercept Interview

Hello, my name is _____, and I'm from the Joint Information Center that is helping with the response to the incident (describe).

Do you live or work in this area?

We are asking a few community members to give us feedback on the incident.

We want to make sure we are getting you and all community members the information you want and need.

The questions will only take a few minutes to answer.

I can assure you that your answers will be kept in confidence.

First, let me ask…

Example for Telephone Interview

Hello, my name is _____, and I'm calling from the Joint Information Center that is helping with the response to the incident *(describ*e).

Is this (state telephone number)?

We are asking a few community members to give us feedback on the incident.

We want to make sure we are getting you and all community members the information you want and need.

The questions will only take a few minutes to answer.

I can assure you that your answers will be kept in confidence.

First, let me ask….

Executive Summary

The revisions in the 2021 guidelines focus on maintaining the integrity of the program, and provide minor technical amendments to the guidelines. The largest changes to the guidelines provide policy clarifications on Temporary Storage capacity calculations, and to clarify the requirements for nonfloating oil classification equipment requirements.

Throughout the recent challenging and dynamic operational environment, response professionals across the country have demonstrated resilience and dedication to their craft, pioneering new strategies and innovations in communication and remote presence while maintaining exceptional performance standards.

Real-world incidents have shown that this program directly contributes rapid and well-coordinated responses. The OSRO classification does not guarantee performance, nor does the use of a Coast Guard-classified OSRO relieve plan holders of their responsibility to ensure the adequacy of response resources. **Plan holders must ensure their contracted OSRO, regardless of classification, is able to meet their planning requirements.** Plan holders must continue to conduct a plan-by-plan and vessel-by-vessel review of identified resources provided by their OSROs to validate that the resources available under the contract are sufficient to meet their planning requirements, even if an OSRO has a given classification for a specific operational area.

Although participation in the OSRO classification is voluntary, it is critical that participating OSROs ensure their resources are accurately reflected in the Response Resource Inventory (RRI) at all times. The success of the program relies on the real-time capture of OSRO capabilities at their specified OSRO sites, which determines the classifications that plan holders cite in their response plans. The Coast Guard is actively working to modernize and improve data entry within the RRI to ease the administrative burden on participating OSROs and to ensure that it meets the highest standards of cyber security requirements mandated by the federal government and our DoD partners.

As we continue to refine the connectivity between response and preparedness, stay tuned for future efforts to better connect these guidelines with our Preparedness Assessment Visits, Government-Initiated Unannounced Exercises, Area Contingency Plans, exercises, real-world events and RRI status—all in an effort to support the highest level of preparedness. We encourage all OSROs to provide input and lessons learned to CG-MER through their professional organizations and direct feedback to CG-MER and the NSFCC.

Thank you for all your continued commitment to oil spill response excellence and to the protection of the environment. While no one desires an incident, it is heartening to be able to rely on the expertise and professionalism of the oil spill response community.

Semper Paratus! Always Ready!

CHAPTER 1. Classification Process and Requirements

A. OSRO Guidelines: A Brief History

1. Section 311(j) of the Federal Water Pollution Control Act (FWPCA), amended by section 4202 of the Oil Pollution Act of 1990 (OPA 90), requires the preparation and submission of response plans by the owners or operators of certain oil-handling facilities and for all vessels defined as "tank and non-tank vessels" (hereafter referred to as plan holders). Plan holders, through their response plans, must address the extremely complex system for assembling, mobilizing, and controlling response resources to maintain statutory compliance as well as being prepared to respond to oil spills within their area of operation. Plan holders are required to submit a response plan to the Coast Guard that identifies and ensures, by contract or other approved means, the availability of response resources (personnel and equipment) necessary to remove, to the maximum extent practicable, a worst case discharge (WCD), including a discharge resulting from fire or explosion, and to mitigate or prevent a substantial threat of such a discharge.
2. To relieve the burden upon the plan holders to provide extensive detailed lists of response resources, the Coast Guard created the Oil Spill Removal Organization (OSRO) classification program, administered by the National Strike Force Coordination Center (NSFCC), so that plan holders would be required to identify the OSROs only by name in their response plans, if the OSRO meets a plan holder's planning requirements. If the OSRO is classified by the Coast Guard, then its capacity has been determined to equal or exceed the response capability caps needed by a facility, tank vessel and non-tank vessel plan holders. In addition, OSROs voluntarily participating in the classification program must maintain detailed lists of response resources in the Response Resource Inventory (RRI), which is administered by the NSFCC.
3. The RRI is the backbone of the classification system and its capabilities are two-fold: an inventory element and a classification element. The inventory element provides Federal On-Scene Coordinators (FOSCs) and contingency planners the ability to query available spill response equipment and its proximity to Coast Guard Captain of the Port (COTP) zones. The classification element, largely considered an incentive for OSROs to enter their inventories into the RRI, complements Facility Response Plan (FRP) and Vessel Response Plan (VRP) development and review processes by systematically classifying OSRO response capability up to the response capability caps.
4. Historically, the Coast Guard based OSRO classification levels upon three categories: (1) feet of containment boom; (2) temporary storage capacity (TSC); and (3) skimmer capacity, which translated into an estimated daily recovery capacity (EDRC) measured in barrels per 24-hour period. In December 1995, the guidelines added classification based upon COTPs zones and specific operating environments.
5. In June 2002, the Coast Guard modified the guidelines to include classifying OSROs in six operating areas versus four, eliminating Average Most Probable Discharge (AMPD) classifications, and incorporating Maximum Most Probable Discharge (MMPD) through WCD Tier 3. In addition, the guidelines introduced Alternate Classification Cities (ACCs) within COTP

zones to stimulate increases in classified OSRO coverage. Further, the guidelines added time delivery parameters to calculate response times based on whether or not companies had personnel on-site 24 hours a day, capable of mobilizing and deploying equipment upon notification, and whether or not the equipment being used was owned, contracted, or obtained for company use by other approved means.

6. In 2019, the Coast Guard modified the guidelines to bring them into compliance with regulatory requirements and to eliminate exceptions and waivers which were not permissible under the existing statutes/regulations. The guidelines clarified that the alternative compliance program consistent with 33 CFR §§ 154-155 continued to remain a part of the guidelines.

7. In a collaborative process with the maritime response industry, BSEE has introduced a set of response system planning calculators which provide the Estimated Recovery System Potential (ERSP) of the response plan. The Coast Guard recognizes the value of these calculators as a planning tool, and is actively working to develop near-shore and coastal ERSP calculators to assist planholders in identifying and meeting their planning goals. Existing regulations within 33 CFR §§154, 155 mandate the use of Effective Daily Recovery Capacity (EDRC) to evaluate response equipment, and these guidelines continue to use EDRC as a key performance metric. Although not required for classification, the Coast Guard encourages OSRO and planholders to evaluate their plan performance through multiple methods; including ERSP (where applicable).

B. Significant Revisions to the OSRO Guidelines

1. The most significant revision in this edition clarifies the intent of the contracted Temporary Storage Capacity calculations, located in Chapter 3.F.2. Like dedicated storage, non-dedicated temporary storage may only be counted towards the classification requirements when it is available to meet response time requirements. Therefore, non-dedicated storage must be regularly operated within the COTP zone or ACC in order to meet the requirements of 3.F.2.

2. These guidelines also add a clarification in Chapter 6 covering Nonfloating Oil OSRO applications. Applicants for a Nonfloating Oil classification must maintain an equipment inventory sufficient to perform services across the full range of the operating area and operating zone sought. Classifications will not be given for partial capabilities (e.g., response capabilities only for shallow water areas <6ft). OSROs must demonstrate the capability to respond to all areas and conditions where nonfloating oil response operations may take place within that zone, and must provide an equipment inventory which demonstrates the capability to work in a variety of water depths, conditions, and bottom types.

C. Application Process

1. Any OSRO may voluntarily apply for classification by contacting the NSFCC. Participation in the OSRO classification program is voluntary; however, once an OSRO chooses to participate in the classification program, full compliance is mandatory in order to maintain the classification.

2. The RRI website can be found at the following link: https://cgrri.uscg.mil/logon.aspx?ReturnUrl=%2fdefault.aspx.

3. OSROs should review the guidelines prior to applying as each classification program has specific requirements. Guidance regarding this program may be obtained from:

   Commanding Officer
   National Strike Force Coordination Center
   ATTN: Response Resource Assessment Branch
   1461 North Road Street, Elizabeth City, NC 27909-3241
   Tel: (252) 331-6000 / Fax: (252) 331-6012
   Email: D05-SMB-NSFCC-RRI@uscg.mil
   http://www.uscg.mil/hq/nsfweb/nsf/nsfcc/ops/ResponseSupport/RRAB/rrab.asp

4. NSFCC assigns classification based on the information supplied by each OSRO. Participation in the RRI is mandatory for an OSRO to receive classification. For an application to be accepted, an OSRO must complete all pertinent RRI data fields.

5. For a majority of the classification programs, the NSFCC utilizes the response times, discharge quantities, and equipment requirements specified in the FRP and VRP regulations and in these guidelines to determine the appropriate classification(s) for each COTP zone or ACC requested by an OSRO. For all classifications, OSROs requesting new classification should complete the initial registration and equipment entry into the RRI and provide the NSFCC with a complete response equipment inventory list. For the nonfloating oil classification, OSROs should complete the application outlined in Chapter 6 and, upon approval from the NSFCC, enter their nonfloating response equipment inventory list into RRI.

6. Following the classification assessment by the NSFCC, the NSFCC will schedule an initial Preparedness Assessment Visit (PAV) with the applicant. The NSFCC will coordinate with the appropriate COTP and District Response Advisory Team (DRAT) to schedule the PAV.

7. An OSRO may withdraw from the participating in the classification program at any time with written notice to the NSFCC. However, in order to return to the program, the OSRO will be reevaluated through the full application process

8. The following figures depict the evaluation and review process for becoming a classified OSRO. The timelines depicted below do not begin until the NSFCC receives all necessary documentation.

Figure 1-1: OSRO Classification Review Process

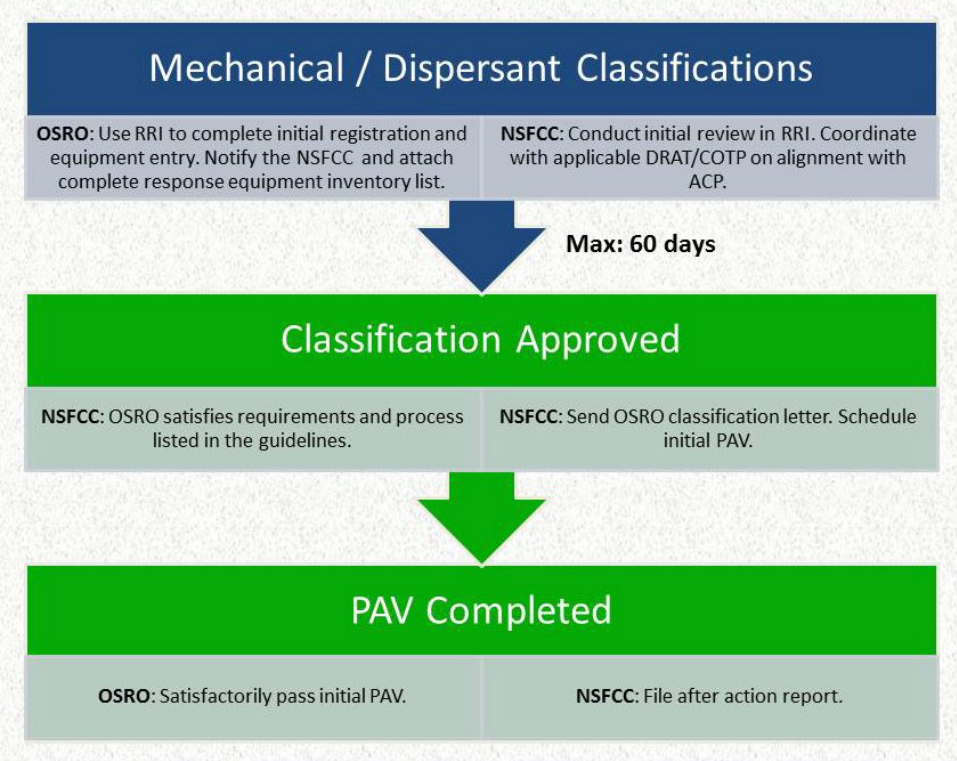

Figure 1-2: OSRO Nonfloating Oil Classification Review Process

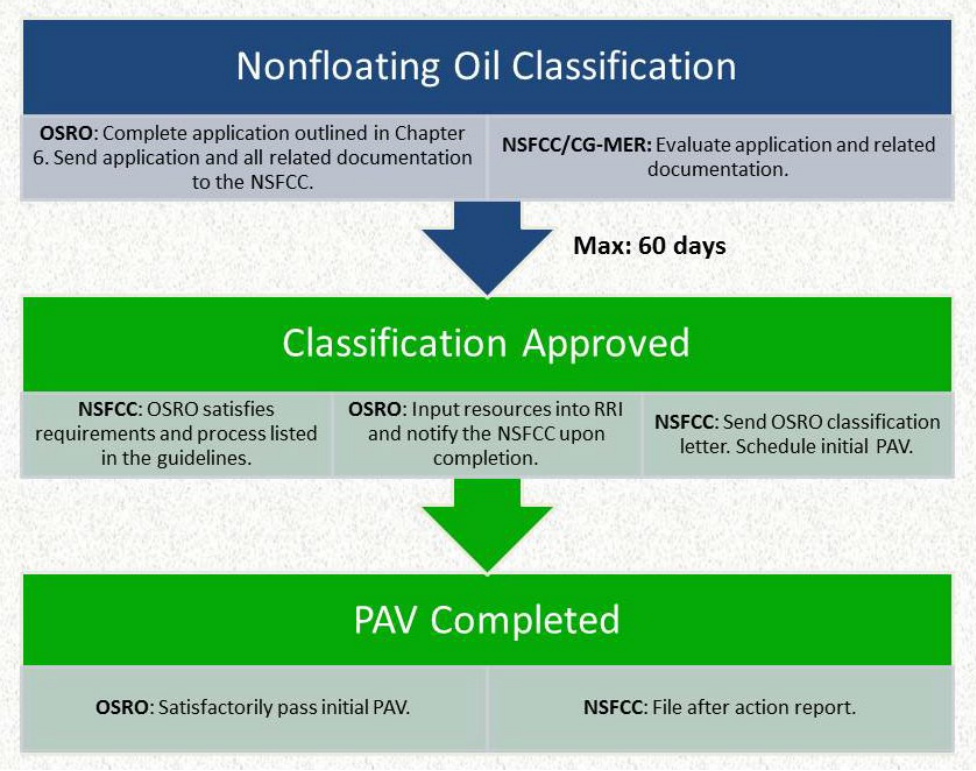

D. Alternative Compliance

1. **Alternative Compliance Background:** Previously, an OSRO was able to submit for an optional acceptable classification for EDRC, travel speed, TSC, and boom. However based on a regulatory review, the optional acceptable classification program ended. In its place, OSROs may apply for an alternative compliance if an OSRO feels that one or more of the alternative calculations allowed by regulations are applicable and necessary. OSROs shall also document if their alternative compliance request relates to an approved or pending alternative planning criteria. OSROs shall submit requests electronically or in writing to the NSFCC. OSROs or plan holders seeking alternatives for categories other than what is in Table 1-1 should use the Alternative Planning Criteria process.

Table 1-1: Acceptable Alternative Compliance and Regulatory Citations

Category	Response Plan Regulations	
	Facility	Vessels
	33 CFR § 154	33 CFR § 155
EDRC	Appendix C, Section 6.3	Appendix B, Section 6.3
Travel Speed	Appendix C, Section 2.6	Appendix B, Section 2.6
TSC	Appendix C, Section 9.2	Appendix B, Section 9.2

2. **Alternative Compliance Procedures:**

   a. Any approved alternative compliance will be valid for a maximum of three years. Six months prior to expiring, the NSFCC will notify the OSRO either to reapply for the alternative compliance or to update their resources in RRI to reflect that the alternative compliance is no longer necessary.

   b. After the OSRO has sent the alternative compliance request to the NSFCC either by mail or electronically, the NSFCC will solicit input from the applicable COTP, District, Area, and Coast Guard Office of Marine Environmental Response Policy (CG-MER) prior to making an approval decision within 60 days of receiving all required documentation.

3. **Estimated Daily Recovery Capacity (EDRC):**

   a. 33 CFR § 154 Appendix C and 33 CFR § 155 Appendix B allow OSROs to submit an alternative compliance for EDRC on behalf of plan holders via the instructions in the regulations cited in Table 1-1 of these guidelines.

   b. OSROs or plan holders submitting these requests must provide the appropriate documentation requested in the regulations; including the specific tests utilized and the results for the specific class of equipment requested, or provide verified performance data from real-world operations.

4. **Vessel Speeds**: For classification purposes, the regulation calculates vessel speeds using the planning speed criteria of 5 knots (kts). The speed of five kts is a conservative planning criterion which is specified in 33 CFR § 154 and § 155 and takes into account mobilization time and environmental factors. However, OSROs that demonstrate that a vessel can consistently and safely perform at speeds greater than five kts may request their classification(s) be determined using an alternative transit speed. Alternative speeds are most likely to apply to large vessels such as Oil Spill Response Vessels (OSRVs), tugboats, and barges.
    a. OSROs who wish to use alternative transit speeds for water transit shall submit their alternative compliance requests electronically or in writing to the NSFCC. The requests should specify the individual vessel(s) the alternative speeds will apply to and must, at a minimum, include the following documentation:
        (1) Logs and records indicating vessel speed over various routes;
        (2) Charts indicating routes and distance transited; and
        (3) Mobilization plan (including personnel recall numbers).
    b. Upon concurrence, the NSFCC will factor in the alternative speeds when determining the OSRO's classification for the applicable vessels. If the OSRO has already received a classification, the information will be used to revise that classification.
5. **Vehicle Speed**: No request for alternative over-the-road speeds will be accepted. The set planning standard for over-the-road vehicles is 35 mph. The NSFCC sets this speed based on external factors such as average speed limits and traffic, so actual mechanical ability does not increase the planning standard.
6. **Aircraft Speed:** For classification purposes, the regulation calculates aircraft using the planning speed of 100 kts. If OSROs demonstrate an aircraft can perform at speeds greater than 100 kts safely, they can request an alternative compliance for transit speed.
    a. OSROs that wish to use alternative transit speeds for air transit shall submit their requests electronically or in writing to the NSFCC. The requests should specify:
        (1) Logs and records indicating aircraft speed over various routes;
        (2) Confirmation that they have reviewed and are abiding by all applicable Federal Aviation Administration (FAA), state and local regulations and policies; and
        (3) Charts indicating routes and distance transited.
    b. Upon concurrence, the NSFCC will factor in the alternative speeds when determining the OSRO's classification for the applicable aircraft and COTP zones. If the OSRO has already received a classification, NSFCC will use the information to revise the classification.
7. **Temporary Storage Capacity**: 33 CFR § 154 Appendix C and 33 CFR § 155 Appendix B allow OSROs to submit an alternative compliance for TSC on behalf of plan holders via the instructions in the regulations cited in Table 1-1 of these guidelines.

E. Alternate Classification Cities Program

1. Traditionally, OSRO capability has been measured from COTP zones identified in 33 CFR §

3.05-10 through 33 CFR § 3.85-15. Recognizing that commercial operation often occurs in ports other than the COTP zones, the Coast Guard has identified ACCs. ACCs are Coast Guard designated locations used in addition to the zone in which the COTP is located for classifying OSROs. ACCs help to alleviate the concern that, in larger COTP zones, a spill could occur at a greater distance from the COTP zone to which an OSRO could not respond within the regulatory timeframes. However, regulation requires the plan holder to calculate response times using the location the vessel operates farthest from the storage location of the OSROs response equipment. This may not be the COTP city or the ACC. It may be an area offshore.

2. The following ACCs are geographic locations within the United States that have been designated to fill coverage gaps between COTP zones:
   a. Cape Fear River, NC; COTP North Carolina
   b. Huntington, WV; COTP Ohio Valley
   c. Paducah, KY; COTP Ohio Valley
   d. Panama City, FL; COTP Mobile
   e. Port Canaveral, FL; COTP Jacksonville
   f. Toledo, OH; COTP Detroit
   g. Cleveland, OH; COTP Buffalo
   h. Oswego, NY; COTP Buffalo
   i. Marquette, Ml; COTP Sault Ste. Marie
   j. Traverse City, MI; COTP Sault Ste. Marie
   k. Alpena, MI; COTP; Sault Ste. Marie
   l. Chicago, IL; COTP Lake Michigan
   m. Eureka, CA; COTP San Francisco
   n. Morro Bay, CA; COTP Los Angeles/Long Beach
   o. Cape Flattery, WA; COTP Puget Sound
   p. Coos Bay, OR; COTP Columbia River
   q. Portland, OR; COTP Columbia River
   r. American Samoa; COTP Honolulu
   s. Adak, AK; COTP Western Alaska
   t. Kodiak, AK; COTP Western Alaska
   u. Prudhoe Bay, AK; COTP Western Alaska
   v. Nome, AK; COTP Western Alaska
   w. Unalaska, AK; COTP Western Alaska

x. Ketchikan, AK; COTP Southeast Alaska
y. Sitka, AK; COTP Southeast Alaska
z. Yakutat, AK; COTP Southeast Alaska
aa. Aberdeen, SD; Inland ACC
bb. Denver, CO; Inland ACC
cc. Gallup, NM; Inland ACC
dd. Lincoln, NE; Inland ACC
ee. Lubbock, TX; Inland ACC
ff. Miles City, MT; Inland ACC
gg. Missoula, MT; Inland ACC
hh. Oklahoma City, OK; Inland ACC
ii. Salt Lake City, UT; Inland ACC
jj. Saipan; COTP Guam
kk. Lewes – Lower Delaware Bay; COTP Delaware Bay
ll. Akutan; COTP Western Alaska
mm. Sand Point; COTP Western Alaska
nn. Atka-Nazan Bay; COTP Western Alaska
oo. Shemya Island – Alcan Harbor; COTP Western Alaska
pp. Buldir Pass; COTP Western Alaska
qq. Amchitka Pass; COTP Western Alaska
rr. Sanak Island; COTP Western Alaska
ss. Attu Transit Zone; COTP Western Alaska
tt. Amukta Pass; COTP Western Alaska
uu. King Cove; COTP Western Alaska
vv. Attu Island; COTP Western Alaska
ww. St. Thomas; COTP San Juan
xx. St. Croix; COTP San Juan

3. OSROs wishing to provide services for plan holders in areas where it may be appropriate to determine classification using an ACC should send all requests for ACC designations to the NSFCC. The NSFCC consults with the applicable COTP and CG-MER as they review requests and establish new ACCs.

F. OSRO Exercises

1. Both the FRP and VRP regulations require plan holders to conduct annual equipment deployment exercises involving the OSROs listed in their response plans pursuant to 33 CFR § 154.1055 and 33 CFR § 155.1060. An OSRO who is listed as the primary response organization in a response plan and wishes to obtain and maintain a classification shall participate in, record, and maintain documentation of these completed exercises.
2. For OSROs using a combination of owned and contracted resources to meet the requirements for classification, exercises should include both categories of resources working together and integrating separate system components provided by multiple OSROs.
3. In addition to equipment deployment, exercises should include mobilization, transportation and logistics support aspects, especially as they relate to WCD Tier 1 resources.
4. While implementing plan holder exercise requirements per 33 CFR § 154.1055 and/or 33 CFR § 155.1060, 40 CFR § 300.212, or while implementing NPREP exercises, to the maximum extent practicable, OSROs are encouraged to work with plan holders, COTPs, and Area Committees to hold equipment deployment exercises in conjunction with annual spill management team and area exercises. Additionally, OSROs are encouraged to use these exercises as an opportunity to validate response strategies contained in response and contingency plans.

G. Personnel Training

1. The FRP and VRP regulations require plan holders to ensure response personnel are trained to perform their jobs in alignment with 33 CFR § 154.1050, § 155.1055, and § 155.5055. The OSRO classification program requires an OSRO to provide similar assurances. OSROs must conduct periodic training to reinforce required knowledge.
2. An OSRO should provide confirmation that it has identified the skills necessary to demonstrate in a response and show that personnel have received the proper training to perform in those areas. Training records and descriptions of the methods in which training is delivered to personnel shall be available for review. An effective response training program should include, but is not limited to, the following:
    a. Actions to take in accordance with designated job responsibilities;
    b. Occupational Safety and Health Administration (OSHA) requirements outlined in 29 CFR § 1910.120;
    c. A clear, streamlined communication program; and
    d. Training on specific response equipment identified in the OSRO application for all classification programs.
3. OSROs shall maintain training records for three years following completion of the training. All records must be available for review during a PAV.

H. Equipment Maintenance

1. An OSRO must ensure that response resources listed in its application are inspected periodically and maintained in good operating condition in accordance with the manufacturer's recommendations, best commercial practices, and as per 33 CFR § 154.1057, § 155.1062, and §

155.5062. This includes ancillary equipment, such as hoses, secondary pumps and trailers. OSROs should have a clear, preventative and corrective maintenance system in place. Furthermore, OSROs must document all inspections and maintenance and maintain the records for three years. All maintenance records must be available for review during the PAV.

I. Resource Requirements

1. The number of personnel needed to support a response depends on numerous factors. For the OSRO classification program, the number of personnel required for a classification for each COTP zone or ACC is based on the location of resources and certain environmental and geographic factors. During the application process, through the RRI, an OSRO will identify, per the guidance contained herein, the number of personnel required to mobilize and operate the resources at each of its resource sites.
2. Each site that meets the time requirements for a classification should have its personnel requirements totaled for that classification. If the OSRO has identified sufficient personnel that meet the response time requirements and concurrently deploys and operates all equipment necessary for that level of classification, then an OSRO qualifies for the resource requirement of that specific classification.
3. Resources counted for OSRO classification can be owned or contracted and dedicated or non-dedicated. Since non-dedicated resources may not be available to respond immediately, extended notification and mobilization times are assigned to these resources. FRP and VRP regulations require plan holders to ensure the availability of response resources by contract or other approved means. OSROs must meet these same requirements for all response resources (dedicated, non-dedicated, owned and non-owned equipment and personnel) that they claim for classification purposes. The resource owner should list all contracted equipment in the RRI prior to an OSRO listing a resource as contracted.
4. OSROs shall ensure the resource information in the RRI is accurate to maintain classification and service plan holders.
5. A full and up-to-date inventory in the RRI will help COTPs and Area Committees know what response resources are available in their zones. Though not a requirement, Coast Guard requests that OSROs enter their full equipment inventory into the RRI, and not just the minimum needed for classification.

J. Response Times

1. OSROs are required to meet certain response times as per 33 CFR § 154.1045, § 154.1047, § 155.1050, § 155.1052, § 155.5050 and § 155.5052. The regulations set the response times for classification; the RRI standardizes the classification through a series of calculations. To receive a classification for a specific COTP zone or ACC, an OSRO must ensure its resources and trained personnel are able to meet the specified response times in that area.
2. Plan holders are required to use OSROs that are able to respond with resources from where they are stored to the incident location in accordance with various regulations in 33 CFR 154 and 155. The Coast Guard uses criteria in regulation to determine response times to the COTP city and ACCs when determining classification. A plan holder is then required to determine the

response time to the facility location or vessel location farthest from the response equipment storage site when different from the COTP city or ACC.

3. The RRI computes response times for the Mechanical and Dispersant classification programs by combining the notification times, mobilization times, and travel times of the resource sites used for a specific classification. Response plan regulations require the plan holder to include the time for notification, mobilization, and travel when computing response times (33 CFR § 154 Appendix C, paragraph 2.6 and 33 CFR § 155 Appendix B, paragraph 2.6). Therefore, the time needed for a resource to move from its primary staging site to a classification point is the sum of the notification, mobilization, and travel times.

4. Mobilization is the time it takes to get the resources assembled and prepared at the staging site. Mobilization begins once notifications are complete and ends when the resources are ready to move off-site. The time to notify and mobilize resources at a site is largely based on how much control the OSRO has over those resources (i.e., dedicated, non-dedicated, owned and contracted). For this reason, different mobilization times are used for calculating OSRO classifications based on resource status (see Table 1-2 below). Using this table, an OSRO determines the notification/mobilization time for each response resource included in its application, and provides that information on the status of each response resource during the application process. *Note: Full-time personnel are a dedicated resource; part-time personnel are a non-dedicated resource. On-site indicates a 24-hour staffed resource site, as opposed to personnel who have to be recalled. Also, add one half hour to response time to account for the time between the discovery of discharge and the notification to the OSRO.*

Table 1-2: Resource Notification/Mobilization Response Times in Hours

Resource Status	Response Personnel Availability	
	On-Site (OS)	Recall (R)
Owned/Dedicated (O/D)	1	2
Contract or Dedicated (C/D)	1.5	2.5
Owned/Non-dedicated (O/ND)	2.5	3.5
Contract /Non-dedicated (C/ND)	3	4

5. Travel times are computed using standard speeds and the highway or water distance between an OSRO site and a COTP office address or coordinates of the ACC. The distance is calculated in a direct line, but it is the responsibility of the plan holder, in coordination with the OSRO, to ensure the response resources can arrive within the timelines specified in applicable regulations.

6. As previously mentioned, the regulation uses travel speeds of 35 miles per hour (mph) for land, 5 kts for water, and 100 kts for aircraft for OSRO classification calculations. The regulation divides the distance by the speed to determine the travel time using the equation below. The total response time assigned to each site is the sum of the notification time, mobilization time, and travel time to the geographic point.

Travel Time = (Distance between OSRO Site and COTP Zone or ACC) / Travel Speed
Total Response Time = Notification Time + Mobilization Time + Travel Time

K. Status Changes in Equipment or Capabilities

1. Once classified, an OSRO shall report any significant changes made to its response resources to the NSFCC and COTP within 72 hours.
    a. The regulation defines "significant changes" as a reduction in the OSRO's classified capacity by a factor of 10% or greater, for a period of 48 hours or longer.
    b. Additional changes should also be updated in the RRI within 72 hours in the case of moving equipment from one site location to another site or deleting equipment that is no longer functioning that could impact classification.
2. Reductions in OSRO capabilities caused by surging of equipment into another COTP zone during a response may result in a loss of OSRO classification if it drops their capabilities below their classification threshold.
3. For changes in coverage due to planned maintenance that will exceed 48 hours, the OSRO should provide NSFCC , the appropriate COTP(s) and its plan holders using their resources, with as much advance prior notice as possible along with a description of the reduction in capability and any proposed mitigating measures.
4. The NSFCC reviews any mitigating measures submitted by an OSRO and either approves, proposes, or requests more information from the OSRO. The NSFCC, in consultation with the applicable COTP and CG-MER, determines if the OSRO needs to provide additional mitigating measures based on the amount of time the equipment is to be out of service, the expected decrease in coverage, and the areas impacted. If mitigating measures are approved, the NSFCC will coordinate notifications to affected COTPs. Any mitigating measures implemented by an OSRO should commence prior to the start of the planned gap. If the mitigating measures do not meet the requirements for classification, then the OSRO will lose its classification until it restores full coverage.
5. The RRI has a feature that notes when an OSRO site has been verified last by a user from the OSRO. This new mechanism will notify the NSFCC when an OSRO site's inventory has not been updated or verified in the last six months. If this occurs, the NSFCC will contact the OSRO and prompt them to verify the site's inventory.

L. OSRO Guidelines Biannual Review

The NSFCC and CG-MER shall conduct a biannual review and update process of the *Guidelines for the U.S. Coast Guard Oil Spill Removal Organization Classification Program*.

CHAPTER 2. Preparedness Assessment Visits (PAV)

A. Introduction and Purpose

1. PAVs are a critical component of the oil spill response preparedness system, providing on-site verification of resources and their condition.
2. NSFCC, DRAT, and COTP personnel shall collaborate with industry representatives on PAVs to ensure thorough oversight and awareness of the OSROs (and their capabilities) within their area of responsibility.
3. The PAV program encompasses various stages geared towards classifying OSROs for specific response thresholds, ensuring OSRO resources are consistent with classifications, examining equipment systems, and reviewing maintenance and training programs.
4. The Coast Guard may visit each location listed in the OSRO's application to account for and verify all listed resources, including both owned and contracted equipment and locations.
5. The following guidance within this chapter provides OSROs with an overview of the PAV process and a basic framework of what to expect during a PAV.

B. Roles and Responsibilities

1. CG-MER serves as the program office for the OSRO classification program. CG-MER shall:
   a. Provide the NSFCC with requested VRP information to include, but not limited to, which OSROs serve as resource providers for vessel plan holders, which COTP zones the vessels operate in, and any other related information;
   b. Assist the NSFCC with coordinating or conducting PAVs when requested by the NSFCC, and shall attend two PAVs annually; and
   c. At the beginning of every fiscal year, facilitate a PAV scheduling conference call between CG-MER, the NSFCC, and DRAT Supervisors.
2. The Commanding Officer of the NSFCC serves as the Administrator of the OSRO classification program, including all components of the PAV process. The NSFCC leads or coordinates all PAVs. In addition, the NSFCC shall:
   a. Maintain a list of OSROs, their classification status (if applicable), and when they last received a PAV;
   b. Annually schedule PAVs. Ensure DRATs and COTP personnel have access to the PAV schedule;
   c. Schedule and coordinate spot check PAVs when requested by DRAT or COTP;
   d. Notify applicable DRATs and COTP personnel to assist with application process outlined in Figures 1-1 and 1-2 of these guidelines;
   e. Ensure DRATs and COTP personnel have access to RRI and other applicable PAV documentation in advance of a scheduled PAV;

f. Notify OSROs of a scheduled PAV, or spot check PAV, and designate one point of contact for OSROs to communicate questions beforehand;

g. Complete an After Action Report (AAR) for each COTP zone or ACC, and archive and send it to CG-MER, the applicable DRAT, and COTP;

h. Brief the COTP upon completion of a PAV and assist with the identification of OSRO equipment shortfalls or issues;

i. Lead or facilitate coordination of PAV spot checks within COTP zones or ACCs; and

j. Notify CG-MER of changes to classifications based on new input and determinations from PAVs

3. The DRAT Supervisor, or their representative, shall serve as the District representative for PAVs and shall work with the FOSC, COTP personnel, National Strike Force (NSF) representatives, and other federal, state, local, and tribal stakeholders to optimize District pollution response preparedness. DRAT Supervisors (or their representative) shall:

   a. Maintain a comprehensive knowledge of OSRO inventories located throughout the District;

   b. Provide the District Commander and COTPs information on pollution response equipment capabilities, strategies, and operations;

   c. Assist the NSFCC with PAV coordination and when operationally available, assist with the PAV;

   d. Assist the NSFCC with the COTP brief upon completion of a PAV;

   e. Identify District response equipment shortfalls, including the identification of any challenges associated with cascading equipment into or within the District;

   f. Coordinate with the NSFCC to schedule a spot check PAV when the DRAT/COTP determines a spot check PAV is needed; and

   g. Brief results of PAV spot checks, upon completion, to the NSFCC and COTP.

4. COTPs should provide, when operationally available, representatives to assist with a PAV. Also, COTPs shall:

   a. Upon request from the NSFCC or DRAT, provide the NSFCC or DRAT with required FRP information to include, but not limited to, which OSROs serve as resource providers for facility plan holders, and any other related information;

   b. Notify the DRAT when a PAV spot check is deemed appropriate;

   c. Provide feedback to the NSFCC and DRATs if they observe discrepancies during an actual response or exercise.

5. The NSFCC and CG-MER shall coordinate on all decisions that affect the OSRO classification program and the PAV process.

C. Types and Frequency of Preparedness Assessment Visits

1. To clarify roles and responsibilities, the following is a list and broad overview of the types of PAVs and expected participants:

   a. **Routine PAV** – Participants: NSFCC (lead), DRAT, servicing NSF team and COTP personnel. A routine PAV verifies response equipment listed within RRI and the OSRO's application for classification at the time of the visit. The Coast Guard will assess OSROs using the process outlined in Sections D through G of this chapter within the scheduled COTP zone or ACC.

      (1) **Frequency** – An OSRO should expect one routine PAV every four years. The Coast Guard schedules these PAVs based on higher volume port areas (HVPAs), National Preparedness for Response Exercise Program (PREP) exercise schedule, high-risk geographic locations, COTP zones, Government-Initiated Unannounced Exercise (GIUE) performance, ACCs and upon specific requests from a District Commander or COTP. The COTP reserves the right to increase the frequency of PAVs or conduct PAV spot checks within their respective zone and shall coordinate directly with the NSFCC.

      (2) **Other Government Agency (OGA) Equipment Verifications (EVs)** - Other agencies have initiated the development of their own equipment verification programs. To strengthen interagency collaboration while reducing a duplicative burden on the OSROs, the Coast Guard should coordinate with its interagency partners prior to conducting PAVs. The Bureau for Safety and Environmental Enforcement (BSEE), the U.S. Environmental Protection Agency (EPA), and the Pipeline and Hazardous Materials Safety Administration (PHMSA) have all initiated their own equipment verification programs.

   b. **PAV Spot Checks** – Participants: NSFCC (coordinator), DRAT, servicing NSF team and COTP personnel. PAV spot checks are conducted on OSROs that participate in the program. PAV spot checks verify requirements outlined in Sections D through G of this chapter and that the equipment listed within RRI is up to date. PAV spot checks may be utilized to verify corrective action when prior OSRO system or documentation discrepancies are recorded during a past PAV, exercise, or response, or at the discretion of the COTP. PAV spots check may occur announced or unannounced.

      (1) **Frequency** – Contact NSFCC in order to conduct a PAV spot check. At the beginning of every fiscal year, the NSFCC, CG-MER, and DRATs will meet to coordinate PAV spot checks. Once the dates for the aforementioned PAVs, verifications for alternatives, and interagency equipment verifications are finalized, the PAV spot checks will be individually scheduled between each DRAT and their COTPs when operationally feasible. PAV spot checks are mutually (COTP/DRAT) determined based on risk, personnel availability, and feedback from COTPs concerning the requested quantity of PAV spot checks and how many OSRO sites can be assessed.

D. Preparedness Assessment Visit Process

1. Once the NSFCC or PAV team schedules the PAV for an owned and/or contracted OSRO site, the PAV team lead will print the OSRO's RRI data for that particular location. OSROs shall notify the PAV team lead or the NSFCC as soon as possible if unscheduled operations or other challenges may limit the scope or timing of the PAV.

2. Prior to visiting the OSRO site, the PAV team should review the classification(s) that particular OSRO holds and the associated guidance contained within these guidelines. At the minimum, the PAV team shall complete the following process:
   a. Complete a visual survey of all listed resources and operate at least 10% of listed equipment systems to ensure satisfactory condition and function to include (when applicable):
      (1) Boom;
      (2) Vessels;
      (3) Skimmers;
      (4) Vacuum systems;
      (5) Product transfer pumps;
      (6) Temporary storage;
      (7) Dispersants;
      (8) Dispersant delivery systems;
      (9) Aerial oil tracking aircraft (manned or unmanned);
      (10) Nonfloating oil resources (detection, recovery);
      (11) Shoreline cleanup resources; and
      (12) Miscellaneous OSRO equipment (e.g., salvage and marine firefighting equipment, hazardous material response equipment, oil-water separators).
   b. Ensure response resources are properly maintained. Verify that a preventative and corrective maintenance system is in place. Validate maintenance-related documentation.
   c. Verify the OSRO personnel listed as available and trained to mobilize, deploy, and operate the equipment.
   d. Verify compliance with all Hazardous Waste Operations and Emergency Response (HAZWOPER) requirements listed in 29 CFR § 1910.120 and ensure documentation accurately reflects all listed personnel who have satisfactorily completed HAZWOPER.
   e. Verify the response inventory's operability and logistic support capability. Where applicable, review the site's logistic narrative and determine the status of the support services listed in the narrative (e.g., equipment rentals, commercial drivers, personnel services) plus their ability to mobilize and sustain the resources.
   f. Verify records of exercise participation, including AARs or lessons learned, to ensure the OSRO continues to improve operations and is rectifying previous areas of concern.
3. While the aforementioned process is the primary framework, it is not all-inclusive. The Coast Guard PAV team lead may determine a more in-depth look is required to verify a specific component in the OSRO's operation.

E. Personnel Training

1. The Coast Guard verifies that response personnel at the resource site are trained in accordance with HAZWOPER regulations (29 CFR § 1910.120) and other job-specific requirements (e.g., commercial driver's license (CDL), diver certifications or merchant mariner credential) by conducting a review of personnel training records located at the OSRO site.
2. Prior to the Coast Guard's visit, the OSRO should review personnel records and subcontracting or consulting agreements to verify the number and availability of trained personnel listed within the RRI. The OSRO should provide these records to the Coast Guard upon request.

F. Examination of Equipment Systems and Maintenance Records

1. The PAV conducts a review of the OSRO's listed resources as required by the appropriate classification program and level. When completing the visual equipment survey, the Coast Guard will examine equipment systems from each classification category. All systems that count toward classification should be in working order and able to be deployed into the marine environment. While PAVs are not an operational equipment deployment exercise, the verification of the equipment's ability to function properly is key. During the PAV, if an OSRO cannot account for the equipment's proper operation (recent spill or exercise), they may be required to operate one or more systems for the PAV team. PAV team leads are encouraged to operate equipment as "systems" rather than as individual components of a system (i.e., testing compatible pumps and skimmers)
2. In addition to a physical examination of equipment systems, the PAV team will conduct a review of all applicable equipment maintenance record as required by 33 CFR § 154.1057, 33 CFR § 155.1062, and 33 CFR § 155.5062. Records should be maintained on-site at manned locations, and include the equipment maintenance history and proof of ownership, lease, or subcontract. At unmanned sites with staged equipment, the OSRO should have equipment maintenance records readily available.

G. Preparedness Assessment Visit Equipment Criteria

1. The PAV team should consider, when applicable, the following criteria (not all-inclusive):
    (1) Boom:
        (a) Overall condition;
        (b) Evidence of ownership, lease, or subcontract;
        (c) Manufacturer, type, and quantity;
        (d) Compatibility of connectors;
        (e) Number and adequacy of anchors;
        (f) Transportability;
        (g) Planned operating area(s); and
        (h) Condition of shoreline cleanup boom.
    (2) Recovery Devices (Skimmers and Vacuum Trucks):

(a) Evidence of ownership, lease, or subcontract;

(b) Manufacturer, type, model, and throughput capacity;

(c) Compatibility of components (e.g., hoses, suction and skimmer head, couplings and connectors);

(d) Operability and maintenance;

(e) Condition of the prime mover and other supporting equipment;

(f) Holding capacity;

(g) Planned operating area(s); and

(h) Condition of shoreline cleanup boom.

(3) Oil Spill Response Vessels (Skimmers, Barges, and Support Craft):

(a) Evidence of ownership, lease or subcontract;

(b) Operability and maintenance;

(c) Storage capacity, shelf life and/or expiration date;

(d) Inspection/certification;

(e) Planned operating areas;

(f) Grade of oil carried;

(g) Offload capability; and

(h) Length, beam, draft, range, transit speed and crew size.

(4) Temporary Storage Devices:

(a) Evidence of ownership, lease or subcontract;

(b) Manufacturer, type and model (as applicable);

(c) Capacity (twice the daily capacity of recovery devices);

(d) Inspected and maintained in accordance with manufacturer's recommendations;

(e) Contracted barges with current certificates;

(f) Planned operating area(s);

(g) Grade of oil carried; and

(h) Location of fixed storage.

(5) Boats:

(a) Sufficient numbers of trailers, outboard motors and Coast Guard-required safety equipment (life jackets, lights, etc.);

(b) Types and number of boats appropriate to the area of classification;

(c) Operability and maintenance;

(d) Length, beam, draft, range, transit speed and crew size;

(e) Adequate working platform for oil spill response; and

(f) Certification/registration.

(6) Dispersants:

(a) Manufacturer, type and quantity;

(b) Volumes of dispersant(s) to support WCD tiers;

(c) Stowage;

(d) Identification of dispersant product resource provider;

(e) Primary staging site location;

(f) Distance between product's home base and primary staging site;

(g) Amount of each stockpile required to support required effective daily application capacity (EDAC) of each dispersant application platform;

(h) Capability of commencing dispersant application operations at site of discharge within seven hours of decision by FOSC; and

(i) EDAC determination using Estimated Dispersant System Potential (EDSP) calculator.

(7) Application Platforms:

(a) Type;

(b) Providing resource organization;

(c) Distance between platform's home base and identified primary dispersant staging site; and

(d) Dispersant payload for each dispersant application platform.

(8) Aerial Oil Tracking and Application Capabilities:

(a) Identification of resource provider;

(b) Type and location of aerial surveillance aircraft available, through contract or other approved means;

(c) At least 50% of each EDAC tier requirement must be achieved through the use of fixed-wing aircraft-based application platforms;

(d) Capability of arriving at the site of a discharge in advance of the arrival of response resources identified in the plan for WCD Tiers 1, 2 and 3 response times, and for a distance up to 50 nautical miles (NM) from shore (excluding inland areas);

(e) Capability of supporting oil spill removal operations continuously for three 10-hour operational periods during the initial 72 hours of the discharge; and

(f) Numbers of aircraft, pilots, and trained observation personnel.

(9) Nonfloating Oil Response Resources:

(a) Evidence of ownership, lease, or subcontract;

(b) Identification of resource provider;

(c) Industry and professional certifications;

(d) Condition of detection and recovery equipment;

(e) Information management of software systems related to the detection and recovery equipment;

(f) Manufacturer, type, and model (as applicable);

(g) Operability and maintenance;

(h) Length, beam, draft, range, transit speed, and crew size;

(i) Capacity;

(j) Transportability;

(k) Primary staging site location;

(l) Inspected and maintained in accordance with manufacturer's recommendations;

(m) Contracted barges with current certificates;

(n) Planned operating area(s); and

(o) Location of temporary/fixed storage.

(10) Groups II-IV (within inland, near shore, or offshore where preauthorization exists):

(a) Capability of commencing dispersant application operations at site of discharge within seven hours of decision by FOSC; and

(b) Capability to meet Tier 1, 2, and 3 response times for completed applications listed in Table 33 CFR § 155.1050(k).

(11) Records and Labeling:

(a) Equipment must be clearly marked for identification;

(b) Records must be available that support claims of ownership, lease, or subcontract;

(c) Complete maintenance records reflecting condition of equipment;

(d) Dispersant plans on site and updated (if applicable);

(e) Past three years of personnel training records must be made available; and

(f) Past three years of exercise records must be made available.

(12) Logistics Narrative. An OSRO shall provide a written narrative outlining the logistics requirements for each resource site listed in the RRI. Narratives need to provide enough information to document that an OSRO has the myriad and complex logistics support requirements for the mobilization and delivery of the response equipment and

personnel from each resource site to each COTP zone or ACC requested. Narratives might contain, but are not limited to:

(a) Methods of personnel recall (if applicable);

(b) Methods of loading resources for mobilization;

(c) Methods of resource transport off-site to incident or staging;

(d) Methods of mobilizing, deploying, and supporting resources;

(e) Special response resources staging (e.g., prepackaging, palletizing, preloading); and

(f) Necessary site support services (e.g., tractors, trailers, drivers, cranes).

H. Preparedness Assessment Visit Results

1. During the PAV, the team may identify deficiencies within the OSRO's inventory or documentation. The PAV team will identify the specific deficiencies for the OSRO and notify the NSFCC. The OSROs will have sufficient opportunity (normally 30 days) to correct the deficiencies. This process will not affect classification as long as the deficiency does not significantly reduce the OSRO's overall response readiness.
2. The NSFCC will inform the OSRO's representative of the timeline to correct the deficiencies. The OSRO will provide the NSFCC with appropriate documentation of the corrections. However, if the severity of the deficiencies sufficiently indicate that an OSRO is not capable of meeting its classification requirements, the Coast Guard may immediately reduce or revoke the OSRO's classification until the deficiencies are corrected. OSROs unable to meet the NSFCC's predetermined deadline will have to be reevaluated through the full application process.
3. Once the OSRO has submitted proof of corrective action, the COTP/DRAT, in coordination with the NSFCC, shall conduct a PAV spot check on the recorded deficiencies within 60 days to ensure compliance. If the OSRO fails the PAV spot check, its classification will be removed.
4. For minor discrepancies, an in-person spot check may not be required. Some discrepancies may be able to be addressed via proper documentation and transmittal from the OSRO to the NSFCC.
5. If an OSRO disagrees with the results of a PAV, the OSRO may submit an appeal in writing to the Commanding Officer of the NSFCC within 30 days of the PAV. If the OSRO remains unsatisfied with the determination after the appeal, the OSRO may submit a second appeal to CG-MER.
6. An After Action Report (AAR) will be completed by the NSFCC after all PAVs or spot-checks and will be filed in the RRI and shared with internal Coast Guard stakeholders.

I. Other Reasons for Downgrading an OSRO's Classification

1. Other reasons for downgrading a classification can include, but are not limited to:
   a. The PAV team could not verify resources listed by the OSRO in the RRI and/or could not match the resources to the classification level requirements.

b. Response resources are unable to meet response times or do not function properly during drills, exercises, responses, and PAVs.

c. The OSRO fails to meet the training, maintenance, and exercise provisions of these guidelines.

CHAPTER 3. Mechanical Classification Requirements for OSROs

A. Overview

1. The Coast Guard classifies OSROs based on the location of their response resources and an assessment of their ability to mobilize those resources to the COTP zone or ACC. There are equipment standards and response times specific to each operating area within a COTP zone. Additional requirements are outlined for the Prince William Sound, Alaska COTP zone and shallow water environments. This chapter also discusses exercises, personnel training, and equipment maintenance specific to the OSRO classification program for Mechanical OSROs.

2. If an OSRO uses aircraft transport response resources, the resource must be linked to the appropriate aircraft in the RRI.

B. Resource Requirements

1. The Coast Guard separates core resources into five categories: protective boom, EDRC containment boom, TSC, response vessels, and personnel. Both protective and containment boom are measured in feet, EDRC is measured in barrels per day (bbls/day), and TSC is measured in barrels (bbls).

C. Protective Boom

1. VRP regulations require a plan holder to have a specific amount, size, and type of boom available for shoreline protection purposes for MMPDs and WCDs per 33 CFR § 155, Appendix B, Table 1. For classification purposes, it is assumed the OSRO has both vessel and facility clients. Since the protective boom requirements for VRP holders are more restrictive and specific, these requirements are used for OSRO classification per 33 CFR § 155 Appendix B, paragraph 5.6.

2. If an OSRO certifies that it only serves facility customers, it can submit, in writing to the NSFCC, a request to base its protective boom requirements on the amount specified in the ACP and FRP for the relevant COTP zone in accordance with 33 CFR § 154 Appendix C, paragraph 5.6.

D. Oil Recovery Device Operating Environment

1. Per 33 CFR § 155 Appendix B, Table 1, oil recovery devices must be at least capable of operating in wave heights up to and including the values listed in Table 1 of the regulation.

2. OSROs must ensure the skimmers they enter in the RRI are capable of operating within the environments for which they are seeking classifications, based on the manufacturer's listing.

E. EDRC and Containment Boom

1. EDRC, containment boom, and response vessels are interrelated for OSRO classifications. For planning purposes, the Coast Guard counts EDRC credit only toward an OSRO's classification if there is, at a minimum, 300 feet of containment boom available to be deployed in the applicable operating area to complete each skimming system.

2. Per 33 CFR § 154.1045, an OSRO must have 1,000 feet of containment boom or two times the length of the largest vessel that regularly conducts petroleum oil transfers to or from the facility, whichever is greater, in addition to the 300 feet per skimming system required to

complete a skimming system. OSROs must identify response vessels to support the recovery devices that also meet the specific FRP and VRP time requirements outlined in these guidelines.

F. Temporary Storage Capacity

1. An OSRO must identify TSC equaling twice the EDRC included in a classification application as required by 33 CFR § 154 Appendix C, paragraph 9.2 and 33 CFR § 155 Appendix B, paragraph 9.2. TSC and EDRC are interrelated. The regulation limits an OSRO's classification by the lowest-rated component of the recovery system. For example, if an OSRO has 10,000 bbls/day EDRC, but only has available 14,000 bbls TSC, then its recovery capacity is limited to 7,000 bbls/day (one half of the available TSC capability).

2. Non-dedicated TSC, for the purposes of this classification program, includes any TSC supplied by tank barge and mobile storage. Tank barges and mobile storage are assumed to be engaged in transporting oil between various locations and full of oil half of the time. Therefore, tank barges and mobile storage are only fully capable of supplying the total amount of TSC required half of the time. As a result, non-dedicated temporary storage would normally not qualify for the requirement specified by 33 CFR § 154.1045(g), which states that response equipment must mobilize within two hours for a MMPD and WCD1 classification. As an exception, the USCG's OSRO classification program allows non-dedicated tanker barges and mobile storage (i.e., vacuum trucks) to qualify for the MMPD and WCD1 mobilization if the non-dedicated TSC is provided at a 2:1 ratio, and the non-dedicated TSC is always capable of arriving at the COTP or ACC location within the time required for MMPD and Tier 1 classification.

3. OSROs can use dedicated mobilization offset times for non-dedicated TSC resources if the non-dedicated TSC resources are provided at two times the TSC requirement using mutually exclusive assets, also known as a 2:1 ratio. This exception is only available to tank barges and mobile storage and is not available to fixed storage. Mobile storage is limited to 45% of the total TSC and fixed storage is limited to 35% of the total TSC.

4. OSROs can identify fixed storage tanks ashore to meet the TSC requirements in limited circumstances. The NSFCC will accept them only for OSRO classifications covering the rivers/canals, Great Lakes, and inland operating areas. They are allowed for up to 35% of an OSRO's TSC, provided an OSRO certifies that it can transport recovered oil to the fixed tanks ashore and sustain the required EDRC. The Coast Guard does not allow shore-side fixed storage tanks in the near shore, offshore, or open ocean operating areas.

5. Vacuum trucks are limited to a maximum of 45% of the total TSC in the rivers/canals, Great Lakes, and inland operating areas. They are not permitted for EDRC and TSC credit in the near shore, offshore and open ocean operating areas. An OSRO may however provide proper documentation from the applicable COTP authorizing on-deck vehicle(s) transport of EDRC and TSC capability for all operating areas. All vacuum trucks receiving EDRC credit require 300 feet of containment boom as part of the system.

G. Response Vessels

1. Response vessels are integral to every response. OSROs should clearly identify the vessels intended for response services in the RRI. Although response vessels are not calculated programmatically into a classification, the NSFCC reviews available response vessels. If a

shortfall is perceived, further discussion with the OSRO is warranted before a classification is considered.

2. The Coast Guard will only consider response vessels that meet the response time requirements by tier as outlined in these guidelines. All response vessels identified must meet applicable Coast Guard regulations and policy guidelines (e.g., navigation lights, safety equipment, life vests).

H. Response Aircraft

1. Response aircraft, whether manned or unmanned, are essential for tracking oil spills and assessing the impact of the spill. Aircraft intended for response services should be clearly identified in the RRI. Plan holders must identify in their response plan, and ensure the availability through contract or other approved means, those response resources necessary to provide aerial oil tracking to support oil spill assessment and cleanup activities as per 33 CFR § 155.1050(l) and 33 CFR § 155.5050(k). Facilities operating exclusively on inland rivers are not required to comply with this paragraph.
2. OSROs should ensure response aircraft are capable of supporting oil spill removal operations continuously for three 10-hour operational periods during the initial 72 hours of the discharge.
3. OSROs should include appropriately located aircraft and personnel capable of meeting the response time requirement for oil tracking, and a sufficient number of aircraft, pilots, and trained observation personnel to support oil spill removal operations, commencing upon initial assessment, and capable of coordinating on-scene cleanup operations, specifically mechanical recovery operations in this case.
4. OSROs must train observation personnel in the protocols of oil spill reporting and assessment, including estimation of slick size, thickness, and quantity. These trained personnel must understand the use of assessment techniques in American Society for Testing and Materials (ASTM) Standard F1779, and be familiar with the use of other guides, such as the National Oceanic and Atmospheric Administration's (NOAA) *Open Water Oil Identification Job Aid for Aerial Observation* and *Characteristic Coastal Habitats* guides.
5. All response aircraft identified must meet applicable Coast Guard and FAA regulations and policy guidelines.

I. MMPD and WCD Tier 1 Classification

1. Only resources located at equipment sites capable of being mobilized and in route to the scene of a spill within two hours of notification are counted toward MMPD and WCD1 classifications. Because of the potential for non-dedicated resources to be committed to other functions, only dedicated resources are presumed to be able to mobilize within these time requirements.

J. WCD Tier 2 and WCD Tier 3 Classifications

Owned, contracted, dedicated, and non-dedicated equipment may be used for WCD2 and WCD3 classification.

K. Dedicated vs. Non-dedicated Resources

1. Since non-dedicated tank barges used for TSC credit may operate significant distances from their classification resource sites, an OSRO must further ensure the availability of non-dedicated barges by contract or other approved means in quantities equal to twice what the OSRO requires of the dedicated resources.
2. FRP and VRP regulations specify the quantity of resources required for specific planning volumes. The regulations categorize requirements as the MMPD and WCD (see below for planning volumes), and further divide WCD into Tiers 1, 2, and 3.
3. FRP and VRP regulations establish MMPD and WCD from a calculation using a facility's largest foreseeable oil discharge or a vessel's cargo volume, as shown in Table 3-1 below.

Table 3-1: Planning Volumes for Discharge Categories

Category	Facility	Vessel
MMPD*	1,200 bbls or 10% of WCD	2,500 bbls or 10% of WCD
WCD*	Largest foreseeable oil discharge in adverse weather conditions	A discharge in adverse weather conditions of a vessel's entire fuel or oil cargo, whichever is greater

**Defined in 33 CFR § 154.1020, § 155.1020, and § 155.5020*

4. Manufacturers design boom, oil recovery devices, and TSC equipment with certain operating areas in mind. In the response plan regulations, these operating areas are identified as rivers/canals, Great Lakes, inland, near shore, offshore, and open ocean. The OSRO classification program classifies OSROs based on these areas. The chapter on Specific Classification Standards by Operating Area (Chapter 4) lists specific requirements for boom, EDRC, and TSC for each of these areas. To receive an MMPD, WCD1, WCD2, or WCD3 classification, an OSRO must meet all boom, EDRC, and TSC requirements for the classification. Classification is determined independently for each operating area. See Tables 3-2, 3-3, and 3-4 on the following page for more details.

Table 3-2: Boom Amounts in Feet for OSRO Classifications

Area	Configuration	MMPD	WCD1	WCD2	WCD3
Persistent Oils (Groups II – IV)					
Rivers/Canals	Protective	4,000	25,000	25,000	25,000
Great Lakes	Protective	6,000	30,000	30,000	30,000
Inland	Protective	6,000	30,000	30,000	30,000

Offshore	2,400	25,000	50,000	100,000
Open Ocean	2,400	25,000	50,000	100,000

L. Response Times

1. Due to the respective differences in FRP and VRP regulations, the Coast Guard's OSRO classification program uses two major categories for response times: one for facilities and one for vessels. A summary of response times is listed in Table 3-5 on the next page.

2. If a COTP zone contains an HVPA, then response times for the Mechanical OSRO classification are more stringent. HVPA requirements are listed in 33 CFR § 154.1045, 33 CFR § 155.1050, and

33 CFR § 155.5050 include any area within 50 NM seaward of the port. The NSFCC does not typically authorize departure from mandated response times; however, if an OSRO cannot meet the reduced response times listed for HVPAs in Tables 3-5, 4-2, 4-6, and 4-7 of these guidelines, they must coordinate directly with the NSFCC.

Table 3-5: Response Times in Hours for Containment Boom, EDRC and TSC Resources

Area	Facility or Vessel	MMPD	WCD1	WCD2	WCD3
Rivers/Canals	Facility	12	12	36	60
	Vessel	24	24	48	72
	Facility HVPAs	6	6	30	54
	Vessel HVPAs	12	12	36	60
Great Lakes	Facility	6	12	36	60

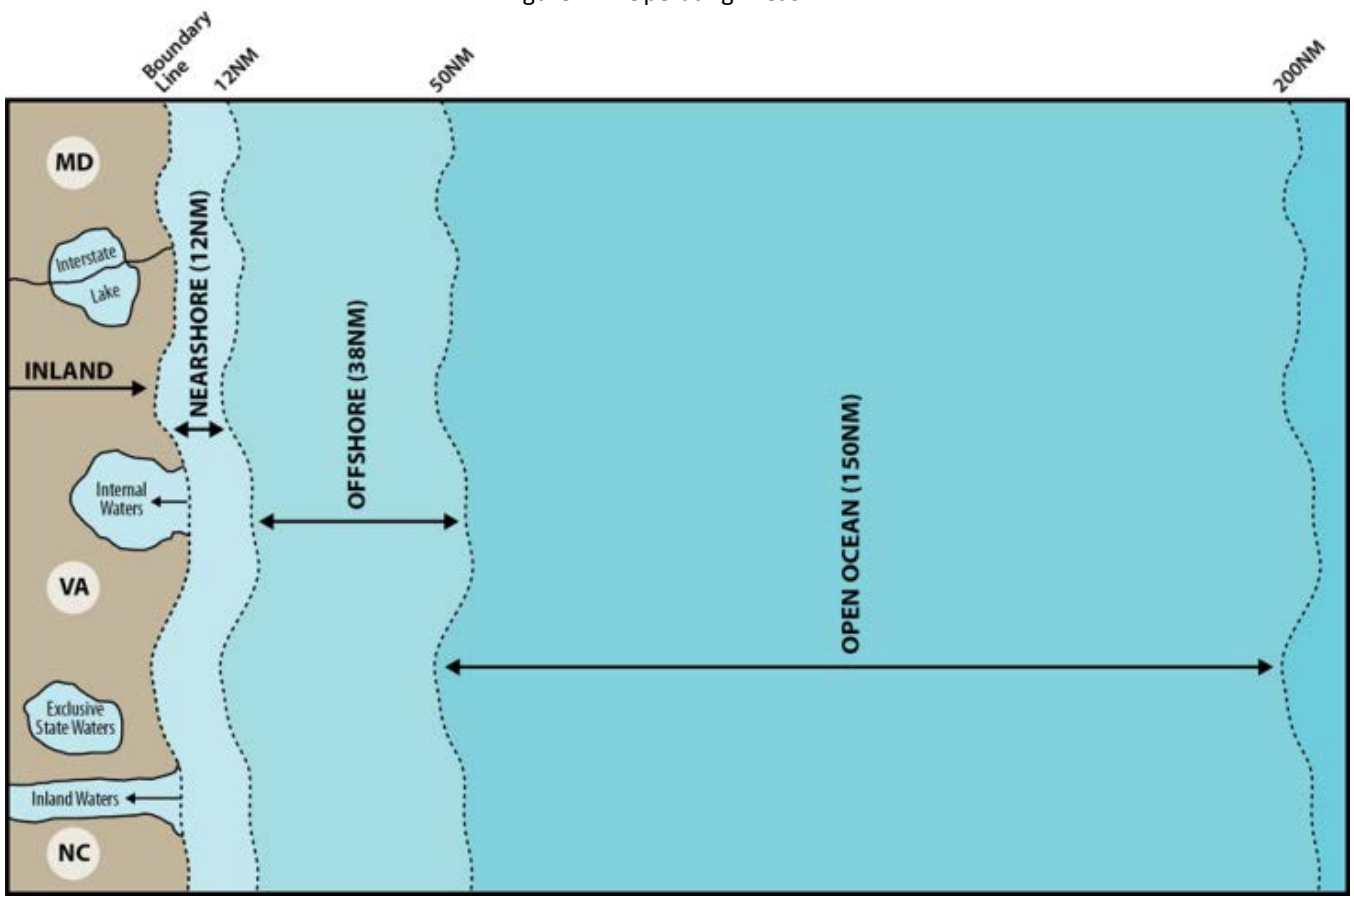
	Nontank Vessel	24	24	N/A	N/A

CHAPTER 4. Mechanical Classification Standards by Operating Area

A. Operating Areas

1. The operating areas for the Mechanical classification standard include inland, nearshore, offshore, and open ocean operating environments, as defined by 33 CFR § 154.2001 and 33 CFR § 155.1020 (see definitions in Appendix B of this document) and depicted in Figure 4-1 below.

Figure 4-1: Operating Areas



B. Adverse Weather Considerations

1. All equipment identified in a response plan must be capable of operating in the conditions expected within the geographic area in which a vessel operates. These conditions vary widely based on the location and season.

2. Vessels storing, handling, or transporting oil in more than one operating environment must identify equipment capable of successfully functioning in each operating environment. For example, vessels moving from the ocean to a river port must identify appropriate equipment designed to meet the criteria for transiting oceans, inland waterways, rivers, and canals. This equipment may be designed to operate in all of these environments or, more likely, different equipment may be designed for use in each area.

3. When identifying equipment, a vessel owner or operator must consider the inherent limitations in the operability of equipment components and response systems. The criteria in Table 1 of Appendix B to 33 CFR § 155 must be used for evaluating the operability in a given environment. These criteria reflect the general conditions in certain operating areas.
4. Table 1 of Appendix B to 33 CFR § 155 lists criteria for oil recovery devices and boom. All other equipment necessary to sustain or support response operations in a geographic area must be designed to function in the same conditions. For example, boats that deploy or support skimmers or boom must be capable of being safely operated in the significant wave heights listed for the applicable operating environment. The Coast Guard may require documentation that the boom identified in a response plan meets the criteria in Table 1 of Appendix B to 33 CFR § 155. Absent acceptable documentation, the Coast Guard may require that the boom be tested to demonstrate it meets the criteria in Table 1 of Appendix B to 33 CFR § 155. Testing must be in accordance with certain ASTM standards.
5. A vessel owner or operator must refer to the applicable ACP to determine if ice, debris, and weather-related visibility are significant factors in evaluating the operability of equipment. The ACP will also identify the average temperature ranges expected in a geographic area in which a vessel operates. All equipment identified in a response plan must be designed to operate within those conditions or ranges.

C. Shallow Water Requirements

1. Depending on the operating area, a certain percentage of OSRO resources must be capable of operating in waters of six feet or less as required by 33 CFR § 154.1045 and § 155.1050 (see Table 4-1 below). An OSRO must identify equipment in its application to meet this requirement.

Table 4-1: Percentage of Response Equipment Capable of Operating in Shallow Waters

Area	Facility	Tank Vessel
Rivers/Canals	20	20
Great Lakes	20	20
Inland	20	20
Near shore	20	20
Offshore	10	10
Open Ocean	None	None

D. Rivers and Canals

1. The following table summarizes the equipment standards and maximum response times for classifying OSROs for a planned response to spills in a river/canal operating area. All equipment to be used in this area must be capable of operating in 1-foot wave heights.

Table 4-2: Equipment Standards and Response Times for the Rivers/Canals Operating Area

Protective Boom (feet)	Containment Boom (feet)	Oil Recovery Equipment (bbls/day EDRC)	Recovered Oil Storage (bbls TSC)	Facility Response Times (hours)	Vessel Response Times (hours)
MMPD (1,200 bbls/day recovery)					
4,000	1,000 plus 300 per skimming system	1,200	2,400	6 for higher volume ports	12 for higher volume ports
				12 for all other locations	24 for all other locations
WCD1 (1,875 bbls/day recovery)					
25,000	1,000 plus 300 per skimming system	1,875	3,750	6 for higher volume ports	12 for higher volume ports
				12 for all other locations	24 for all other Locations
WCD2 (3,750 bbls/day recovery)					
25,000	1,000 plus 300 per skimming system	3,750	7,500	30 for higher volume ports	36 for higher volume ports
				36 for all other locations	48 for all other locations
WCD3 (7,500 bbls/day recovery)					
25,000	1,000 plus 300 per skimming system	7,500	15,000	54 for higher volume ports	60 for higher volume ports
				60 for all other locations	72 for all other Locations

d. Boom properties must include the following:

(1) Boom height (draft plus freeboard) (inches) = 6-18;

(2) Reserve buoyancy-to-weight ratio = 2:1;

(3) Total tensile strength (pounds (lbs)) = 4,500;

(4) Skirt fabric tensile strength (lbs) = 200; and

(5) Skirt fabric tear strength (lbs) = 100.

E. Great Lakes

1. The following table summarizes the minimum equipment standards and maximum response times for classifying OSROs for a planned response to spills in the Great Lakes operating area. All equipment used in this operating area must be capable of operating in 4-foot wave heights.

Table 4-3: Equipment Standards and Response Times for the Great Lakes Operating Area

Protective Boom (feet)	Containment Boom (feet)	Oil Recovery Equipment (bbls/day EDRC)	Recovered Oil Storage (bbls TSC)	Facility Response Times (hours)	Tank Vessel Response Times (hours)
MMPD (1,200 bbls/day recovery)					
6,000	1,000 plus 300 per skimming system	1,200	2,400	6	12
WCD1 (6,250 bbls/day recovery)					
30,000	1,000 plus 300 per skimming System	6,250	12,500	12	18
WCD2 (12,500 bbls/day recovery)					
30,000	1,000 plus 300 per skimming system	12,500	25,000	36	42
WCD3 (25,000 bbls/day recovery)					
30,000	1,000 plus 300 per skimming system	25,000	50,000	60	66

a. Boom properties must include the following:

(1) Boom height (draft plus freeboard) (inches) = 18-42;

(2) Reserve buoyancy-to-weight ratio = 2:1;

(3) Total tensile strength (lbs) = 15,000–20,000;

(4) Skirt fabric tensile strength (lbs) = 300; and

(5) Skirt fabric tear strength (lbs) = 100.

F. Inland

1. The following table summarizes the minimum equipment standards and maximum response times for classifying OSROs for the planned response to spills in the inland operating area. All equipment used in this operating area must be capable of operating in 3-foot wave heights.

Table 4-4: Equipment Standards and Response Times for the Inland Operating Area

Protective Boom (feet)	Containment Boom (feet)	Oil Recovery Equipment (bbls/day EDRC)	Recovered Oil Storage (bbls TSC)	Facility Response Times (hours)	Tank Vessel Response Times (hours)
MMPD (1,200 bbls/day recovery)					
6,000	1,000 plus 300 per skimming system	1,200	2,400	6 for higher volume ports	12 for higher volume ports
				12 for all other locations	24 for all other Locations
WCD1 (12,500 bbls/day recovery)					
30,000	1,000 plus 300 per skimming system	12,500	25,000	6 for higher volume ports	12 for higher volume ports
				12 for all other locations	24 for all other locations
WCD2 (25,000 bbls/day recovery)					
30,000	1,000 plus 300 per skimming system	25,000	50,000	30 for higher volume ports	36 for higher volume ports
				36 for all other locations	48 for all other Locations
WCD3 (50,000 bbls/day recovery)					
30,000	1,000 plus 300 per skimming system	50,000	100,000	54 for higher volume ports	60 for higher volume ports
				60 for all other locations	72 for all other locations

a. Boom properties must include the following:

(1) Boom height (draft plus freeboard) (inches) = 18-42;

(2) Reserve buoyancy-to-weight ratio = 2:1;

(3) Total tensile strength (lbs) = 15,000–20,000;

(4) Skirt fabric tensile strength (lbs) = 300; and

(5) Skirt fabric tear strength (lbs) = 100.

G. Near Shore

1. The following table summarizes the minimum equipment standards and maximum response times for classifying OSROs for the planned response to spills in the near shore operating area. With the exception of shoreline protection boom, all equipment used in this operating area must be capable of operating in 6-foot wave heights.

Table 4-5: Equipment Standards and Response Times for the Near Shore Operating Area

Protective Boom (feet)	Containment Boom (feet)	Oil Recovery Equipment (bbls/day EDRC)	Recovered Oil Storage (bbls TSC)	Facility Response Times (hours)	Tank Vessel Response Times (hours)
MMPD (1,200 bbls/day recovery)					
8,000	1,000 plus 300 per skimming system	1,200	2,400	6 for higher volume ports	12 for higher volume ports
				12 for all other locations	24 for all other Locations
WCD1 (12,500 bbls/day recovery)					
30,000	1,000 plus 300 per skimming system	12,500	25,000	6 for higher volume ports	12 for higher volume ports
				12 for all other locations	24 for all other locations
WCD2 (25,000 bbls/day recovery)					
30,000	1,000 plus 300 per skimming system	25,000	50,000	30 for higher volume ports	36 for higher volume ports
				36 for all other locations	48 for all other Locations
WCD3 (50,000 bbls/day recovery)					
30,000	1,000 plus 300 per skimming system	50,000	100,000	54 for higher volume ports	60 for higher volume ports
				60 for all other locations	72 for all other locations

a. Boom properties must include the following:

(1) Boom height (draft plus freeboard) (inches) = ≥ 42 containment; ≥ 18 shoreline protection;

(2) Reserve buoyancy-to-weight ratio = 3:1 to 4:1 containment; > 2:1 shoreline protection;

(3) Total tensile strength (lbs) = > 20,000 containment; > 15,000 shoreline protection;

(4) Skirt fabric tensile strength (lbs) = 500 containment; > 300 shoreline protection; and

(5) Skirt fabric tear strength (lbs) = 125 containment; > 100 shoreline protection.

H. Offshore

1. The following table summarizes the minimum equipment standards and maximum response times for classifying OSROs for the planned response to spills in the offshore operating area. All equipment used in this operating area must be capable of operating in 6-foot wave heights.

Table 4-6: Equipment Standards and Response Times for the Offshore Operating Area

Protective Boom (feet)	Containment Boom (feet)	Oil Recovery Equipment (bbls/day EDRC)	Recovered Protective Boom (feet)	Facility Response Times (hours)	Tank Vessel Response Times (hours)
MMPD (1,200 bbls/day recovery)					
8,000	1,000 plus 300 per skimming system	1,200	2,400	6 for higher volume ports	12 for higher volume ports
				12 for all other locations	24 for all other locations
WCD1 (12,500 bbls/day recovery)					
15,000	1,000 plus 300 per skimming system	12,500	25,000	6 for higher volume ports	12 for higher volume ports
				12 for all other locations	24 for all other locations
WCD2 (25,000 bbls/day recovery)					
15,000	1,000 plus 300 per skimming system	25,000	50,000	30 for higher volume ports	36 for higher volume ports
				36 for all other locations	48 for all other locations
WCD3 (50,000 bbls/day recovery)					
15,000	1,000 plus 300 per skimming system	50,000	100,000	54 for higher volume ports	60 for higher volume ports
				60 for all other locations	72 for all other Locations

a. Boom properties must include the following:

(1) Boom height (draft plus freeboard) (inches) = ≥ 42 containment; ≥ 18 shoreline protection;

(2) Reserve buoyancy-to-weight ratio = 3:1 to 4:1 containment; > 2:1 shoreline protection;

(3) Total tensile strength (lbs) = > 20,000 containment; > 15,000 shoreline protection;

(4) Skirt fabric tensile strength (lbs) = 500 containment; > 300 shoreline protection; and

(5) Skirt fabric tear strength (lbs) = 125 containment; > 100 shoreline protection.

I. Open Ocean

1. The following table summarizes the minimum equipment standards and maximum response times for classifying OSROs for the planned response to spills in the open ocean operating area. All equipment to be used in this operating area must be capable of operating in 6-foot wave heights.

Table 4-7: Equipment Standards and Response Times for the Open Ocean Operating Area

Protective Boom (feet)	Containment Boom (feet)	Oil Recovery Equipment (bbls/day EDRC)	Recovered Oil Storage (bbls TSC)	Facility Response Times (hours)	Tank Vessel Response Times (hours)
MMPD (1,200 bbls/day recovery)					
No requirements	1,000 plus 300 per skimming system	1,200	2,400	6 for higher volume ports	12 for higher volume ports
				12 for all other locations	24 for all other location
WCD1 (12,500 bbls/day recovery)					
No requirements	1,000 plus 300 per skimming system	12,500	25,000	6 for higher volume ports	12 for higher volume ports
				12 for all other locations	24 for all other location
WCD2 (25,000 bbls/day recovery)					
No requirements	1,000 plus 300 per skimming system	25,000	50,000	30 for higher volume ports	36 for higher volume ports
				36 for all other locations	48 for all other location
WCD3 (50,000 bbls/day recovery)					
No requirements	1,000 plus 300 per skimming system	50,000	100,000	54 for higher volume ports	60 for higher volume ports
				60 for all other locations	72 for all other location

a. Boom properties must include the following:

(1) Boom height (draft plus freeboard) (inches) = ≥ 42;

(2) Reserve buoyancy-to-weight ratio = 3:1 to 4:1;

(3) Total tensile strength (lbs) = > 20,000;

(4) Skirt fabric tensile strength (lbs) = 500; and

(5) Skirt fabric tear strength (lbs) = 125.

J. Prince William Sound Classification

1. The FRP and VRP regulations establish more stringent planning criteria for tank vessel plan holders loading cargo at a facility permitted under the Trans-Alaska Pipeline Authorization Act. The regulations also classify OSROs intending to respond in the Prince William Sound, Alaska COTP zone to the more stringent standard.

CHAPTER 5. OSRO Classification Dispersant Program

A. Introduction

1. NSFCC evaluates OSROs seeking classification for dispersants on their ability to apply safely set volumes of surface dispersant within set periods to the furthest 50 NM offshore areas within each COTP zone or ACC. This chapter provides guidance to OSROs concerning planning standards, core resource expectations, and how to meet the regulatory criteria of dispersant operations.

2. NSFCC separates core resources into four categories: dispersant product; EDAC; dispersant application platform; and aerial oil tracking and application capabilities. NSFCC calculates Dispersant classifications through the RRI and EDSP program.

3. NSFCC evaluates OSRO Dispersant classification levels, assesses the OSRO's dispersant plan, and estimates the EDAC for its dispersant application systems. The regulations (33 CFR § 155.1035, 33 CFR § 155.5035, and 33 CFR § 154.1035) only sanction the EDSP. The EDSP is available at https://www.bsee.gov/sites/bsee.gov/files/dispersants-cal.html. OSROs should contact the NSFCC prior to submitting their dispersant plan.

B. Response Plan Requirements

1. VRP and FRP regulations—specifically 33 CFR § 155.1035, 33 CFR § 155.5035, and 33 CFR § 154.1035—require a plan holder operating in any inland, near shore, or offshore area with pre-authorization for dispersant use to be able to apply enough dispersant to meet a WCD or the requirements in 33 CFR § 154.1045(i), 33 CFR § 155.1050(k), or 33 CFR § 155.5050(j), whichever is the lesser amount. The dispersant identified must be of a type listed on the National Oil and Hazardous Substances Pollution Contingency Plan (NCP) Product Schedule (400 CFR § 300.915). The plan must identify: specific dispersant application platforms and payloads; the primary dispersant staging site for each dispersant application platform; the platform type; resource provider; location; dispersant stockpiles and location; and trained personnel necessary to continue operation of the equipment and staff the OSRO and spill management team for the first seven days of the response.

2. If the Coast Guard has evaluated and classified an OSRO, then a plan holder may reference the classified OSRO in their response plan instead of listing all of the required dispersant resources.

C. Tier 1, 2, and 3 Worst Case Discharge (WCD) Classifications.

1. The Coast Guard categorizes Dispersant classifications by WCD Tiers 1, 2, and 3 and labels them WCD1, WCD2, and WCD3, respectively. The Dispersant classifications can be achieved independently of each other and each classification is determined separately for each COTP zone or ACC. The plan holder can then contract with multiple OSROs to fulfill its Tier 1, 2 and 3 requirements.

2. WCD1: To qualify for the WCD1 classification, an OSRO must be able to commence dispersant operations within seven hours and must be able to apply 8,250 gallons (gulf coast region)/4,125 gallons (all other U.S regions), within 12 hours of the FOSC's decision to use dispersants, as per 33 CFR § 155.1050(k) (1), 33 CFR § 155.5050(k) (1), and 33 CFR § 154.1045(i) (1). For planning

and classification purposes, the Coast Guard assumes that the FOSC's decision to use dispersants will occur at the time of spill notification. Therefore, an OSRO has seven hours to move dispersant stockpiles and commence dispersant operations. Dispersant-dedicated aerial oil tracking resources must be capable of being on-scene (50 NM offshore) within seven hours.

3. WDC2: To qualify for the WCD2 classification, an OSRO must be able to apply 23,375 gallons of dispersants in a 12-hour window within 36 hours of the FOSC's decision to use dispersants. For WCD2, planners can estimate the dispersant timeframe to begin at hour 24 and end at hour 36. To get credit for classification, 11,687 gallons of dispersant must arrive at the OSRO selected primary staging site within 24 hours of the FOSC's decision to use dispersants, and the remaining 11,688 gallons must arrive at the primary staging site within 30 hours. Aerial oil tracking resources must be capable of being on-scene (50 NM offshore) within 24 hours of the FOSC's decision to use dispersants.
4. WCD3: To qualify for the WCD3 classification, an OSRO must be able to apply 23,375 gallons of dispersants in a 12-hour window within 60 hours of the FOSC's decision to use dispersants. For WCD3, planners can estimate the dispersant application timeframe to begin at hour 48 and end at hour 60. To get credit for classification, all 23,375 gallons of dispersant must arrive at the OSRO selected primary staging site within 48 hours of the FOSC's decision to use dispersants. Aerial oil tracking resources must be capable of being on-scene (50 NM offshore) within 48 hours of the FOSC's decision to use dispersants.
5. WCD1, 2, and 3: To qualify for all Dispersant classifications, an OSRO must meet the total requirements for EDAC and response times as listed in Table 5-1 in Section D of this chapter.
6. Dispersant application requirements assume 12 hours of daylight in each tier period as a planning standard. For independent classifications, OSROs must be able to apply the EDAC for each tier within a 12-hour period.

D. Effective Daily Application Capacity

1. EDAC is the estimated amount of dispersant that can be applied to a discharge by an application system or multiple application systems, given the availability of supporting dispersant stockpiles. As per the regulations, EDAC is calculated for responding to a spill at the furthest 50 NM point offshore in the COTP zone from the staging or home airport. EDAC is evaluated by the following primary categories: aircraft and vessel delivery systems and payloads, the location (home base) of each identified platform, OSRO-selected primary staging airports, application pattern, and any other input parameters specified.
2. For dispersant application platforms not detailed in the EDSP, or for changes to listed values, adequacy of performance criteria must be documented by presentation of independent evaluation materials (33 CFR § 154.1045(i)(2)(ii)) and provided to the NSFCC. The EDAC requirements are listed in Table 5-1 below and can be found in 33 CFR § 154.1045(i), 33 CFR § 155.1050(k), and 33 CFR § 155.5050(j).

Table 5-1: Tiers for EDAC

Tiers	Response time for completed application (hours)	Dispersant application/Oil treated in gallons (Gulf Coast)	Dispersant application/Oil treated in gallons (All other U.S.)
Tier 1	12	8,250/165,000	4,125/82,500
Tier 2	36	23,375/467,000	23,375/467,000
Tier 3	60	23,375/467,000	23,375/467,000
Totals	60	55,000/1,100,000	50,875/1,017,500

3. For Tier 1, dispersant operations must commence at the site of a discharge within seven hours of the FOSC's decision to use dispersants. EDAC counted towards Tier 1 will be de-rated through the EDSP by completing the cascade information within the EDSP calculator. Aircraft and vessel platforms will observe 12-hour daytime operational periods during Tier 2 and Tier 3 dispersant operations.
4. Mobilization times for dispersant platforms are added in to EDAC calculations. For dispersant-applying aircraft, OSROs shall use the time specified in their contract with the aircraft to determine mobilization time. The OSRO must provide to the NSFCC a letter of attestation stating the times that the contracted aircraft can mobilize. Actual contracts must be available for review by the NSFCC during PAVs. For vessels, OSROs shall apply the times as listed in Table 5-2 in Section N of this chapter.
5. Aircraft which transit from their home location without dispersant application equipped and which must make a stop within the area of operations to fit equipment, refuel, or load dispersant payload must account for this time period during the EDAC calculation. If an aircraft deploys directly from its mobilization point and can dispense dispersants upon arrival on-scene, this additional equipment delay is not imputed.
6. If there are additional dispersant quantities that exceed a Tier's EDAC requirement, credit the excess dispersant quantities towards meeting the next Tier's EDAC requirements. For example, if an OSRO is trying to qualify for WCD2 and WCD3 classifications and can apply 30,000 gallons of dispersants to the site in 36 hours, then 23,375 gallons will go towards the WCD2 classification and the remaining 6,625 gallons will be applied towards the WCD3 classification.

E. Location and Documentation of Dispersant Resources

1. 33 CFR § 155.1035, 33 CFR § 155.5035, and 33 CFR § 154.1035 require that plans provide dispersant application platform, stockpile, and staging site locations. OSROs must enter these locations into the RRI. Furthermore, OSROs must maintain documentation that captures manufacturer-specific data, the type of dispersants at each stockpile and/or staging site location, and their shelf life and/or expiration date.

F. Captain of the Port Zones

1. The Coast Guard bases COTP zones and Marine Safety Unit (MSU) zones on the zones described in 33 CFR § 3.05-10 through 33 CFR § 3.85-15.

G. Travel Time

1. The standard speeds used for Dispersant classifications are the same as those used for Mechanical classifications for calculating travel time. Travel over water is calculated at 5 kts and travel over land is calculated at 35 mph as per 33 CFR § 154, Appendix C and 33 CFR § 155, Appendix B. The regulations use actual land and air routes and not a straight line between the staging and response locations.
2. Calculate aircraft speed for the transport of dispersant stockpiles at 100 kts, based on average speeds including delays, preparation time, and layovers. The EDSP designates aircraft speed used for calculating EDAC. If an OSRO adds a new aircraft to the EDSP, then an alternative speed request should be submitted to the NSFCC. With valid documentation, it is possible for an OSRO to request higher aircraft or vessel transit speeds for dispersant stockpile movement.

H. Dispersant Application Platform

1. Dispersant application platforms must be capable of delivering and applying dispersant on a discharge. At least 50% of each EDAC tier requirement must be achieved by fixed-wing aircraft application platforms.

I. American Society for Testing and Materials Standards

1. All dispersant application personnel must be trained in and capable of applying dispersants as outlined in ASTM F1413: “Standard Guide for Oil Spill Dispersant Application Equipment: Boom and Nozzle Systems” as per (i)(2)(iii).
2. Boom and nozzle dispersant application systems must be capable of applying dispersants in accordance with ASTM F1413.
    a. Minimum Equipment Performance Specifications, as per ASTM F1413 include:
        (1) Target Dosage: Dispersant spray equipment must provide a dispersant dosage between 2-10 gallons per acre. Five gallons per acre is the standard used for determining EDAC;
        (2) Droplet Size Distribution: The droplet size distribution of the dispersant reaching the target shall have a Volume Median Diameter (VMD) of 300-500µm; and
        (3) Maximum Delivery Variation over Swath Width: The equipment shall be capable of delivering dispersant with a maximum delivery variance of 10% over the swath width. Swath width is the length between the points at which the delivery drops below 90% of the design.
3. Document the adequacy of dispersant application systems not fully covered by ASTM F1413 by presenting independent evaluation materials (e.g., laboratory and field tests or reports of actual use). If an OSRO plans to use such a system, then the evaluation materials should be submitted to the NSFCC for evaluation.

4. NSFCC evaluates equipment for compliance with ASTM standards during the PAVs. OSROs must maintain manufacturer data on all dispersant spray equipment. If the manufacturer cannot supply the performance data, then the OSRO can perform independent testing of dispersant applicators; this testing should be done in accordance with ASTM F1738 when applicable. Documentation for performance data or equivalents should include:
    a. Performance data:
        (1) Droplet size: VMD;
        (2) Volumetric output distribution over the swath width;
        (3) A table of pump rates and dispersant injection rates or equivalent indices;
        (4) Nozzle design height for ship/boat systems;
        (5) Swath width;
        (6) Differential speeds for aircraft systems at various pump settings (or equivalents) and aircraft speeds; and
        (7) Recommended operating pressures at the inlet to the boom.
    b. Dosage chart: A chart of dosages achievable with different application vehicle speeds and different dispersant flow rates, boom pressures or other appropriate injection indicators.
5. OSROs must ensure routine maintenance is performed on all dispersant equipment. They should conduct calibration of oil spill dispersant application equipment per ASTM F1460 and testing of oil spill dispersant application equipment in accordance with ASTM F1738.

J. Aerial Oil Tracking and Application Capabilities for Dispersant Use

1. Per the VRP and FRP regulations—33 CFR § 155.1035, 33 CFR § 155.5035, and 33 CFR § 154.1035—plans must provide oil-tracking capabilities, and thus must identify a resource provider and the type and location of aerial surveillance aircraft that are ensured available through contract or other approved means. The aerial tracking resources must be capable of arriving at the site of a discharge in advance of the arrival of response resources identified in plans for WCD Tiers 1, 2, and 3 response times, and for a distance up to 50 NM from shore. Aircraft and personnel must be appropriately staged to meet the response time, number of aircraft pilots, and trained observation personnel requirements for supporting oil spill operations. This should commence upon initial assessment and aircraft and personnel must be capable of coordinating on-scene cleanup operations for dispersant operations. Observation personnel must be trained in the protocols of oil spill reporting and assessment and be familiar with the use of pertinent guides including, but not limited to, NOAA's *Open Water Oil Identification Job Aid for Aerial Observation* and the *Characteristic Coastal Habitats* guide.
2. As a planning standard for classification, aerial observation aircraft used for tracking the oil spill must be able to arrive at the site of the discharge (up to 50 NM offshore) within seven hours for Tier 1 WCD, 24 hours for Tier 2 WCD, and 48 hours for Tier 3 WCD.

3. Mobilization times are added to the calculated transit time from the home base to the primary staging site to determine the time of arrival on-scene. For oil tracking aircraft, mobilization times are listed in Table 5-2 under paragraph (M)(3) of this chapter.

4. OSROs shall provide the NSFCC with a list of their aerial oil tracking and application capabilities, to include: type of aircraft; aircraft transit speed; aircraft housing locations (address and latitude/longitude); mobilization times; and distances from the aircraft housing locations to the OSRO selected staging sites for each COTP zone.

K. Personnel

1. The number of personnel needed to support a response depends on numerous factors. OSROs seeking Dispersant classification shall ensure they have sufficient numbers of pilots, staging airport support and management personnel, and trained observation personnel to support aerial requirements.

2. OSROs must meet the personnel requirements for dispersant operations in 33 CFR § 154.1045(i)(2)(iv) and 33 CFR § 155.1050(k)(2)(iv). An OSRO must provide confirmation that personnel have received the proper training and are capable of applying dispersants according to the recommended procedures contained in ASTM 1737. PAV teams will review personnel training records and rosters to ensure compliance.

L. Response Times and Dispersant Stockpiles

1. In addition to dispersant resource quantities, OSROs are required to meet certain response times (33 CFR § 154.1045, 33 CFR § 155.5050, and 33 CFR § 155.1050). Dispersant application operations must commence within seven hours of the FOSC's approval to use dispersants. The dispersant provider has 12 hours to complete dispersant application for WCD Tier 1, 36 hours to complete dispersant application for WCD Tier 2, and 60 hours to complete dispersant application for WCD Tier 3. The amount that must be applied within the time frames is listed in 33 CFR § 154.1045(i) and 33 CFR § 155.1050(k).

2. Dispersant stockpiles are calculated within the RRI and arrival times are based on the distance from the stockpile location to the OSRO's selected primary staging location for an incident using the applicable transit speeds and routes. For WCD Tier 1, all required dispersants must arrive within seven hours of the FOSC's decision to use dispersants. For WCD Tier 2, 50% of the required dispersants (11,687 gallons) must arrive within 24 hours of the FOSC's decision to use dispersants and the remaining dispersants (11,688 gallons) must arrive within 30 hours. For WCD Tier 3, all required dispersants must arrive within 48 hours of the FOSC's decision to use dispersants.

3. Mobilization times for moving dispersant stockpiles are the same as oil tracking aircraft and are listed in Table 5-2 below.

Table 5-2: Resource Notification/Mobilization Response Times in Hours

Resource Status	Response Personnel Availability	
	On-Site	Recall
Owned/Dedicated	1	2
Contract or Dedicated	1.5	2.5
Owned/Non-dedicated	2.5	3.5
Contract/Non-dedicated	3	4

Note: Full-time personnel are a dedicated resource. Part-time personnel are a non-dedicated resource. On-site indicates a 24-hour staffed resource site, as opposed to personnel who have to be recalled.

M. Estimated Dispersant System Potential Calculations

1. The NSFCC requires that an OSRO records and maintains its EDSP calculations, as documentation, for each dispersant application resource for Tiers 1, 2, and 3 WCDs, and for each staging area within the COTP zone or ACC for which they are applying for classification.
2. OSROs should understand the requirements below to help facilitate the EDSP calculation process:
    a. The NSFCC requires an OSRO provide a screenshot of their EDSP calculations, as documentation, for each dispersant application resource for Tiers 1, 2, and 3 for each staging area within the COTP zone or ACC for which they are applying for a classification. Screenshots should display the mobilization time. If electronic means are not available then a hand-written mobilization time on the screenshot will suffice.
    b. Screenshots should be sent via email to the NSFCC at D05-SMB-NSFCC-RRI@uscg.mil.

CHAPTER 6. OSRO Classification Guidelines for Nonfloating Oils

A. Overview

1. Heavy oils and Group V oils, hereby merged and defined as nonfloating oils, exhibit qualities that could potentially cause the oils to submerge or sink, due to the oil characteristics, weathering, environmental factors, or how they are discharged. Examples of these types of oils include, but are not limited to, Diluted Bitumen (Dilbit), Group V Residual Fuel Oils, LAPIO (Low API Oil), Asphalt, and Asphalt Products. Regulations categorize certain Heavy oils within a different persistent oil grouping than Group V oils; however, due to the technical fact that environmental and geographic conditions can subject Heavy oils to submerge and sink, applicable plan holders and OSROs must be aware of and strongly consider the risk.
2. To capture the detection and response capabilities of OSROs more efficiently and enhance the response to nonfloating oils, the Coast Guard created the Nonfloating Oil classification. Previously, OSROs submitted Group V oil plans to the Coast Guard and, if deemed sufficient, would be listed as a Group V OSRO. The Group V OSRO classification is no longer valid. All OSROs seeking the Nonfloating oil classification must reapply through procedures outlined in this chapter.
3. OSROs that are already classified in the Mechanical classification program for a plan holder that handles, stores, or transports oils that are not Group V oils but that fall under the Heavy oil definition, should notify the NSFCC of their intention to classify as a Nonfloating Oil OSRO. An OSRO's current Mechanical classification will not be impacted. A Nonfloating Oil classification does not equate or supersede any other classification nor relieve the OSRO of any contractual responsibilities to their respective plan holders.
4. While this specific classification is focused on nonfloating oil spill response, the Coast Guard strongly emphasizes that oils with a higher specific gravity than 1.0 can still remain positively buoyant when discharged into the environment, given certain environmental conditions. While the Coast Guard is not requiring a certain type of Mechanical classification as a prerequisite to earn the Nonfloating Oil classification, the Nonfloating Oil classification has no bearing on the responsibility that each OSRO has to the plan holder for responding to what could become a positively buoyant or surface-oriented oil spill.
5. The underwater environment, poor visibility, and irregular behavior of nonfloating oils present significant response challenges to the oil spill response community in comparison to surface-oriented oil spills. Standard measures such as EDRC, and response techniques such as containment, have been proven to be inadequate and are difficult to apply for an oil spill where most of the oil is submerged below the surface or has sunk to the bottom, termed nonfloating oil. Therefore, to accommodate different ranges of technology and facilitate flexibility for each OSRO, the Coast Guard has created a detailed application for the Nonfloating Oil classification.
6. To earn a Nonfloating Oil classification, OSROs shall submit an application to the NSFCC requesting classification, along with nonfloating oil plan procedures. The NSFCC will ensure all proper documentation is included and will disseminate the plan to CG-MER. With assistance from subject matter expert reports (e.g., *the American Petroleum Institute's (API) Technical Report on Sunken Oil Detection and Recovery*), the NSFCC and CG-MER will then qualitatively

assess whether the OSRO has met the minimum level of safety and capability for the nonfloating oil classification. OSROs must demonstrate the capability to respond to all areas and conditions where nonfloating oil response operations may take place within the operating area and operating zone, and must demonstrate a level of equipment to work in a variety of water depths and conditions.

7. Upon delivery of the OSRO's Nonfloating Oil application to the NSFCC, the determination of the OSRO's Nonfloating Oil classification will occur no later than 60 days. This chapter provides further guidance to OSROs on how to apply for and attain the Nonfloating Oil classification and expectations of what information should be included in the Nonfloating Oil procedures.
8. The Nonfloating Oil classification meets the regulatory requirements of Group V oils in accordance with the criteria set forth by 33 CFR § 154.1047, 33 CFR § 155.1052, 33 CFR § 155.5052, and the OSRO classification guidelines.
    a. Plan holders who handle, store, or transport oils that are not Group V oils, but that fall under the nonfloating oil definition, are highly recommended to resource Nonfloating Oil OSROs in addition to OSROs already classified in the Mechanical classification program. Plan holders that handle, store, or transport oils that are Group V oils shall utilize Nonfloating Oil OSROs. The Coast Guard's classification program no longer recognizes the Group V OSRO listing, which was removed from the RRI.
9. OSROs should be aware of the types of oil that their plan holder's vessel or facility handles, stores, or transports, as each type of oil presents unique response challenges. Overall, this document and chapter emphasize the vital role that the COTP and the NSFCC/CG-MER maintain in oversight and examination of an OSRO's nonfloating oil response capabilities, planning, and execution. Guidance is provided to assist with the following field responsibilities:
    a. Conducting a review of the nonfloating oil application and procedures;
        a. Using GIUEs to evaluate Nonfloating Oil OSRO response capabilities;
        b. Employing existing field activities to validate overall nonfloating oil response capabilities.

B. Nonfloating Oils Classification Evaluation

1. The Coast Guard will evaluate equipment that is owned or contracted and used to respond to nonfloating oil spills based on its suitability and ability to respond to nonfloating oils.
2. Government and industry plan holders are responsible for screening OSROs to ensure they meet the planning standards for specific operating locations. Specifically, government and industry plan holders should compare the environments and depths in which they operate with the Nonfloating Oil OSROs' capabilities (and what depth they extend to).
    a. **Nonfloating Oil PAVs**: Upon concurrence of an OSRO's Nonfloating Oil application, the NSFCC will coordinate a PAV to verify certain or all capabilities. With respect towards mitigating excessive costs for the OSRO, the assessment may include testing certain equipment, training verification, and an audit of the OSRO's documentation with

contractors. PAVs will be conducted in accordance with NSFCC, cognizant COTP's frequency posture, and CG-MER policy.

3. The following are fundamental expectations for the NSFCC and CG-MER evaluation of an OSRO's Nonfloating Oil Procedure:

    a. Do they possess appropriate detection capabilities such as sonar, sampling equipment, or other methods for locating the petroleum oil on the bottom or suspended in the water column? The equipment must be sufficient to address a range of depths and bottom types.

        a. Do they possess appropriate recovery capabilities such as dredges, pumps, or other equipment necessary to recover petroleum oil from the bottom and shoreline?

        b. Do they possess appropriate equipment and processes necessary to assess the environmental impact of nonfloating oil discharges? Examples include detection equipment listed in Section (B)(1)(a) and Section (C) of this chapter and trained response personnel.

        c. Do they possess other appropriate equipment necessary to respond to a discharge involving the type of petroleum oil handled, stored, or transported?

        d. Is the equipment suitable for intended geographic of operations (e.g., restricted visibility, inland rivers, ice conditions in Alaska)?

        e. Are there any records of the OSROs past performance that should be taken into consideration?

C. Application for Nonfloating Oils Classification

1. To earn a Nonfloating Oil classification, OSROs shall send their application electronically (preferred) or by mail to the NSFCC using procedures listed in Chapter 1 (A) of these guidelines.

2. The application shall include the following information:

    a. OSRO Name;

        a. Address;

        b. Points of Contact;

        c. Basic Ordering Agreement Number (If applicable);

        d. The COTP zones or ACCs you intend to operate (if known):

        (1) The estimated deployment time for the detection and recovery assets for each location; and

        (2) [**Note**] In COTP zones or ACCs, resources must deploy within 24 hours for vessel response plans; for facility response plans, resources must be on site within 24 hours;

        e. The maximum depth or range of the OSRO's detection and recovery assets (List the lesser of the two, if different);

        f. Inventory list (Specify whether resources are dedicated or non-dedicated);

        g. Any contracts associated with nonfloating response assets;

h. Maximum capacity of fixed/temporary storage;

i. Location of fixed/temporary storage;

j. Training documentation, logs, records and/or professional certificates for all nonfloating oil spill response personnel (includes contracted response personnel such as divers);

k. General Logistics Narrative. The Coast Guard does not expect a logistics narrative for every COTP zone or ACC, but rather a universal logistics narrative. A logistics narrative should include, but not be limited to:

(1) Methods of personnel recall (if applicable);

(2) Methods of loading resources for mobilization;

(3) Methods of resource transport off-site to incident or staging;

(4) Methods of mobilizing, deploying and supporting resources;

(5) Special response resources staging (e.g., prepackaging, palletizing, preloading); and

(6) Necessary site support services (e.g., tractors, trailers, drivers, cranes);

l. Nonfloating Oil Procedures (reference Section D of this chapter).

3. A nonfloating oil application shall be submitted to the NSFCC prior to any entries into RRI. Doing so ensures that the NSFCC and CG-MER have time to review the application and confirm that the OSRO has met the minimum requirements to satisfy the regulations and challenges faced during a nonfloating oil discharge. After a successful submission and upon notification from the NSFCC, OSROs shall input their resources into the appropriate nonfloating oil categories in the RRI and ensure that the resource information is accurate to maintain classification and to service plan holders.

D. Nonfloating Oil Procedures and Core Equipment Standards

1. While each segment within the Nonfloating Oil classification application will increase the level of preparedness for the Coast Guard, OSROs, and plan holders, the nonfloating oil procedures are the heart of the application. 33 CFR § 154.1047(a)(1), 33 CFR § 155.1052(a)(1), and 33 CFR § 155.5052 state that plan holders must identify procedures and strategies for responding to a WCD of Group V petroleum oils to the maximum extent practicable.

2. In effect, the nonfloating oil procedures are an opportunity for the OSRO to present its concept of operations to the Coast Guard for nonfloating oil spills. Given the range of densities and properties of nonfloating oils, and the environments in which they are handled, stored, or transported, it is understood that response operations will be unique to the type of event; therefore, a prescriptive model is not expected within the plan. However, to establish a baseline model, the Coast Guard has established core resources and considerations, in alignment with the intent of 33 CFR § 154.1047 and 33 CFR § 155.1052, for the OSRO to connect its inventory, personnel, and contractual assets and elaborate on their capability to respond to nonfloating oil spills.

3. The regulations separate core resources and considerations into four categories: (I) Detection Capabilities, (II) Recovery Capabilities, (III) Storage Capabilities, and (IV) Environmental

Conditions and Operating Areas. A fifth optional category, (V) Containment, can be added to the nonfloating oil procedures if, whether through best practices or new technology, the OSRO deems it a necessary aspect of their operations. OSROs are encouraged to have all of their nonfloating oil related equipment listed within this section under each core resource. At the minimum, each OSRO should include the following within their nonfloating procedures.

a. **Detection Capabilities**: The timing of a nonfloating oil survey is essential to success in detection of nonfloating oil, because once the oil remobilizes; detection with any relative success becomes more difficult with passing time. OSROs shall identify equipment and methods used for locating the product on the bottom or suspended in the water column, and identify equipment necessary to assess the impact of such discharges. OSROs should include the depth to which these capabilities extend and what limitations may exist. OSROs should state how these capabilities complement their procedures and strategies for responding to a WCD of nonfloating oils to the maximum extent practicable. OSROs shall ensure that all strategies and capabilities follow industry standards and comply with local, state, and federal laws (e.g., contracted diver OSROs will comply with OSHA and Coast Guard regulations).

   (1) Examples of Detection Capabilities.

      (a) **Sonar systems**. Examples of capabilities include the side scan sonar, multi-beam echo sounder, sub bottom profiler, and 3D scanning sonar.

      (b) **Underwater visualization systems including cameras and video**. Examples of capabilities include cameras with resolutions of >15 megapixels, sediment profile imaging (SPI) cameras, and acoustic cameras.

      (c) **Diver observations**. OSROs should familiar with *API Technical Report 1154-1: Sunken Oil Detection and Recovery*. Specifically, section 6.0, titled “Diving in Contaminated Water,” should be referenced to protect the safety and health of the divers assigned to complete this work. OSROs shall specifically state the diving capabilities such as surface-supplied, mixed gas, saturation systems, one-atmosphere suits, or submersibles.

      (d) **Towed or stationary sorbents**. Examples of capabilities include sorbents attached to chains that are dragged on the bottom and sorbents suspended in the water column or placed in cages.

      (e) **Laser fluorosensors**. The unit is towed close to the bottom.

      (f) **Visual observations by trained observers**. Trained observers can be rapidly deployed and record vital data about nonfloating oil, as long as the oil is visible to the observer. Preferred capabilities are water surface and aerial observations.

      (g) **Bottom sampling**. Examples of capabilities include sediment grab, core samplers, wading-depth shovel pits, and agitation methods.

      (h) **Water sampling in-situ analysis**. Examples include fluorometers and mass spectrometers that are towed in the water column.

a. **Recovery Capabilities**: OSROs shall identify equipment and methods used to recover the product from the bottom and shoreline. OSROs should include the depth to which these capabilities extend and what limitations may exist. OSROs should state how these capabilities complement their procedures and strategies for responding to a WCD of nonfloating oils to the maximum extent practicable. OSROs shall ensure that all strategies and capabilities follow industry standards and comply with local, state, and federal laws (e.g., contracted diver OSROs will comply with OSHA and Coast Guard regulations).

(1) Examples of Recovery Capabilities.

(a) **Suction Dredge**. Dredging through use of hydraulic pumps to remove and transport the oil, oiled sediments, and oiled debris.

(b) **Diver-directed pumping and vacuuming**. Pumping capabilities refer to the use of a centrifugal or positive-displacement type pump at or below the water surface with a diver-directed suction hose. Vacuuming refers to a vacuum truck or unit above the water surface, either on shore or on a vessel/barge that creates a vacuum, with divers directing the hose attached to the vacuum. OSROs should be familiar with API *Technical Report 1154-1: Sunken Oil Detection and Recovery*. Specifically, section 6.0, titled "Diving in Contaminated Water," should be referenced to protect the safety and health of the divers assigned to complete this work.

(c) **Mechanical removal**. Examples of capabilities include excavators, clamshell dredges, environmental dredge buckets, or other machinery used to grab, scoop, or pick up sunken oil, oiled sediments, and oiled debris.

(d) **Sorbent/V-SORs**. Sorbents attached to chains that are dragged on the bottom to recover liquid oil.

(e) **Trawls and nets**. These are towed in the water column or on the bottom to recover viscous oil.

(f) **Manual removal**. Physical removal of viscous oil using hand tools, either by wading in shallow water or by divers in deeper water.

(g) **Agitation/refloat**. Agitation of oil on the bottom to get the oil to float to the surface for recovery.

b. **Storage Capabilities**: While fixed and temporary storage capabilities are not prescriptively listed in 33 CFR § 154.1047, 33 CFR § 155.1052, or 33 CFR § 155.5052, the regulations do require plan holders to identify appropriate equipment necessary to respond to a discharge. Storage resources are essential aspects of a response and fall within the intent of 33 CFR § 154.1047(c)(5) and 33 CFR § 155.1052(c)(4). Therefore, OSROs shall identify storage resources and methods used to store the recovered product. OSROs should state how these capabilities complement their procedures and strategies for responding to a WCD of nonfloating oils to the maximum extent practicable. OSROs shall ensure all strategies and capabilities follow industry standards and comply with local, state, and federal laws.

c. **Environmental Conditions and Operating Areas**: In accordance with 33 CFR § 154.1047(b) and 33 CFR § 155.1052(b), OSROs shall include a general description of the operating area (water depth included) to which their capabilities can extend and the environmental conditions in which their capabilities can operate without limitation. As OSROs may operate within multiple COTP zones or ACCs, only a general description is expected. OSROs should include any additional equipment that is critical to their nonfloating oil spill response during certain environmental conditions, such as specialized heating apparatuses during colder weather. OSROs should include methods used to mitigate the additional risks that each operating area and its environment, including seasonal conditions, may pose.

(1) Examples of Environmental Conditions and Operating Areas:

(a) Ice conditions;

(b) Debris;

(c) Temperature ranges;

(d) Weather and seasonal conditions; and

(e) Water salinity and visibility.

d. **(Optional) Containment**: OSROs may identify equipment and methods used for containing the product that may remain floating on the surface or to reduce spreading on the bottom. OSROs should include the depth to which these capabilities extend and what limitations may exist. OSROs should state how these capabilities complement their procedures and strategies for responding to a WCD of nonfloating oils to the maximum extent practicable. OSROs shall ensure all strategies and capabilities follow industry standards and comply with local, state, and federal laws (e.g., contracted diver OSROs will comply with OSHA and Coast Guard regulations).

(1) Examples of Containment Capabilities:

(a) Nets or curtains attached to the bottom and/or suspended from the surface;

(b) Physical barriers such as artificial depressions (e.g., trenching);

(c) Bottom boom;

(d) Sheet piling;

(e) Bubble curtain; and

(f) Sorbents in filter fences or cages.

E. Resource Requirements

1. To be classified as a nonfloating oil-capable OSRO, the OSRO must be able to demonstrate the minimum requirements listed in Section D of this chapter.

2. The number of personnel needed to support a response depends on numerous factors. For the OSRO classification program, the number of personnel required for a classification for each COTP zone or ACC is based on the location of resources. During the application process,

through the NSFCC and/or RRI, an OSRO will identify the number of personnel required to mobilize and operate the resources at each of its resource sites for a nonfloating oil discharge. Each site that meets the time requirements for a classification should have its personnel requirements totaled for that classification. If the OSRO has identified sufficient personnel to meet the response time requirements and concurrently can deploy and operate all equipment necessary for that level of classification, then an OSRO qualifies for that classification.

3. Resources counted for OSRO classification can be owned or contracted. All contracted assets must have a letter of agreement (LOA) between the OSRO and the contracting company on file at the NSFCC. FRP and VRP regulations require plan holders to ensure the availability of response resources by contract or other approved means. OSROs must meet these same requirements for all response resources (dedicated, non-dedicated, owned, and non-owned equipment and personnel) that they claim for classification purposes. All contracted equipment shall be listed in the RRI by the resource owner prior to an OSRO listing a resource as contracted.

APPENDIX A. List of Acronyms

AAR	After Action Report
ACC	Alternate Classification City
ACP	Area Contingency Plan
AMPD	Average Most Probable Discharge
AOR	Area of Responsibility
APC	Alternative Planning Criteria
API	American Petroleum Institute
ASTM	American Society for Testing and Materials
bbl	Barrel; unit of volume
BSEE	Bureau of Safety and Environmental Enforcement
CDL	Commercial Driver's License
CFR	Code of Federal Regulations
CG-CVC	Coast Guard Office of Commercial Vessel Compliance
CG-MER	Coast Guard Office of Marine Environmental Response Policy
COTP	Captain of the Port
CPFR	Contingency Planning and Force Readiness
DOR	Dispersant-to-Oil Ratio
DRAT	District Response Advisory Team
Dilbit	Diluted Bitumen
EDAC	Effective Daily Application Capacity
EDRC	Effective Daily Recovery Capacity
EDSP	Estimated Dispersant System Potential Calculator

EEZ	Exclusive Economic Zone
EPA	Environmental Protection Agency
ERSP	Estimated Recovery System Potential
EV	Equipment Verification
FAA	Federal Aviation Administration
FI	Facility Inspector
FOSC	Federal On-Scene Coordinator
FRP	Facility Response Plan
FWPCA	Federal Water Pollution Control Act
GIUE	Government-Initiated Unannounced Exercise
HAZWOPER	Hazardous Waste Operations and Emergency Response
HVPA	Higher Volume Port Area
IMD	Incident Management Division
kts	Knots; unit of speed
LAPIO	Low API Oil
LOA	Letter of Agreement
lbs	Pounds
MMPD	Maximum Most Probable Discharge
mph	Miles Per Hour; unit of speed
MSU	Marine Safety Unit
NCP	National Oil and Hazardous Substances Pollution Contingency Plan
NM	Nautical Miles
NOAA	National Oceanic and Atmospheric Administration

NSF	National Strike Force
NSFCC	National Strike Force Coordination Center
OGA	Other Government Agency
OPA 90	Oil Pollution Act of 1990
OSHA	Occupational Safety and Health Administration
OSRO	Oil Spill Removal Organization
OSRV	Oil Spill Response Vessel
PAV	Preparedness Assessment Visit
PHMSA	Pipeline and Hazardous Materials Safety Administration
PREP	Preparedness for Response Exercise Program
RCP	Regional Contingency Plan
RRI	Response Resource Inventory
RRT	Regional Response Team
SPI	Sediment Profile Imaging
TSC	Temporary Storage Capacity
VMD	Volume Median Diameter
VRP	Vessel Response Plan
WCD	Worst Case Discharge

APPENDIX B. Glossary Terms

Adverse Weather	The weather conditions that will be considered when identifying response systems and equipment in a response plan for the applicable operating environment. Factors to consider include, but are not limited to, significant wave height, ice, temperature, weather-related visibility and currents within the COTP zone in which the systems or equipment are intended to function.
Alternate Classification City (ACC)	A designated geographic location along the U.S. coastline used in addition to or in lieu of a COTP zone for an OSRO classification.
Area Contingency Plan (ACP)	The plan prepared by an Area Committee that is developed to be implemented in conjunction with the NCP and RCP, in part to address removal of a WCD and to mitigate or prevent a substantial threat of such a discharge from a vessel, offshore facility or onshore facility operating in or near an area designated by the President of the United States.
Alternative Planning Criteria	Planning criteria approved by the Coast Guard when a planholder believes that national planning criteria in 33 CFR § 154, 155 are inappropriate for the areas in which the vessel intends to operate.
Captain of the Port (COTP) Zone	A zone specified in 33 CFR § 3 and, for coastal ports, the seaward extension of that zone to the outer boundary of the exclusive economic zone (EEZ).
Classification	A process for identifying OSRO capability within geographic locations on the basis of its ownership and/or control of specialized equipment and trained personnel used in the removal of oil from the area.
Containment Boom	Boom that is used to collect and hold oil on the surface of the water for recovery by skimmers or similar collection devices. The regulations require containment boom equal to 1,000 feet or twice the length of the largest vessel served, plus sufficient boom for the efficient operation of recovery devices. For classification, an OSRO is expected to have 1,000 feet of containment boom for each operating area in which it operates, plus 300 feet of containment boom for each recovery system used in its classification.

Contract	(1)A written contractual agreement between a vessel owner or operator and an oil spill removal organization. The agreement must identify and ensure the availability of specified personnel and equipment required under this subpart within stipulated response times in the specified geographic areas; (2) Certification by the vessel owner or operator that specified personnel and equipment required under this subpart are owned, operated, or under the direct control of the vessel owner or operator, and are available within stipulated response times in the specified geographic areas; (3) Active membership in a local or regional oil spill removal organization that has identified specified personnel and equipment required under this subpart that are available to respond to a discharge within stipulated response times in the specified geographic areas;
Dedicated Response Resources	Equipment and personnel dedicated primarily to oil spill response, cleanup and spill containment. Such equipment and personnel are not utilized for any other activity that would adversely affect their ability to provide oil spill response services.
Dispersant Application Platform	Vessels and aircraft outfitted with dispersant-application equipment acting as the delivery system for the dispersant onto the oil spill.
Dispersant	Chemical agents that emulsify, disperse or solubilize oil into the water column or promote the surface spreading of oil slicks to facilitate dispersal of the oil into the water column. Those products of a type that are listed NCP (40 CFR § 300), maintained by EPA.
Effective Daily Application Capacity (EDAC)	The estimated amount of dispersant that can be applied to a discharge by an application system given the availability of supporting dispersant stockpiles.
Estimated Dispersant System Potential Calculator (EDSP)	The Estimated Dispersant System Potential Calculator is a tool for OSROs seeking Dispersant classification. Regulations delineate the Planner requirements. The Planner uses dispersant-related input from the OSROs to evaluate and identify sufficient and appropriately trained personnel, vessels, delivery systems, dispersants and any other input parameters specified in the calculator. These values help the NSFCC with determining the Dispersant classification level of the OSRO.
Great Lakes	Operating area that includes Lakes Superior, Michigan, Huron, Erie and Ontario; their connecting and tributary waters; the Saint Lawrence River as far as Saint Regis; and adjacent port areas.
Gulf Coast Region	The region encompassing the following COTP zones: Corpus Christi, TX; Houston/Galveston, TX; Port Arthur, TX; Morgan City, LA; New Orleans, LA; Mobile, AL; and St. Petersburg, FL.

Heavy Oils	Includes all liquid petroleum products, whether refined, unrefined, diluted or weathered, which, at any point of its fate, possess an API gravity equal to or less than 20˚. This definition includes Dense Nonaqueous Phase Liquids (DNAPL), Diluted Bitumen (Dilbit), LAPIO (Low API Oil), Asphalt and Asphalt Products.
Higher Volume Port Areas (HVPA)	Ports listed in 33 CFR § 154.1020 and 33 CFR § 155.1020, including any water area within 50 NM seaward of the port.
Inland Area	The area shoreward of the boundary lines defined in 46 CFR part 7, except that in the Gulf of Mexico, it means the area shoreward of the lines of demarcation (COLREG lines) as defined in 33 CFR §§80.740 through 80.850. The inland area does not include the Great Lakes.
Maximum Most Probably Discharge (MMPD)	For a facility, a discharge of 1,200 barrels or 10% of the volume of a WCD, the lesser number. For a tank vessel with a capacity equal to or greater than 25,000 barrels of oil, a discharge of 2,500 barrels. For a tank vessel with a capacity of less than 25,000 barrels, a discharge of 10% of the tank vessel's oil cargo capacity.
Mobilization	The time it takes to get the resources assembled and prepared at the staging site. Mobilization begins when notification ends and ends when the resources are ready to move off-site.
Near Shore	The area extending seaward 12 NM from the boundary lines (except in the Gulf of Mexico) defined in 46 CFR § 7. In the Gulf of Mexico, it means the area extending seaward 12 NM from the line of demarcation (COLREG lines) as defined in Sections 80.740–80.850 of 33 CFR § Chapter I.
Non-dedicated Response Resources	Response resources with service that is not limited exclusively to oil or hazardous substance spill response-related activities.
Nonfloating Oils	All **Heavy oils** and **Group V oils** that have the propensity to move below the sea surface either because of their initial densities or because the changes in their densities as a result of weathering or interaction with sediments. Nonfloating oils may be below the water surface, suspended in the water column or deposited on the seabed.
Nonfloating Oil Plan	A comprehensive plan, owned by the OSRO, which outlines the characteristics of the OSRO's resources and capabilities for nonfloating oil spills in relation with the classification's core standards.
Non-persistent or Group I Oil	A petroleum-based oil that, at the time of shipment, consists of hydrocarbon fractions, at least 50% of which by volume distills at a temperature of 340°C (645°F) and 95% of which by volume distills at a temperature of 370°C (700°F).

Ocean	The near shore, offshore and open ocean operating areas as defined in these guidelines.
Offshore	The operating area up to 38 NM seaward of the outer boundary of the near shore area.
Oil Spill Removal Organization (OSRO)	An entity that provides oil spill response resources
Open Ocean	The area from 38 nautical miles seaward of the outer boundary of the nearshore area, to the seaward boundary of the exclusive economic zone (EEZ).
Operating Area	Rivers/canals, Great Lakes, inland, near shore, offshore or open ocean. These terms are used to define the geographic location(s) in which a facility or tank vessel is handling, storing or transporting oil.
Operating Environment	Rivers/canals, Great Lakes, inland, or ocean. These terms are used to define the conditions in which response equipment is designed to function.
Other Approved Means	For the purposes of these guidelines, means a Letter of Intent as defined in this Glossary.
Owned Resources	Equipment that belongs solely to the OSRO or personnel directly employed by the OSRO submitting an application for classification.
Preparedness Assessment Visit (PAV)	PAVs are a critical component of the oil spill response preparedness system, providing on-site verification of resources and their condition.
Persistent Oil	A petroleum based oil that does not meet the distillation criteria for non-persistent oil. For the purposes of these guidelines, persistent oils are further classified based on specific gravity as follows: **Group II**: Specific gravity less than 0.85 **Group III:** Specific gravity between 0.85 and less than 0.95 **Group IV**: Specific gravity equal to or greater than 0.95 and less than 1.0 **Group V:** Specific gravity equal to or greater than 1.0
Pre-authorization	Means an agreement, adopted by an RRT or Area Committee, which authorizes the use of dispersants at the discretion of the FOSC without the further approval of other federal or state authorities. These pre-authorization areas are generally limited to particular geographic areas within each region.
Primary Staging Site	Means a site designated within a COTP Zone that has been identified as a forward staging area for dispersant application platforms and the loading of dispersant stockpiles. Primary staging sites are typically the planned locations where platforms load or reload dispersants before departing for application at the site of the discharge and may not be the locations where dispersant stockpiles are stored or application platforms are home-based.

Protective Boom	Boom used for deflecting/diverting or otherwise influencing oil on the water surface away from sensitive environments, often but not always toward containment sites.
Resource Site	A location where personnel and pollution response equipment are staged.
Response Resource Inventory (RRI)	The database of oil spill response resources developed by the Coast Guard to meet requirements of OPA 90.
Response Resources	The personnel, equipment, supplies and other capabilities necessary to perform the response activities identified in an FRP or VRP.
Rivers/Canals	Operating area that includes bodies of water confined within the inland area, including the Intracoastal Waterways and other waterways artificially created for navigation, that have a project depth of 12 feet or less.
Skimming Systems	Devices used to remove spilled oil from the surface of the water through means of mechanical suction, adhesion, absorption, adsorption or some similar mechanism of action that allows separation and recovery of spilled oil from the water's surface. Skimmers may be self-propelled, towed or pushed through the water.
Temporary Storage Capacity (TSC)	Inflatable bladders, rubber barges, certificated barge capacity or other temporary storage that is capable of being utilized on-scene at a spill response and is designed and intended for storage of flammable or combustible liquids. It does not include tank vessels or barges-of-opportunity for which no prearrangements have been made. Fixed shore-based storage capacity, ensured available by contract or other approved means, is acceptable in limited circumstances.
Tiers 1, 2 and 3 Worst Case Discharge Classifications	The combination of response resources and the times within which the resources must be capable of arriving on-scene to meet WCD resource requirements as defined in 33 CFR § 154.1020 and 33 CFR § 155.1025.
Worst Cast Discharge (WCD)	As defined by 33 U.S.C. § 1321, means, "in the case of a vessel, a discharge in adverse weather conditions of its entire cargo" and, "in the case of an offshore facility or onshore facility, the largest foreseeable discharge in adverse weather conditions."

Annex OO

Hazardous Substance

Hazardous Substance Incident Annex – Sector Delaware Bay

Introduction

[Link to the Oil and Hazardous Materials Incident Annex in the NRF]

In accordance with the National Response Plan and the Comprehensive Environmental Response, Compensation and Liability Act (CERCLA) the Coast Guard will serve as the Federal On-scene Coordinator (FOSC) for actual or potential releases of hazardous substances[1] within the coastal zone that would:

- Impact public health and safety AND
- Enter the environment and originate from:
  - Vessels or facilities [2]

Purpose

This Annex is written to provide initial response guidance upon notification of a hazardous substance release in the coastal zone which may have actual, potential, or perceived consequences to public health or the environment.

If the hazardous substance release is suspected or confirmed to be the result of a terrorist act, response to the incident should be initiated using this Annex, the Terrorism Incident Annex and the Area Maritime Security Plan.

Jurisdiction

The Coast Guard is the Federal On-scene Coordinator for any hazardous substance releases in the coastal zone that require emergency removal actions with the exception of incidents that:

- Occur from vessels or facilities owned, operated, or controlled by the Department of Defense (DOD) or Department of Energy (DOE)
- Are *non-emergency* removal actions of hazardous substance releases from vessels or facilities owned, operated, or controlled by Federal agencies *other than* the DOD or DOE

[1] The term hazardous substance is defined in CERCLA § 101. A list of hazardous substances can be found in 40 CFR 302.4

[2] The term *facility,* as defined under CERCLA Section 101(9), encompasses virtually any entity except vessels "where a hazardous substance has been deposited, stored, disposed of, or placed, or otherwise came to be located." This includes buildings, shipping containers, drums, vehicles, aircraft and drainage ditches. If hazardous substances were released from a vessel and sank to the bottom of the Delaware River, the vessel would not be considered a *facility*, but the affected area of the river bottom where the hazardous substance has accumulated would be considered as such.

Under the CERCLA the Coast Guard Incident Commander (acting under their FOSC authority) has the authority to:

- Initiate a time critical assessment of the threat
- Take the necessary steps to stabilize or control the immediately identified potential threat
- Begin activating Federal scientific support agencies necessary to conduct an assessment (air, water, soil, or specific substance sampling in accordance with the relevant published sampling protocols and guidelines)
- Initiate a response

Coast Guard Incident Commander Considerations

In most hazardous substance cases the On-scene Incident Commander will be from the local fire department or other local, county, or state agency. The Coast Guard Incident Commander's role is to:

- Determine if the incident requires the initiation of the Critical Incident Communications procedures [Link to Critical Incident Communications Procedures Section 1050]

- Determine if the response is being managed by appropriate local authorities in a timely manner (fire departments are normally lead agencies) and assess their need for Federal assistance.

If the response is being managed properly, provide Federal support as necessary to the On-scene Incident Commander through:

- Opening the CERCLA fund
- Activating Basic Ordering Agreements with contractors
- Providing technical support
- Deploying Coast Guard resources as needed (Atlantic Strike Team, vessels or aircraft)

If the response is not being managed properly by the Responsible Party[3] or is not managed in a timely manner, one of the following orders may be issued:

- An Administrative Order issued under CERCLA for "hazardous substance" releases when the FOSC has determined that there may be an imminent and substantial endangerment to the public health and welfare or the environment. The FOSC must be reasonably certain that the party to whom the Administrative Order is issued is in fact

[3] The owner and/or operator of a vessel or a facility. See 42 USC CH 103 Sec. 9607

the responsible party.[Example of a CERCLA Admin Order Section 9763]

- Captain of the Port Order[4] issued to insure the safety of vessels and waterfront facilities, and the protection of the navigable waters and the resources therein.

In the event that the Responsible Party:

- Cannot be identified, located, or contacted in a timely manner, or
- Is either unwilling or unable to take responsibility and initiate removal actions, or
- Is conducting removal actions which are inadequate, unsafe, and/or pose a hazard to public health and/or the environment, or
- Other agencies have not responded or are not available

Then: Commander Sector Delaware Bay will determine whether to federalize the removal actions. If federalized, the following actions should be taken:

- Engage in a coordinated and prompt response (The general rule for CERCLA is "First make it safe, then determine the extent of the hazard and Federal removal authorities")
- Contact the appropriate state agency
  - New Jersey Department of Environmental Protection
  - Pennsylvania Emergency Management Agency
  - Delaware Department of Natural Resources and Environmental Control
- Contact local/state authorities to secure the scene and establish exclusion zones
- Access CERCLA funding
- Consult the Base Plan Section 2000 for further Incident Commander actions [Link to Initial Considerations and Decisions of the Incident Commander/Unified Command Section 2000]
- Conduct a removal site assessment to include:
  - Identification of the source
  - Determination of the threat to public health (resources that can assist with this determination include)
    - Agency for Toxic Substance Disease Registry (ATSDR)
    - Local, County or State public health officials
  - Evaluation of the magnitude of the threat
  - Determination if actions have been taken to mitigate the release
  - Determination if there is potential of further release
- Designate the Potentially Responsible Party(s)
- Determine when removal actions are complete
- If the site requires continued cleanup under the remediation phase, AND IS NOT A VESSEL, transfer the role of OSC to EPA Region II or III as appropriate.

[4] See 33 CFR 160.101-109

Circumstances where the Coast Guard can Transfer OSC to the EPA

[Link to Guidance for Transitioning On-scene Coordinator from the Coast Guard to the EPA Section 9760]

The most common circumstances under which the Coast Guard OSC would transfer OSC responsibilities to the EPA for action are when:

- The release originates from a Hazardous Waste Management Facility.
- The release does not require an immediate removal action
- The site assessment determines that:
  - The release does not require immediate removal actions
  - Remedial actions are necessary to complete the cleanup
- The threat of further release has been eliminated, prior to the completion of the cleanup.
- Coast Guard policy requires that removal be secured when prompt action is no longer necessary and substantial remediation methods must be used to completely remove the remaining contamination.

When requesting a transfer of the OSC authority a "Statement of Agreement Transferring Federal On-Scene Coordinator Responsibility" shall document the transfer of authority. [Link to sample Statement Section 9761]

Under normal circumstances, the CG will not transfer OSC authority to the EPA whenever the source of a release is a vessel.

Notification

If the Coast Guard is receiving the initial notification:

- The information will be recorded in Sector Delaware Bay's Hazmat Incident Response Form [Link to Form Section 9762]
- Notify Tri-State Maritime Safety Association
- Contact the National Response Center (NRC)
- Contact appropriate local communications centers to activate local notification protocols

Dispatching Initial Coast Guard Response Personnel

Safety is *always* the *primary consideration* when the determination is made to dispatch response personnel.

Prior to dispatching personnel ensure that the following are completed:

- Obtain information on the hazardous substance (consider the following potential sources of information)
  - Responsible Party (RP)
  - Reference material sources (list not inclusive):

- CHRIS Manuals COMDINST 16465.12
- Material Safety Data Sheet (MSDS)
  - Supplied by PRP
  - Website http://www.cdc.gov/niosh/npg
- Department of Transportation' s Emergency Response Guidebook
- NIOSH Pocket Guide
- Atlantic Strike Team

- Collect existing and forecast environmental conditions (wind direction, speed, precipitation, temperature, inversions, etc)
- Determine nature of safety risk to responders consistent with environmental conditions. For example:
  - Inhalation hazards are directly related to wind conditions & inversions
  - Some chemicals, such as concentrated acids, react violently with water
  - Vapor pressure and off-gassing increase with temperature
- Determine, if established, the location of the Incident Command Post (ICP)
  - If there is no ICP established, contact appropriate local authorities to isolate the hazard and establish a safely located ICP
  - If locals are unable to isolate and/or control the hazardous substance release contact the Atlantic Strike Team to make entry and determine the exclusion, contamination reduction zone, and safe zone
- Get directions to the ICP that provide a safe approach to prevent inadvertent entry into a contaminated area – and check the approach against your own assessment of wind direction/speed.
- Conduct an operational risk assessment to evaluate safety concerns using either:
  - Green/Amber/Red (GAR) Model [Link to GAR form Section 9707]
  - Operational Hazard Work Sheet
    - [Link to ICS Compatible Site Safety Plan Section 9708]
    - [Link to Specific Hazard Attachments Section 9709]
- Ensure appropriate protective equipment is available
  - Emergency Escape Breathing Apparatus (EEBA)
  - Appropriate respirator and cartridge
  - Toxi-clip
  - Oxygen meter

Actions upon Arriving On-scene

- Meet with the On-scene Incident Commander at the Incident Command Post
- Determine the extent of the emergency (hazards) and actions taken to mitigate
- Determine with IC any need for Federal assistance
- Meet with PRP representative on scene and determine willingness to conduct removal actions on behalf of FOSC
- Obtain and record the following information on the unit's Hazmat Incident Response Form
  - Information on site security and control

- Availability of Emergency Response Plan
- Availability of Site Safety Plan
- Available and/or on scene Hazardous Materials response teams
- Appropriate use of personal protective equipment
- Air monitoring procedures
- Cleanup and disposal procedures

For all Federalized Removal Actions (at a facility or on a vessel)

The Unified Command should consider the following priorities, objectives and determinations when responding to a hazardous substance release.

Unified Command Priorities

- Responder safety
- Rescue of victims of the incident
- Source Control / Incident Stabilization
- Public safety and hazard mitigation
  - Protection from direct exposure, possible evacuations (evacuation determinations are generally a local government decision)
  - Protection of water intakes [Link to Water Intakes Notification List]
  - Protection of underground drinking water aquifers
  - Consider neutralizing agents prior to cleanup
- Removal, decontamination and treatment of injured or potentially exposed personnel
- Environmental cleanup/restoration
- Proper transportation, storage and disposal of contaminated debris & waste

Unified Command Considerations for an Incident Involving a Vessel

- Determine need to triage, treat, transport, decontaminate, and/or evacuate passengers and non-essential crew
- Establish a safety zone
- Vessel stability [Link to Salvage Section 3300]
- If vessel is underway, consult with states to determine whether to bring the vessel into port [Link to Port of Safe Refuge Document]
- Determine if Safe to Respond [Link to Safe to Respond]
- If vessel is on fire, consult the Marine Fire Fighting and SAR Plan [Link to Marine Fire Fighting Plan Executive Summary Section 8000]
  - Activate Tri-state Maritime Safety Association/MIRT Response Team

Unified Command Organization

The information in Figure 1 represents agencies that may support a hazardous substance release response operation and where they may potentially work in a Unified Command organization. If there is a suspected or actual terrorist threat associated with the incident, then

this information should be used in conjunction with the Unified Command organization structure outlined in the Terrorism Incident Annex.

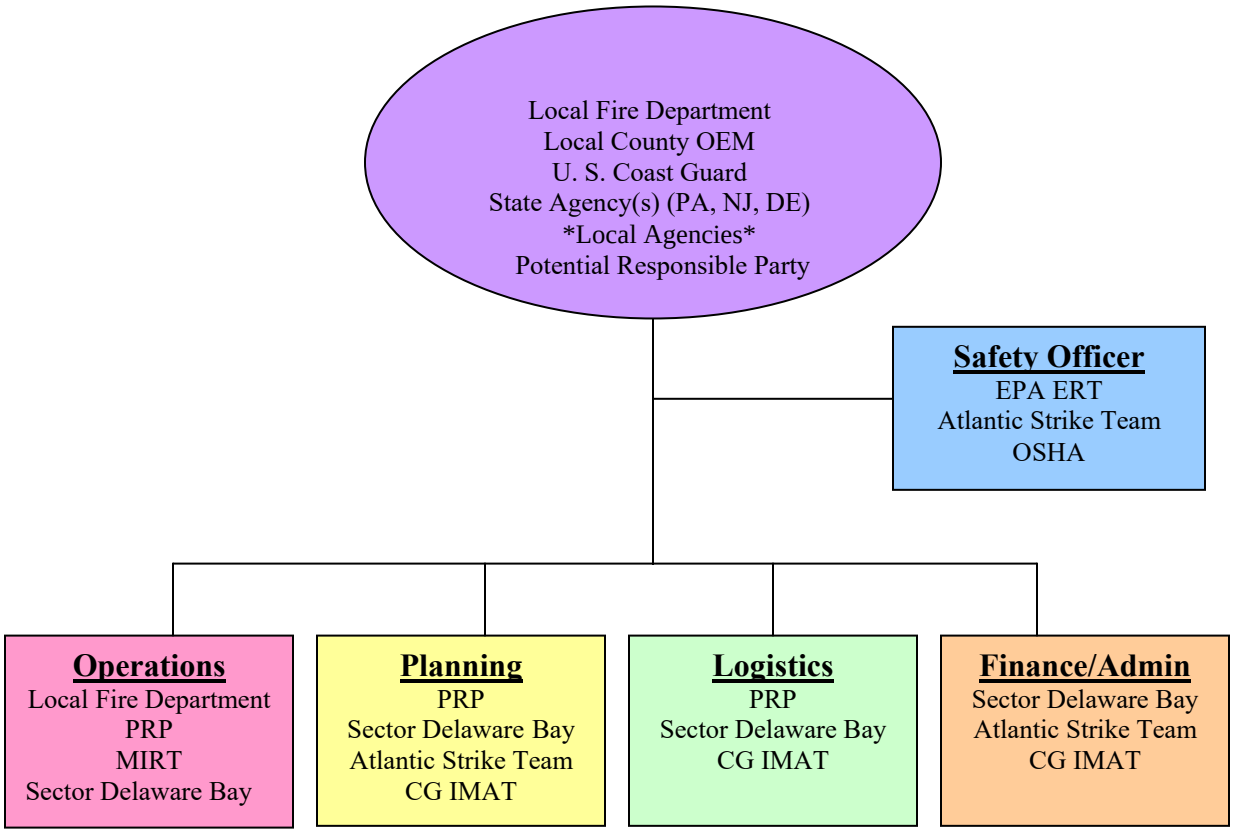

Figure 1. Depicts the potential agencies that may respond to a major hazardous substance release incident in the coastal zone. *Local governments are encouraged to contact the Unified Command through the Liaison Officer.*

Special Teams

The following special teams are equipped to respond to hazardous substance incidents, and should be considered as potential response resources:

- EPA Environmental Response Team (ERT)
- USCG Atlantic Strike Team (AST)
- OSHA (Region 2 New Jersey/Region 3 Pennsylvania and Delaware)
- ATSDR
- NOAA
- 3rd Civil Support Team (Pennsylvania)

Additional special teams can be found in the Special Teams Handbook [Link to the Handbook]
For local subject matter experts see:
[Link to Delaware Estuary Science Directory]

Annex PP

Biological Incident

Biological Incident Annex

Biological Incident Annex – Sector Delaware Bay

Introduction

[Link to the Biological Incident Annex in the NRP]

Response to a biological incident in the coastal zone can range from the illegal disposal of medical waste to the intentional release of a disease-causing organism. Initial response actions to a biological incident will depend on the type of incident and the cause or suspected cause of the incident (i.e. terrorist act).

The Coast Guard Incident Commander's response to biological incidents most likely will involve the use of both the Captain of the Port and Federal On-scene Coordinator (FOSC) authorities. The FOSC role is limited to disease causing agents that exist outside a host for a period of time and which can be physically removed from the environment.

Purpose

The purpose of this Annex is to provide initial response guidance upon notification of a suspected or actual report of a biological incident in the coastal zone.

If the biological incident is suspected or confirmed to be the result of a terrorist act, response to the incident should be initiated using this Annex, the Terrorism Incident Annex, and the Area Maritime Security Plan.

Using this Annex

The guidance in this Annex includes initial actions to be taken when responding to:

- Illegally dumped medical waste
- Quarantine (suspected or confirmed infectious disease on a vessel)
- Suspect or confirmed release of a biological agent involving:
  - Tainted, contaminated or otherwise suspect cargoes
  - Passengers and crew of a vessel
  - Buildings in the coastal zone

Illegally dumped medical waste

- Determine if competent authorities are taking appropriate action to remove the hazard (State and/or local health agencies are normally the lead agencies)
  - If yes,
    - Provide support as capabilities, authorities and safety of Coast Guard personnel allows
  - If no,
    - Contact local law enforcement and secure the area
    - Ensure that local health officials are aware of the incident
    - Determine if the medical waste presents an imminent and substantial danger to public health

- Initiate cleanup operations under CERCLA
- Hire a contractor authorized to handle medical waste to remove the hazard. Local cleanup contractors that can respond to a biological incident [Link to Contractor List Section 9751]

Quarantine (suspected or confirmed infectious disease on a vessel)

The intent of quarantine is to isolate the vessel involved, prevent those infected from going ashore without proper precautions, and to limit exposure to shoreside personnel (Marcus Hook Anchorage is the pre-identified quarantine station).

Upon notification that a vessel may have a possible or actual communicable disease onboard or is flying the quarantine flag the following actions should be taken:

- ❑ Immediately establish communications with the vessel to determine
  - Why the vessel is flying the quarantine flag
  - What disease is onboard
- ❑ Determine if the vessel has adequate crew to safely navigate the vessel
- ❑ Do not permit any Coast Guard personnel to board the vessel without approved safety precautions
- ❑ Immediately notify federal, state and local health departments
  - U.S. Public Health Department
  - Pennsylvania Department of Health
  - Philadelphia Department of Public Health
  - Delaware State Health Department
  - New Jersey State Health Department
- ❑ Gather medical information on affected crewmembers and passengers [Link to Medical Form Section 9750]
- ❑ Obtain a crew list
- ❑ Establish vessel security to control access (on and off the vessel)
- ❑ Maintain log of personnel that come on and off the vessel
- ❑ Ensure that Pilot's Association is notified
- ❑ Issue COTP order to
  - Implement a security plan
  - Prohibit cargo operations
  - Prohibit discharge of 'grey' water
- ❑ Notify unit's Public Health Doctor to advise the Command and provide liaison with local health officials
- ❑ Direct agent to get medical assistance for crew
- ❑ As directed by public health incident commander implement port quarantine plan [Link to Quarantine Policy Section 9754]
- ❑ Notification to the NRC will result in the NRC Notifying the Center for Disease Control requesting assistance from Agency for Toxic Substances and Disease Registry (ATSDR)
- ❑ Notify Customs and Border Protection

Biological Incident Annex – Sector Delaware Bay

Suspected or confirmed release of a biological agent

The actions that the Coast Guard Incident Commander takes in response to a suspected or confirmed release of a biological agent will be driven by many factors:

- Is the incident on a vessel? If yes,
  - Have the crew and/or passengers been impacted?; or,
  - Is it the vessel's cargo?
- Is the incident at a facility or building in the coastal zone?
- Is the intelligence credible?

For any suspected or confirmed biological incidents involving vessels

- Consult with appropriate agencies to determine details for issuing a Captain of the Port Order directing the vessel to remain offshore or go to a safe anchorage [Link to Port of Safe Refuge/Security Event on a Vessel Document]
- Work with the Philadelphia FIST to determine if threat is credible or non-credible
  - If credible, support the Department of Health and Human Services which is the Coordinating Agency and the Federal Bureau of Investigation [Refer to Terrorism Incident Annex]
- Initiate Critical Incident Communications procedures [Link to Critical Incident Communications Procedures Section 1050]
- Determine if Safe to Respond
  - Work with the Unified Command to determine the control zones (hot, warm, cold)
  - Ensure Unified Command communicates location of zones to response personnel
  - Document Safe to Respond determination
- Support designated public health officials to minimize the health risk of passengers and crew
  - Isolation of contaminated areas
  - Gross decontamination for exposed personnel (showers)
  - Minimize spread by securing contaminated articles (bag suspected clothing)
- Ensure all crew, pilot and passengers are accounted for and maintain positive control
- Determine if a safety zone will be required (waterside and landside)
- Determine any actions required for the safety of the crew and any passengers.
- Contact District-5 (marine safety) for determination if a Statement of No Objection (SNO) is required for law enforcement boarding
- If necessary, request a Crisis Exemption from the Environmental Protection Agency for the use of any chemical countermeasures that use products regulated by the Federal Insecticide, Fungicide, and Rodenticide

Act (FIFRA) of 1996 [Link to Guidance for Obtaining a FIFRA Crisis Exemption Section 9752]

- Crisis communications
  - Medical professionals should communicate with the public
  - Public health are the primary spokespersons for biological incidents
- Determine need to obtain CERCLA funding

If suspected source for the biological agent is cargo

The Unified Command should consider the following priorities, objectives and determinations when responding to a suspected biological agent that involve a vessel's cargo.

Unified Command Priorities

- Safety of boarding teams
- Public safety
- Selecting a location to offload suspected cargo/passengers
- Disposal of the cargo

Unified Command Objectives

- Conduct security boarding
  - Boarding team to examine ship's medical log to determine if any entries were made regarding crew's possible exposure to a biological agent
- Check for secondary devices (explosives)
- Conduct non-intrusive assessment of suspect cargo testing for:
  - Flammable
  - Radiological
  - Chemical
  - Biological
  - Explosives
- Ensure the preservation of evidence

Unified Command Determinations

- Determine the location where suspected cargo should be offloaded [Link to Port of Safe Refuge Document]
  - At anchorage
  - Pier side
- Determine need to establish a Science Team
- Determine where to dispose of the cargo
  - At sea

- On land – may require State permit for disposal, a problem may occur when crossing state boundaries

Unified Command Organization

The cooperation of many organizations will be required to successfully respond to and mitigate the threat posed by a biological incident. The information in Figure 1 represents agencies that may support a biological response operation and where they may potentially operate in a Unified Command organization. This information should be used in conjunction with the Unified Command organization structure outlined in the Terrorism Incident Annex.

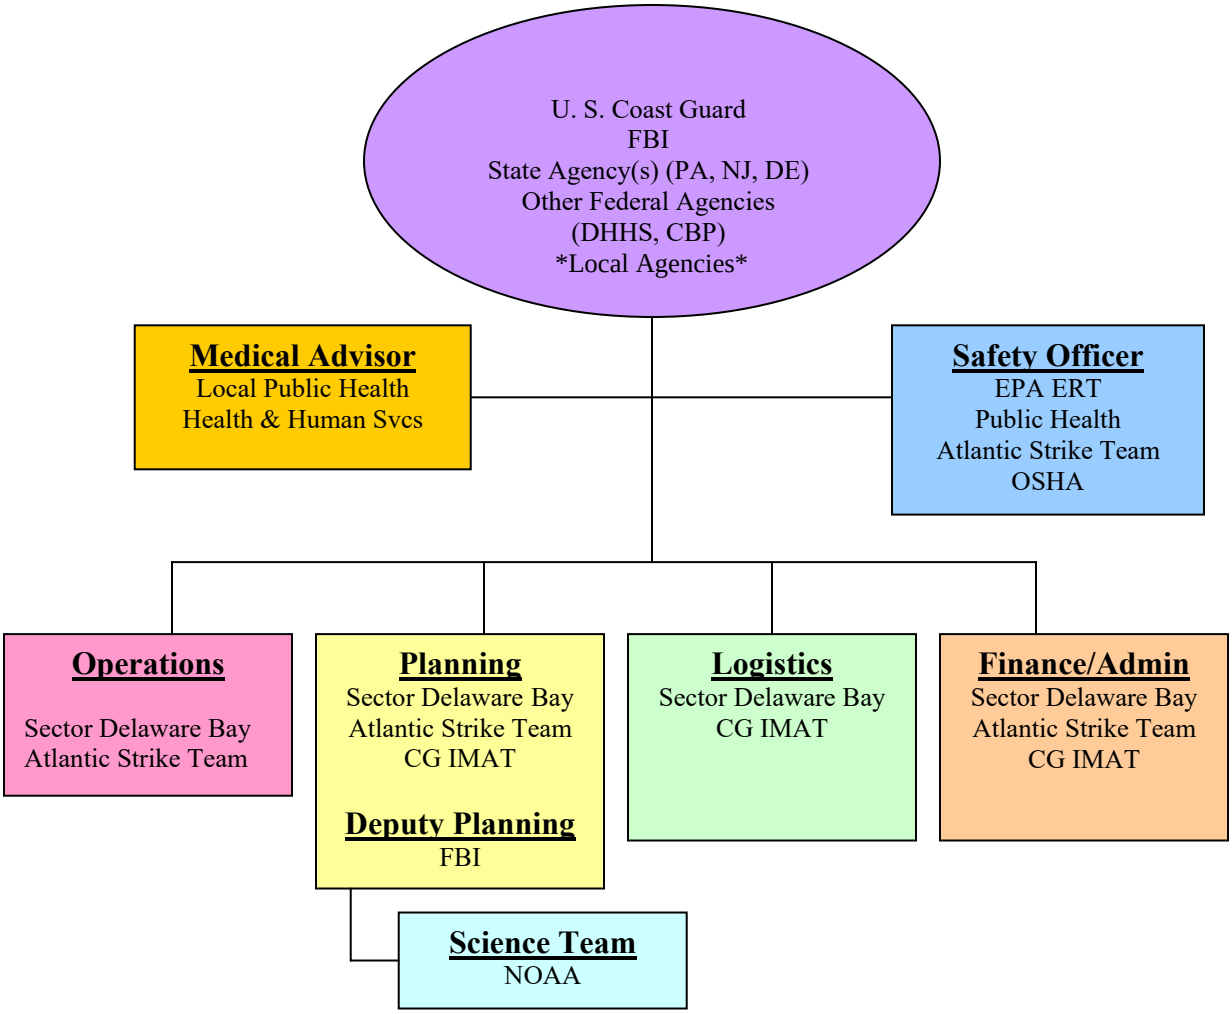

Figure 1. Depicts the potential agencies that may respond to a biological incident in the coastal zone. The information in this Figure should be used in conjunction with the ICS organization structure in the Terrorism Incident Annex.
Local governments are encouraged to contact the Unified Command through the Liaison Officer.

Science Team: The Science Team is led by NOAA's Scientific Support Coordinator and is responsible for:

- Determining appropriate entry procedures for inspecting the interiors of suspected containers of container cargo
- Developing a sampling plan
- Developing disposal protocols for unknown biological hazards
- Developing plan to transport and dispose of contamination

The Science Team may have representation from a wide variety of agencies and entities including but not limited to:

- Center for Disease Control and Prevention
- U.S. Department of Agriculture
- USCG Atlantic Strike Team
- Environmental Protection Agency Region II and III
- Request for EPA assistance made through their Regional Response Center 24-hour number
- Food and Drug Administration
- State Health Agencies
  - Delaware DHSS
  - New Jersey
  - Pennsylvania
- Animal Plant and Health Inspection Service (APHIS)
- State Departments of Environmental Protection
  - Delaware Department of Natural Resources and Conservation
  - New Jersey Department of Environmental Protection
  - Pennsylvania Department of Environmental Protection

A Building Structure in the Coastal Zone

Local and state health agencies have primary jurisdiction in responding to biological incidents. The Coast Guard Incident Commander will ensure that:

- Competent authorities are responding
- Notifications are made to the appropriate authorities:
  - Environmental Protection Agency Region II or III
  - Federal Bureau of Investigation
    - Philadelphia office
    - Newark Office
    - Baltimore Office
- The incident site is secured
- A site assessment is conducted
  - Sampling and analysis plan

- Once situation is stable the CGIC will begin transferring the role of Federal On-scene Coordinator to the appropriate EPA region [Link to Guidance for Transitioning On-scene Coordinator from the USCG to the EPA Section 9760]

Special Teams

The following special teams are equipped to respond to biological incidents, and should be considered as potential response resources:

- EPA Emergency Response Team (ERT)
- USCG Atlantic Strike Team (AST)
- OSHA
- ATSDR
- NOAA
- Pennsylvania Special Teams are accessed through PEMA
  - Local Hazmat Teams
  - 3rd WMD Civil Support Team
- Delaware Special Teams are accessed through DEMA
- New Jersey Special Teams are accessed through NJ OEM

Additional special teams can be found in the Special Teams Handbook [Link to the Handbook]

For Local subject matter experts see:
[Link to Delaware Estuary Science Directory]

Guidance to Use

Insecticides

Fungicides

Rodenticides

9752 Guidance for Obtaining Federal Insecticide, Fungicide, and Rodenticide Act (FIFRA) Crisis Exemption

Introduction

The use of a chemical agent (Pesticide) for a purpose for which it has not been approved by the Environmental Protection Agency will require a FIFRA Section 18 Crisis Exemption prior their use.

Purpose

The purpose of this section is to outline the U.S. Coast Guard's process for obtaining a FIFRA Crisis Exemption to allow for chemical decontamination of biological agents. When the Coast Guard Incident Commander (operating under their OSC authority) in consultation with the Unified Command and the Science Team makes the determination that the use of a chemical pesticide is warranted, a request to the EPA for a FIFRA crisis exemption will have to be made. This Crisis Exemption allows for the unregistered use of chemicals (pesticide) for a period of 15 days.

Procedures for FIFRA Crisis Exemption

- If there is no EPA representative on the incident command team, notify the appropriate EPA Regional Response Center.
  Region II - 732-548-8730
  Region III - 215-814-9016
- The Coast Guard in conjunction with EPA representative should contact the EPA Headquarters FIFRA office.
- Notify the appropriate state agencies.
- Develop a *Remedial Action Plan* (RAP) for EPA approval.
  - The *Remedial Action Plan* outlines:
    - The reasons for using an unconventional pesticide
    - Project planning
    - Health and safety concerns
    - The fumigation process

The RAP may be authored by the contractor and must be specific in nature to the incident.

- Develop an *Ambient Air Monitoring Plan* (AAMP) for monitoring fumigation operations for EPA approval.
  - The *Ambient Air Monitoring Plan* outlines:
    - The objectives
    - Implementation procedures
    - Equipment
- Develop a *Sampling & Analysis Plan* (SAAP) to address the type, number and procedures for collecting samples and laboratory procedures for analysis to ensure accurate consistent results.
- Develop an *Emergency Response Plan* (ERP), which is an incident specific safety plan, which must be submitted to state agencies.

    - The Emergency Response Plan outlines:
        - Hazards associated with operations
        - Safety precautions
        - Personal protective equipment
        - Contingencies
        - Safety concerns.
- Send a formal request letter from the Coast Guard requesting the FIFRA Crisis Exemption to the EPA. [Link to example FIFRA Request Letter Section 9753]
    - The letter must be written on United States Coast Guard letterhead and contain within:
        - The name of the proposed chemical
        - A brief reason for the urgency
        - Timeframe for the chemical's use
        - A contact point for the Coast Guard
        - The signature of the CGIC
- The Letter must be submitted to EPA Headquarters Office of FIFRA and Pesticide Program. In addition to the request Letter the RAP, AAMP, and SAAP must be attached.

Criteria for State approval

Depending on the state where the incident is occurring, the impacted state will have to issue an exemption in addition to EPA Crisis Exemption. Procedures for each state (New Jersey, Pennsylvania and Delaware are outlined below:

New Jersey

The New Jersey Department of Environmental Protection Pesticide Control Program issues the exemption.

- Contact NJDEP Bureau of Pesticides Operations
    - Phone# (609) 984-6647 Fax# (609) 984-6555 (Urgent)
- Submit a copy of the Request Letter along with the attached RAP, AAMP, SAAP and ERP.
- Provide information on contractor to be used, including contact information.
    - Contractor will need a Pesticide Applicator Business license & an employee with a Commercial Certified Pesticide Applicator license, in most cases.
    - If contractor does not have the required licenses then completion of training, certification exams & licensing forms, & payment of license fees will be required prior to issuance of licenses.
    - Contractor's licensed Commercial Certified Pesticide Applicator will be required to remain on-site during the course of any fumigation activities.
- After review and approval of requested documents & verification of required licenses, the Chief of the Bureau of Pesticide Operations for NJDEP will issue an approval letter.
- On-site monitoring by NJ DEP personnel may be required.

- After review and approval of requested documents, the Chief of the Bureau of Pesticide Operations for NJDEP will submit an approval letter.

Pennsylvania

The Pennsylvania Department of Agriculture Pesticides Section issues the exemption.

- Contact Pennsylvania Department of Agriculture (Pesticides) in regards to exemptions.
  - Phone# (717) 772-5217 Fax: (717) 783-3275 (Urgent)
- Submit a copy of the Request Letter along with the attached RAP, AAMP, SAAP and ERP.
- Ensure contractor is licensed in the Commonwealth of Pennsylvania.
  - This required registration might include forms and fees.
  - Contractor personnel were required to have Pesticide Application License and certification. This person had to remain on-Site during the course of fumigation activities.
- After review and approval of requested documents, the Pennsylvania Department of Agriculture Pesticides Section Administrator will submit an approval letter.

Delaware

The Delaware Department of Agriculture Pesticides Section issues the exemption.

- Contact Delaware Department of Agriculture (Pesticides) in regards to exemptions.
  - Phone# (302) 698-4570 Fax: (302) 697-4483 (Urgent)
- Submit a copy of the Request Letter along with the attached RAP, AAMP, SAAP and ERP.
- Ensure contractor is licensed and insured in the State of Delaware.
  - This required registration may include forms and fees.
  - Contractor personnel were required to have Pesticide Application License. This person had to remain on-Site during the course of fumigation activities.
- After review and approval of requested documents, the Delaware Department of Agriculture Pesticides Section Administrator will submit an approval letter.

Follow-up

In accordance with the FIFRA Section 18 Crisis Exemption, a final report is to be submitted to EPA. This document must be received within three months of the last date of fumigation. The contractor usually generates this documentation.

Bioterrorism

Communicable Disease

Quick Response Card

BIOTERRORISM/ COMMUNICABLE DISEASE

	Date/Time
Short Title:	**MISLE**
Watchstander:	**CIC**

INITIAL INFORMATION COLLECTION – AWARENESS:

Incident type:	**Location:**

	Direction/ Speed	Height	Direction	Air	Water
SUNRISE/ SUNSET	**TIDAL CURRENT**	**NEXT TIDE**		**MISCELLANEOUS**	
	Direction/ Speed	High/ Low	Time/ height		

CRITERIA FOR IMPLEMENTION OF QRC:

1. Notification that a bioterrorism event or potential exposure to a quarantinable / communicable disease has occurred aboard a maritime interest (i.e. cruise ship, cargo vessel, ferry (inbound and/or shore-side)).
2. Notification that a CG unit or employee was the subject of a bioterrorism threat or potentially exposed to a quarantinable /communicable disease.
3. Request by an external government agency, including the DOD, for CG assistance in responding to a biological incident.
4. Request by the CG to an external government agency for assistance in responding to a biological incident: This includes EPA, CDC, HHS, local public health or other law enforcement agencies.

Note 1: If biological terrorism is suspected, establish a MOTR conference call (See FLAG 095 MOTR)

Note 2: Operational Commanders are only required to make USCG resources available to CDC for quarantine enforcement and assistance when such use and availability does not conflict with higher priority operations (e.g., emergent SAR, MARSEC 2/3 ops).

INITIAL ACTIONS:

_____ If MEDEVAC is needed, utilize MEDEVAC QRC

_____ Brief appropriate Sector Chain of Command

_____ Open MISLE notification/case

_____ Print Vessel Critical Profile, add to MISLE case

_____ Brief appropriate agencies:

- NRC: 1-800-424-8802
- CDC POC: Julie Sinclair Office: 215-365-6401, Cell: 404-429-4299
- CBP Office: 215-717-5951 or 215-717-5803

_____ Consider prompting a CIC notification (See CIC QRC)

_____ Notify Pilots if other vessel traffic impacted.

_____ Issue Safety Broadcast Notice to Mariners if necessary

_____ Utilize quarantine anchorage, Marcus Hook Anchorage

_____ Notify Gary Wolf from the U.S. Food and Drug Administration (if it involves a commercial fishing vessel or impacts food supply (609-287-2991).

_____

_____

PLANNING:

_____ Receive or develop tactical plan

_____ Conduct ORM

_____ Determine appropriate security/safety zone and impact to other commercial/recreational traffic

_____ Make notifications IAW briefing matrix

PEACE MODEL – IDENTIFY HAZARDS				
☐ **P**lanning	☐ **E**vent Complexity	☐ **A**sset Selection	☐ **C**ommunications	☐ **E**nvironment
STAAR MODEL – IDENTIFY OPTIONS

11. U.S. Coast Guard Incident Management Handbook, COMDTPUB P3120.17

12. The National Response Framework (NRF)

Definitions:

1. Quarantinable Disease: Any of the communicable diseases listed in an executive order of the President, as provided under section 361 pf the Public Health Service Act (42 USC 264). The current list includes: Cholera, Diphtheria, Infectious tuberculosis, Plague, Severe Acute Respiratory Syndrome (SARS), Smallpox, Yellow fever, Viral hemorrhagic fevers, & Influenza caused by novel/reemerging virus with a potential to cause a pandemic
2. Communicable Disease: An illness due to a specific infectious agent or its toxic products which arise through the transmission of that agent or its products from an infected person or animal or reservoir to a susceptible host, either directly or indirectly through an intermediate host, vector or the inanimate environment.
3. Isolation: The separation of an infected person from healthy people and the restriction of an infected person's movement to stop the spread of the disease.
4. Quarantine: The separation and restriction of movement of persons who are not yet ill, but who have been exposed to an infectious agent and are therefore potentially infectious.

Background:

1. The responsibility within Coast Guard Headquarters (CGHQ) for the CGHQ coordination of all biological incidents is shared between the Commandant's Office of Counterterrorism and Defense Operations (CG-532) and the Office of Incident Management and Preparedness (CG-533). CG-532 will be the lead office for bioterrorism events. CG-533 will be the lead office for communicable disease events and for the release of disease-causing agents.* CG-532 and CG-533 shall be notified for all related events.
   Note: When a biological response is contemplated by armed, uniformed CG personnel aboard vessels and at shore facilities, the activity is considered an MLE mission and is governed by the policy established in the *Maritime Law Enforcement Manual (MLEM)*, COMDTINST M16247.1 (series). The policy for Coast Guard response to public health alerts and quarantines is in Appendix J of the *M*LEM. The policy for response to pollutants and contaminants, including disease-causing agents is found in the National Contingency Plan (40 CFR 300).
   Note: A suspected or actual bioterrorism event aboard a vessel is a trigger for the Maritime Operational Threat Response (MOTR) Plan. During a bioterrorism event where a biological agent is intentionally released, the CG could respond under auspices of the National Contingency Plan (NCP) and Area Contingency Plan (ACP) for the hazmat response and the Area Maritime Security Plan (AMSP) for the terrorism response.

2. The National Response Center (NRC) and CG National Command Center (CGNCC) are both part of the CGHQ Office of Current Operations. The NRC shall be notified of all significant biological incidents by calling **1-800-424-8802**. The NRC will also notify the Command Center Duty Officer of significant biological incidents. The Centers for Disease Control and Prevention (CDC) EOC **1-770-488-7100** and The National Strike Force Coordination Center (NSFCC) will be notified by the Command Center for biological incidents that require the attention of the National Strike Force and other federal agencies. The Public Information Assistance Team (PIAT) will be notified by the Command Center, through the NSFCC, whenever a request is made for their assistance.

*The term "disease-causing agent" is included in the definition of "pollutants and contaminants" as defined in the NCP (40 CFR 300.5)

1. (U) SITUATION

a. (U) General

(1) (U) This appendix provides guidance to Coast Guard District Five units for CG operations in response to terrorist acts and threats against the marine transportation system, critical assets and infrastructure, and the public. This includes CG response to conventional terrorist incidents as well as CG response to Weapons of Mass Destruction (WMD) incidents. CGD5 units may execute response operations within this appendix separately, or in conjunction with other appendices within this OPLAN.

(2) (U) Terrorism and the use of weapons of mass destruction (WMD) are asymmetric threats that may be initiated through a variety of means or delivery methods. In 1993 and 1995, respectively, terrorists used conventional explosive devices to attack the World Trade Center and the Murrah Federal Building. In March 1995, terrorists attacked subway riders in Japan with Sarin, a chemical warfare agent. On September 11, 2001, terrorists used hijacked airliners as powerful airborne bombs to attack the Pentagon and the World Trade Center. Clearly, terrorists have displayed the will and the means to attack our citizens and infrastructure and to cause significant damage and kill innocent civilians.

(3) The openness of U.S. ports, necessary for the free and effective movement of commerce, makes them particularly vulnerable to acts of terrorism. All terrorist incidents and attacks within the maritime domain require Coast Guard response. Potential terrorist targets include Coast Guard property and/or personnel; other Federal property; passenger vessels and terminals; port facilities; waterfront industries and infrastructure covered by the Critical Asset Assurance Program (CAAP); offshore terminals; petroleum production platforms; and merchant vessels.

(4) (U) With its unique capability as both a law enforcement agency and a military force, the Coast Guard is the lead Federal agency for maritime homeland security. This designation is particularly appropriate in that terrorism may be viewed as a criminal act or an act of war, if the act can be linked to a hostile nation.

b. (U) Definitions. The following definitions are important to an understanding of the Coast Guard’s response to terrorist threats and/or terrorist acts.

(1) (U) Consequence Management. Predominantly an emergency management function, includes measures to protect public health and safety, restore essential government services, and provide emergency relief to governments, businesses, and individuals affected by the consequences of terrorism.

(2) (U) Crisis Management. Predominantly a law enforcement function, includes measures to identify, acquire, and plan the use of resources needed to anticipate, prevent, and/or resolve a terrorist act or threat.

(3) (U) Enemy

(a) (U) Any person, group, or organization who kills or injures, or threatens to kill or injure, persons for personal, religious, ideological or political gain.

(b) (U) Any person, group, or organization who damages or destroys, or threatens to damage or destroy, property or the environment for personal, religious, ideological, or political gain.

(4) (U) Incident. An occurrence or event, natural or human-caused, that requires an emergency response to protect life or property. Incidents include, for example, major disasters; emergencies; terrorist threats; terrorist attacks; wildland and urban fires; floods; hazardous materials spills; nuclear accidents; aircraft accidents; earthquakes; hurricanes; tornadoes; tropical storms; war-related disasters; public health and medical emergencies; and other occurrences requiring an emergency response.

(5) (U) National Incident Management System (NIMS). NIMS provides a consistent doctrinal framework for incident management at all jurisdictional levels, regardless of the cause, size, or complexity of the incident. The activation of the NRF and its coordinating structures and protocols — either partially or fully — for specific Incidents of National Significance provides mechanisms for the coordination and implementation of a wide variety of incident management and emergency assistance activities. Included in these activities are Federal support to state, local, and tribal authorities; interaction with nongovernmental, private donor, and private-sector organizations; and the coordinated, direct exercise of Federal authorities, when appropriate.

(6) (U) National Response Framework (NRF). The NRF is an all-discipline, all-hazards plan that establishes a single, comprehensive framework for the domestic incident management. It provides the structure and mechanisms for the coordination of Federal support to state, local, and

tribal incident managers and for exercising direct Federal authorities and responsibilities. The NRF assists in the important homeland security mission of preventing terrorist attacks within the United States; reducing the vulnerability to all natural and man-made hazards; and minimizing the damage and assisting in the recovery from any type of incident that occurs.

(7) (U) Terrorism

(a) (U) Any activity that (1) involves an act that (a) is dangerous to human life or potentially destructive of critical infrastructure or key resources; and (b) is a violation of the criminal laws of the United States or of any State or other subdivision of the United States; and (2) appears to be intended (a) to intimidate or coerce a civilian population; (b) to influence the policy of a government by intimidation or coercion; or (c) to affect the conduct of a government by mass destruction, assassination, or kidnapping.

(8) (U) Terrorism Counter-Action. Actions taken to prevent and counter terrorist attacks / incidents. The two components of terrorism counter-action are anti-terrorism and counter-terrorism.

(a) (U) Anti-terrorism. Proactive measures taken to prevent terrorist incidents from occurring, including hardening potential targets and developing procedures to detect planned terrorist actions.

(b) (U) Counter-terrorism. The tactical reaction to a terrorist event, including direct contact with the terrorist force to end the incident with minimum loss of life. Tactics include negotiation and, if necessary, the use of armed forces.

(9) (U) Terrorist

(a) (U) An individual, group, or subgroups that use unlawful force, violence, or terror against persons or property to intimidate or coerce a Government, the civilian population, or any segment thereof, to achieve a result or the furtherance of political or social objectives.

(10) (U) Weapon of Mass Destruction (WMD)

(a) (U) Any explosive, incendiary, or poison gas, bomb, grenade, rocket having a propellant charge of more than 4 ounces, or missile having an explosive or incendiary charge of more than one-quarter ounce, or mine or similar device.

(b) (U) Any weapon that is designed or intended to cause death or serious bodily injury through the release, dissemination, or impact of toxic or poisonous chemicals or their precursors.

(c) (U) Any weapon involving a disease organism.

(d) (U) Any weapon that is designed to release radiation or radioactivity at a level dangerous to human life.

c. (U) Assumptions

(1) (U) In general, terrorist threats / acts will come from / be carried out by a small group that will engage in a series of terrorist acts or a single, high-visibility act to focus attention on a cause and to communicate a sense of vulnerability to the general population.

(2) (U) An incident(s) will involve a U.S. citizen(s), U.S. vessel(s), and/or occur within U.S. territory or U.S. territorial seas.

(3) (U) An incident(s) will be significant enough to require the commitment of Federal forces.

(4) (U) The Coast Guard will continue to perform all statutory duties during response operations. While responding to requests for assistance from the Department of Defense and other Federal agencies, the Coast Guard will continue to meet mission requirements.

(5) (U) A sufficient number of Coast Guard Reservists will be involuntarily recalled to active duty to meet contingency personnel requirements for response operations.

(6) (U) Coast Guard Auxiliary personnel can backfill for active duty personnel conducting Coast Guard response operations.

(7) (U) The Coast Guard will remain within the Department of Homeland Security.

d. (U) Legal Considerations

(1) (U) 14 USC 2 provides the Coast Guard authority to engage in planning for terrorist incidents. One of the Coast Guard's primary duties is enforcing or assisting to enforce all applicable federal laws upon the high seas and waters subject to United States jurisdiction.

(2) (U) 14 USC 141 authorizes the Coast Guard to utilize its personnel and facilities to assist, upon request, other Federal, state, and local agencies.

(3) (U) 14 USC 89 authorizes the Coast Guard to make inquiries, examinations, inspections, searches, seizures, and arrests upon the high seas and waters over which the United States has jurisdiction, for the prevention, detection, and suppression of violations of U.S. laws.

(4) (U) The Magnuson Act, 50 USC 191, provides Coast Guard District Commanders and Captains of the Port (COTP) with broad authority in situations which may affect the safety and security of vessels, harbors, ports, and waterways.

(5) (U) The Ports and Waterways Safety Act, 33 USC 1221 through 1236, gives the Coast Guard jurisdiction to control vessel or waterfront facility operations to prevent physical or environmental damage to any U.S. port.

(6) (U) In 1986, terrorists hijacked the Achille Lauro and murdered a U.S. citizen. This incident provided the impetus for the United States and the International Maritime Organization to establish international measures to help prevent subsequent occurrences. In addition, the International Maritime and Port Security Act (46 USC Appendix 1801-1809) and the amended Ports and Waterways Safety Act authorize the Coast Guard to carry out or require measures, including inspection, port and harbor patrols, the establishment of security and safety zones, and the development of contingency plans and procedures to respond to acts of terrorism.

e. (U) Pre-Incident Conditions

(1) (U) Training and Security. Coast Guard personnel maintain a level of training necessary to carry out statutory law enforcement duties to ensure, through the use of appropriate and sufficient force, physical security at Coast Guard facilities. This preparedness increases the possibility terrorists may be apprehended, making many Coast Guard facilities less attractive targets.

(a) (U) Coast Guard tenant commands (those located on Coast Guard facilities for which another command is responsible) are not responsible for facility

security preparations. However, tenant commands are responsible for security within their command's spaces.

(b) (U) Coast Guard commands housed in GSA-controlled buildings or facilities the Coast Guard leases must make prior arrangements for enhanced security. Coast Guard personnel are not to be used for facility / building security. Coast Guard commands are responsible for security within their assigned spaces.

(2) (U) Regulatory Functions. The Coast Guard Captain of the Port (COTP), as the Federal Maritime Security Coordinator (FMSC), is charged with enforcing the Maritime Security regulations found in Subchapter H to reference (b). These regulations are aimed at deterring threats and preventing damage to vessels and facilities within U.S. ports. The FMSC also heads local Area Maritime Security Committees within the port areas for the purpose of coordinating security planning and operations.

f. (U) Support from other Agencies. Coast Guard District Five Sector and unit commanding officers shall establish and maintain relationships, for anti-terrorism planning, with other military services and Federal, state, and local agencies. These entities may play a major role in terrorism response operations; the Coast Guard may receive support from, or provide support to, one or more of the following:

(1) (U) Federal

(a) (U) Department of Defense (DOD)

1. (U) Commander in Chief, Joint Forces Command (CINCJFCOM), Joint Task Force for Civil Support (JTF-CS). JTF-CS can deploy to the scene of a weapons of mass destruction incident to provide command and control over other responding DOD forces.

2. (U) Secretary of Defense. The Secretary of Defense is responsible for all military preparations and operations, including, when directed, the employment of military forces at the scene of an actual or potential terrorist incident. In the event of a terrorist incident involving a nuclear weapon from the DOD's inventory, DOD will assume responsibility as lead federal agency (LFA) in accordance with reference (g). DOD responsibilities are carried out principally through the Department of the Army. Reference (h)

provides for the provision on Coast Guard resources to assist Army counter-terrorism operations.

(b) (U) Department of Homeland Security (DHS)

1. (U) Coast Guard Intelligence Coordination Center (ICC). The ICC provides Coast Guard specific security and threat assessment information and analysis. Intelligence assessments are produced on a scheduled basis, but spot reports in response to special situations may be provided upon request. The function of the ICC and the intelligence assessment process are discussed in detail in Volume VII of reference (g).

2. (U) Federal Emergency Management Agency (FEMA). Under the terrorism incident annex to reference (s), FEMA is the designated lead federal agency for consequence management. Additionally, reference (s) directs FEMA to ensure that existing policies and procedures are adequate to respond to the consequences of terrorism (e.g., widespread damage, multiple personnel casualties, disruption of transportation or communications systems, etc.). FEMA will take measures to protect public health and safety, restore essential government services, and provide emergency relief to state and local governments, businesses, and individuals.

(c) (U) DEPARTMENT OF JUSTICE (DOJ)

1. Federal Bureau of Investigation (FBI). The FBI is the lead Federal agency for criminal investigations of terrorist acts or terrorist threats, as well as intelligence collection activities within the United States. The FBI manages these activities from an FBI command post or Joint Operations Center (JOC). The command post or JOC coordinates the necessary Federal law enforcement assets required to respond to and resolve the threat or incident with state, local, and tribal law enforcement agencies.

The Coast Guard and FBI maintain a Memorandum of Understanding regarding mutual assistance in support of CG/FBI operations to counteract terrorist incidents in the maritime environment. See reference (q).

2. (U) Attorney General. The Attorney General is responsible for coordinating all Federal activity during major domestic terrorism crises and advises the President whether to commit military forces in response to a terrorism situation. This includes coordinating the activities of state and local agencies and the administration of justice in the affected area.

3. (U) Bureau of Alcohol, Tobacco, Firearms and Explosives (ATF). ATF is a law enforcement organization within the United States Department of Justice with responsibilities dedicated to reducing violent crime, collecting revenue, and protecting the public. ATF enforces Federal laws and regulations relating to alcohol, tobacco, firearms, explosives and arson by working directly and in cooperation with others to support and assist Federal, state, local, and international law enforcement. ATF's four National Response Teams can respond, within 24 hours, to major bombing and arson scenes anywhere in the United States. The teams combine special agents, forensic scientists, and technical specialists. ATF can also provide vital resources to local communities in the wake of an explosives incident.

(d) (U) Department of State (DOS). The DOS is designated Lead Federal Agency for terrorism response outside U.S. territory involving U.S. persons, property, or interests and is responsible for collection of information and intelligence on terrorist activities overseas.

(e) (U) Department of Transportation (DOT) MARITIME ADMINISTRATION (MARAD). MARAD provides emergency port operations under national emergency conditions, through the National Shipping Authority and the Federal Port Controller Network.

(2) (U) State

(a) (U) State Governor. State governors have command authority over all state resources, including State Police, National Guard (which governors may activate in response to a terrorist act), and the state emergency management agency.

(b) (U) State Law Enforcement Authorities. State Police, which may include a marine division, have concurrent jurisdiction over coastal and inland state waters. Many State Police organizations have special weapons

and tactics (SWAT) teams to respond to hostage or barricaded-subject situations.

(3) (U) Local

(a) (U) Local Law Enforcement Authorities. Local law enforcement authorities have primary responsibility for maintaining law and order within their jurisdictions. They often will be among the first called and first to respond to a terrorist incident. Many local police forces in large urban areas have SWAT teams for responding to hostage or barricaded-subject situations.

(b) (U) Local Fire Departments. Many local urban fire departments have specialized hazardous material (HAZMAT) units for responding to incidents involving hazardous materials. Firefighting assets may be staged during the crisis management phase of an incident and will respond during the consequence management phase. Many of these units have received Federally-sponsored WMD response training.

(c) (U) Local Emergency Medical Services (EMS). Local EMS organizations are responsible for responding to requests for medical assistance, depending upon the severity of the incident in terms of number of casualties and extent of physical/property damage (i.e., cause of incident, such as a weapon of mass destruction involving nuclear, biological, and/or chemical (NBC) agents). EMS personnel may be restricted from responding to a site by the Lead Federal Agency (LFA) until protective capabilities for responders are available.

(4) (U) Private

(a) (U) Facilities and Vessels. In accordance with maritime security regulations found in Subchapter H of reference (b), vessel and facility owners and operators are responsible for the security of their vessels and facilities respectively. Facility owners will often hire civilian security services; these services have no law enforcement authority.

(5) (U) Area Maritime Security Committees (AMSC). In accordance with part 103 of reference (b), AMSCs are responsible for identifying critical port infrastructure; identifying threats and vulnerabilities; determining mitigation strategies; communicating changes in maritime security levels; and communicating other security-related

information to port stakeholders. AMSC members can be invaluable assets during response operations.

2. (U) Mission. In response to a terrorist threat or a terrorist act, CGDFIVE forces will conduct operations to protect Coast Guard resources from terrorist acts, contain the threat to public safety in the maritime domain, stabilize the incident(s), and support the lead Federal agency for terrorism response.

3. (U) Execution

a. (U) Concept of Operations

(1) (U) Commander's Intent. Coast Guard commands will effectively use available resources through risk-based decision making to safely and effectively respond to terrorist threats / incidents within their assigned operating areas; or provide support to other Federal, state, or local entities. The desired end-state is a response operation concluded in a safe, secure, and successful manner, followed by a smooth transition to normal operations.

(2) (U) General. A Coast Guard-designated Terrorism Response Coordinator (TRC) will coordinate Coast Guard response efforts. The TRC may also serve as an Incident Commander (IC).

Commanders may employ COTP authority to establish and enforce security zones around vessels or facilities at risk of terrorist acts or that have received terrorist threats. Implementing facility and vessel security measures will involve concurrent execution of the Terrorism Response, Facility Security, and/or Vessel Security Appendices of 9700 series OPLANs.

(3) (U) Crisis Management. In response to a terrorist threat or act, CGDFIVE units will assign tasking in priority order. Coast Guard response objectives are to preserve lives, protect the public by securing an incident scene, and obtain the safe release of hostages. Secondary and enabling objectives are to protect property and the environment; enforce applicable laws and preserve the integrity of evidence gathered; manage the flow of information to the press and public during the incident to protect hostages and response personnel from premature or ill-advised media disclosure that may adversely impact response effectiveness; and avoid giving the impression that the government can be intimidated by terrorists.

The Coast Guard may maintain incident command and may also coordinate with and/or support another entity by providing law enforcement and logistics support. Multi-agency responses will include state and local law enforcement agencies, which represent multiple jurisdictions. In response situations which require or involve multi-agency, multi-jurisdictional participation, responding agencies shall adhere to existing memorandums of agreement / understanding (MOAs/MOUs), which in the post-9/11 environment should incorporate the National Incident Management System (NIMS) and standardization dictated by the Incident Command System (ICS).

Should a terrorist threat or act result in an incident of national significance, the Attorney General is responsible for criminal investigations of terrorist threats or terrorist acts. The FBI will execute its role as Lead Federal Agency.

The FBI will likely establish a Crisis Management Team (CMT) to coordinate incident response. A Federal Forces Commander (FFC), usually the senior FBI agent on scene, will coordinate operations. The FBI will likely establish a Command Post and/or a Joint Operations Center (JOC) to coordinate and direct law enforcement and criminal investigation activities related to the incident.

b. (U) Employment. CCGDFIVE commands will act to protect themselves; continue to execute statutory missions; and respond, as able, to requests for assistance concerning a terrorist incident upon the high seas or waters subject to U.S. jurisdiction. If the Coast Guard is first to respond, the Coast Guard Incident Commander shall endeavor to contain and stabilize the incident.

(1) (U) Threat Evaluation. If a threat against a maritime asset or operation is received, the cognizant Captain of the Port or Sector Commander shall investigate to determine if the threat is credible. The FBI conducts formal threat credibility assessments in support of operations. Sector Commanders should report to CGDFIVE with results and recommendations.

(2) (U) Statutory Response. Standing Coast Guard law enforcement and port security missions and authorities apply to terrorism situations. Captain of the Port authority may be employed to establish and enforce safety or security zones around threatened or damaged port facilities and vessels.

(a) (U) Counter-Terrorism. The Coast Guard’s role in counter-terrorism operations is to support a

designated Lead Federal Agency or to serve as the lead.

1. (U) Crisis Management. During the crisis management phase of an incident response, the appropriate Sector Commander, as the TRC/IC, shall coordinate Coast Guard actions. The TRC may also designate an On-Scene Commander (OSC).

The TRC/IC has, at his/her disposal, the Maritime Security Response Teams (MSRT). Based in Chesapeake, Virginia, the MSRT provides the Coast Guard with an on-call counter-terrorism response capability.

The TRC/IC, if in a support role to a lead Federal agency, may provide support, to include providing such resources as personnel, vessels, aircraft, or other Coast Guard assets.

(b) (U) Assistance to State and Local Governments. State and local governments may require Federal assistance to perform disaster assistance missions following a terrorist incident. Section 141 of reference (a) authorizes the Coast Guard to utilize its personnel and facilities to assist Federal and state agencies upon request. Local Coast Guard units will cooperate with other responding agencies, but such cooperation shall neither compromise the safety of Coast Guard personnel nor affect the availability of boats and equipment for standard Coast Guard missions.

(3) (U) Reconstitution. If a Coast Guard facility is damaged or destroyed, necessary steps will be taken to restore the unit's capability and return the unit to service. MLCLANT can provide Damage Assessment Teams (DAT) to determine the long-term impacts and prioritize necessary repairs. See references (o) and (p).

c. (U) Rules of Engagement and Use of Force

(1) Although the Standing Rules Of Engagement (see Chapter 4 of reference (e)) are specifically not applicable within the territorial jurisdiction, Commandant has adopted them for Coast Guard operations within the U.S. Territory (shoreward of the outer edge of the 12 nautical mile territorial sea). They provide for individual and unit self-defense.

The Commandant’s Use of Force policy (see chapter 4 of reference (h)) provides guidance for the use of force necessary to accomplish the assigned mission when under

Coast Guard OPCON or TACON and applies to law enforcement situations as well as situations which involve the protection of U.S. property and/or personnel. Accordingly, commanding officers shall use the minimum force necessary to accomplish the mission.

DOD forces under Coast Guard OPCON or TACON will use reference (h) for employing warning shots and disabling fire, and use reference (e) for all other purposes. Coast Guard units under DOD OPCON or TACON shall follow the guidance in reference (e) for all purposes. Note that under such circumstances, actions may be governed by use of force rules contained in other DOD directives or as determined on a case-by-case basis for specific missions.

Commanders should ensure that units operating in the vicinity of each other but under different OPCON have compatible use of force guidance.

When Coast Guard unit commanders shift OPCON or TACON to a non-Coast Guard command or accept OPCON or TACON for a non-Coast Guard unit, they shall ascertain the applicable use of force policy in effect. They may request, via the chain of command to COMLANTAREA or the Commander of the Joint Task Force Commander (or other applicable Commander), supplemental Rules of Engagement, as appropriate.

The message formats contained in Appendix F to Enclosure J of reference (e) are appropriate for such requests and shall be used whenever practical. Incident Commanders may seek use of force guidance from the CCGDFIVE (IMT), as necessary.

Nothing in this appendix or this OPLAN limits a commander’s inherent authority and obligation to use all necessary means available and to take all appropriate actions in self-defense of the commander’s unit and other U.S. forces in the vicinity.

d) (U) Deployment

(1) (U) CGDFIVE and ISC Portsmouth will coordinate assets deployed within the Fifth District. The Coast Guard Incident Commander must provide adequate berthing, messing, and operational support for temporarily assigned personnel.

(2) (U) Inter-district deployment of personnel and equipment to units supporting response operations is not anticipated. However, if/when required, the Maintenance

and Logistics Command, Atlantic will coordinate transportation.

(3) (U) When transit times between Coast Guard units and response operating areas are too long, personnel may be deployed to a forward operating base. The Coast Guard Incident Commander must provide adequate berthing, messing and operational support for these personnel. Assets and personnel will remain within the Fifth District.

e) (U) Tasks

(1) (U) CCGDFIVE shall:

(a) (U) Take overall responsibility for CCGDFIVE units' terrorism counter-actions.

(b) (U) Establish liaison with FBI and Federal Emergency Management Agency (FEMA) regional offices and appropriate Federal and state law enforcement agencies and civil authorities for terrorism response planning and operations.

(c) (U) Monitor current intelligence for possible threats against Coast Guard facilities or activities within the Fifth District.

(d) (U) Serve as TRC for incidents within the Fifth District but beyond the territorial sea (three nautical miles).

(e) (U) When deemed appropriate for tactical response to a terrorist threat / incident, request the use of the MSRT.

(2) (U) CCGDFIVE AIR STATION COMMANDING OFFICERS shall:

(a) (U) In accordance with reference (k), ensure their units' security.

(b) (U) Respond to tasking as directed by CCGDFIVE.

(c) (U) Set threat conditions when ordered by higher authority. See Chapter 5 of reference (k).

(d) (U) Assist Coast Guard Incident Commanders conducting terrorism response operations, if requested.

(3) (U) COMMANDING OFFICERS, CCGDFIVE VESSELS (including VESSELS UNDER CCGDFIVE OPCON) shall:

(a) (U) In accordance with reference (k), ensure their units' security.

(b) (U) Respond to tasking as directed by CCGDFIVE.

(c) (U) Set threat conditions when ordered by higher authority. See Chapter 5 of reference (k).

(d) (U) Assist Coast Guard Incident Commanders conducting response operations, if requested.

(4) (U) COAST GUARD DISTRICT FIVE SECTOR COMMANDERS, as Coast Guard TRC/IC for crisis management operations, shall:

(a) (U) Assume tactical control (TACON) of assigned forces to perform the assigned response operation.

(b) (U) Ensure their units' security in accordance with reference (k).

(c) (U) As appropriate, establish safety and/or security zones for the protection of persons, vessels, and/or property.

(d) (U) Respond to tasking as directed by CCGDFIVE.

(e) (U) Set threat conditions when ordered by higher authority, and direct subordinate units to set threat conditions. See Chapter 5 of reference (k).

(f) (U) Coordinate the operations of responding Coast Guard forces for incidents within the AOR and not under Fifth District OPCON.

(g) (U) Assist Coast Guard Incident Commanders conducting response operations, if requested.

(h) (U) Upon request and as operations permit, provide assistance to other Federal, state, and local authorities conducting terrorism response operations. Coordinated with the appropriate Incident Commander, Coast Guard assistance may include:

1. (U) Enforcing safety and/or security zones established by the Captain of the Port.

2. (U) Providing law enforcement and logistic support.

3. (U) Providing personnel to the FBI Crisis Management Team (CMT), Joint Operations Center and/or Incident Commander to facilitate coordination of

Coast Guard assets supporting response operations.

4. (U) Collecting and accounting for evidence found at the scene.

5. (U) Provide, if necessary, a platform for a Regional Command Post (RCP) at or near the incident scene.

f. (U) Coordinating Instructions

(1) (U) All subordinate commands shall be prepared to commence operations without notification from CCGDFIVE or the operational commander.

(2) (U) Execute this appendix:

(a) (U) Upon occurrence of a terrorist incident.

(b) (U) When current intelligence indicates the potential for a terrorist act at, in the vicinity of, or affecting a Coast Guard unit.

(c) (U) When DOJ (FBI), FEMA, DOD, or other Federal, State, or local authorities request Coat Guard counter-terrorism assistance.

(d) (U) When ordered by COMLANTAREA or CCGDFIVE.

(3) (U) Coast Guard Use of Force Policy applies to Coast Guard forces under Coast Guard OPCON. DOD Use of Force Policy applies to forces under DOD OPCON.

(4) (U) The terrorism incident annex to reference (s) establishes policies, procedures, and guidelines for the employment of the Coast Guard when federal forces are committed to terrorist incidents.

(5) (U) If, under emergent circumstances, the Federal Forces Commander requires the TRC to designate a member of his staff as the Federal Forces Coordinator (FFC), strictly adhere to the parameters of reference (g), paragraph 6.b.3.d.

g. (U) Special Guidance

(1) (U) Incident Site / Crime Scene Preservation. In the course of response operations, it is possible that Coast Guard personnel will come into contact with the incident / crime scene. Personnel should make every attempt not to disturb the scene of the incident.

(a) (U) Secure the Scene. Once injured personnel and fatalities have been evacuated from the scene, Coast Guard personnel should, as far as practicable, control site access by establishing a perimeter or security zone. Document, via a log, all personnel who enter the secured area and maintain site control until properly relieved, i.e., until another agency or competent authority assumes site control.

(b) (U) Debriefing by Law Enforcement Officials. As the incident progresses from a response phase to the investigatory phase, response personnel may be asked to provide statements. Coast Guard personnel shall speak only of those activities of which they have first-hand knowledge.

(c) (U) Evidence Collection. Coast Guard personnel may also be asked to assist with evidence collection. The complexity and duration of this task will vary. CCGDFIVE unit commanders shall, operations permitting, provide personnel to assist.

4. (U) Administration and Logistics

a. (U) Concept of Support. Normal channels of logistics and administrative support remain in place; reference (o) applies. ISC Portsmouth will provide support for terrorism / WMD response operations. When requested, ISC Portsmouth will assign personnel to head the logistics / finance section on each Coast Guard Incident Command staff activated within the D5 AOR. All personnel, logistics, and finance requirements shall be coordinated through ISC Portsmouth. CCGDFIVE units will request equipment and supplies that cannot be handled through normal channels via SITREPs to the District. Requests for logistics support beyond District or ISC Portsmouth's capabilities will be forwarded to Maintenance and Logistics Command, Atlantic (MLCLANT) for action.

b. (U) Personnel. As far as practicable, personnel support procedures in reference (o) will remain in effect.

(1) (U) CCGDFIVE shall make to LANTAREA requests for the involuntary recall of Selected Reserve personnel. See Appendix 7 to Annex E to this OPLAN for sample messages.

(2) (U) CGDFIVE commands requiring additional operational or support personnel shall make requests to CCGDFIVE (IMT) via the chain of command. This includes requests for personnel to backfill for active duty personnel reassigned TAD. CCGDFIVE will work with ISC Portsmouth to coordinate these requests. CCGDFIVE (IMT) will consolidate requests

to MLCLANT for additional personnel that are beyond District or ISC Portsmouth's capabilities.

(3) (U) If threat conditions are sustained for an extended period, local units may require additional personnel to maintain expanded security watches.

(4) (U) Redeployment of active duty and reserve personnel may be required to maintain primary Coast Guard mission capability. Coast Guard Selected Reservists and Auxiliarists may be used to backfill the active duty personnel involved in response operations.

(5) (U) For additional information, see Annex E to this OPLAN.

c. (U) Funding. MLCLANT may track extraordinary expenditures for terrorism / WMD response operations in a separate account for potential reimbursement; therefore, Incident Commanders shall submit financial reports with sufficient detail to facilitate such tracking. See Annex D to this OPLAN and references (o) and (p). Guidance will be available from MLCLANT.

d. (U) Public Affairs

(1) The Fifth District is responsible for coordinating all public affairs activities. CCGDFIVE will deploy public affairs staff (officers and petty officers) to assist the Coast Guard Incident Commander, as necessary. See Annex F to this OPLAN for additional information.

(2) Media coverage is important to terrorists attempting to incite public fear or gain attention for their cause. The principal public affairs objective related to terrorism counter-action is to limit the media exposure terrorists seek.

(3) (U) Public affairs staff should:

(a) (U) Identify terrorist activities as criminal acts not justifying public support.

(b) (U) Support the lead agency's public affairs strategy regarding the release of information pertaining to counter-terrorism plans, operations, or response force makeup.

(c) (U) Use pool reporters to minimize intrusions at the scene.

(d) (U) Limit the use at the scene of high intensity lighting, obtrusive camera equipment, and other special newsgathering technologies.

(e) (U) Limit media requests for interviews with barricaded or hostage-holding subjects or other incident participants.

(f) (U) Restrict and/or limit the distribution of information that would:

1. (U) Inflame or aggravate the situation.

2. (U) Compromise official tactical planning or law enforcement efforts.

3. (U) Disclose the incident location when it is not likely to become public knowledge and when the potential for the incident to grow or spread is high.

4. (U) Emphasize the spectacular qualities of the incident or the presence of spectators.

(g) (U) Assure that self-serving statements by the subjects are fairly balanced with contrasting information from official sources reflecting the risks to innocent persons the incident has created.

e. (U) Administrative Reports

(1) (U) Situation Reports (SITREPs)

(a) (U) Coast Guard units assisting with counter-terrorism operations shall, to keep CCGDFIVE informed, submit SITREPs at least twice daily, at 1100Z and 2300Z, or as directed.

(b) (U) Coast Guard forces assigned to a DOD task force shall submit reports in accordance with the DOD task force commander’s direction.

(2) (U) After Action Reports. Subordinate commands shall submit after action reports/lessons learned within 30 days following the conclusion of terrorism / WMD response operations. These reports shall be submitted to CCGDFIVE in accordance with Annex W of this OPLAN.

f. (U) Safety

(1) (U) Detection and Protection. Coast Guard personnel responding to terrorist incidents, including those involving WMD, assume a great risk of exposure to incapacitating or lethal chemical agents, a hazardous situation, or direct tissue contact with extremely infectious organisms. Accordingly, early detection of and protection from the effects of such toxic agents is vital for personnel safety. If possible, Coast Guard personnel should defer the response to specifically trained and equipped Federal, state, local, or private organizations.

(2) (U) Environmental Protection Agency (EPA) Environmental Response Team (ERT). The EPA ERT has the capability to conduct on-site health and safety assessments (including chemical, biological and physical treatment and monitoring) to determine if immediate threats to personnel safety exist. Coast Guard commanders who have reason to suspect threats to physical safety exist shall contact the ERT via the National Response Center (NRC) at 1-800-424-8802.

(3) (U) Personnel Protective Equipment. See paragraph 4.c. to Appendix 26 and Tab A to Appendix 9 to Annex D.

g. (U) Meteorological and Oceanographic Support Services. See Annex H to this OPLAN.

5. (U) Command and Control

a. (U) Command Relationships

(1) (U) For terrorism/WMD response operations, the operational chain of command will flow from CCGDFIVE to the Coast Guard Commanders designated as Incident Commanders. Sector Commanders (or Sector Field Office Commanders) shall be pre-designated Coast Guard Incident Commanders for terrorism / WMD response operations within each geographic area.

(2) (U) Coast Guard elements assisting other Federal, state, and local authorities will remain under Coast Guard OPCON.

(3) (U) Coast Guard elements committed to terrorism / WMD response operations may be under the operational control of an assigned task force commander. Assignment of Coast Guard resources to a DOD task force requires Commandant approval. COMLANTAREA and/or CCGDFIVE will coordinate.

(4) (U) CGDFIVE units shall make requests for logistics and personnel support directly to ISC Portsmouth.

(5) (U) For all other operations, the normal chain of command will be followed. All normal reporting requirements (MOVREPS, etc.) shall be followed in addition to requirements contained herein.

(6) (U) See Annex J to this OPLAN for additional information.

b. (U) Command Posts

(1) (U) The Fifth District command center is located in Portsmouth, VA. CGDFIVE will establish an Incident Management Team (IMT) for response operations, as necessary.

(2) (U) For Coast Guard operations, Sector / Sector Field Office or other command locations shall be used. Coast Guard Incident Commanders shall include command post locations in their supporting plans. Command posts may be moved to facilitate response operations. Keep CCGDFIVE informed of command post establishment or relocation.

(3) (U) Coast Guard mobile command posts may be established, and response operations may be integrated with civil command posts, as necessary, to facilitate command, control, and coordination of multi-agency response assets.

c. (U) Succession to Command. The Coast Guard Incident Commander may be changed, with the approval of CCGDFIVE, during the course of the response operation.

d. (U) Command, Control, and Communications

(1) (U) LANTAREA / CCGDFIVE may impose MINIMIZE in the affected area when response operations begin.

(2) (U) Transportable Communication Centrals (TCC) are available from LANTAREA / CGDFIVE for use as emergency command centers. All requests for contingency communication assets will be in accordance with reference (o).

(3) (U) For additional information, see reference (o) and Annex K to this OPLAN.

TAB A – Terrorism Response Organization and Responsibilities of Operations Groups

TAB X - Terrorism Response Check List

COMMANDER
FIFTH COAST GUARD DISTRICT
431 CRAWFORD STREET
PORTSMOUTH, VA 23704-5004

24 July 2009

TAB A TO APPENDIX 29 TO ANNEX C TO CCGDFIVE OPLAN 9750-09 (U)
TERRORISM RESPONSE ORGANIZATION AND RESPONSIBILITIES OF OPERATIONS GROUPS (U)

(U) REFERENCES:

(a) COMDTINST M16000.12 (series), Marine Safety Manual, Vol. VI, Port and Waterways Safety
(b) COMDTINST M16000.12 (series), Marine Safety Manual, Vol. VII, Port Security
(c) COMDTINST M16247.1 (series), Maritime Law Enforcement Manual
(d) COMDTINST M3010.12B, Contingency Preparedness Planning Manual, Volume II

1. Response Organization. A terrorist incident is likely to draw significant attention, bring many different organizations together, and call for the establishment of an incident command organization. See Appendix 5 to Annex J.

   a. (U) Duty Descriptions and Responsibilities of Response Personnel. See Appendix 7 to Annex J.

2. (U) Operations Section of the Incident Command. Use of the incident command system requires the operations section to be tailored to the operation at hand. For terrorism response operations, establishing the following groups is recommended.

   a. (U) Terrorism Response Group. This group carries out the tactical response and directly supports the operation by assisting other Federal, state, and local agencies responding to the incident. Small boats and vessels provide transportation to the scene and serve as operating platforms while on scene.

   b. (U) Law Enforcement Group. This group can provide security to the responders and at the scene. Forces maintain the integrity of the zone against intrusions, intentional or unintentional. See references (a), (b), and (c).

   c. (U) Physical Security Group. This group patrols designated perimeters and controls access to the unit. Persons desiring to enter should be identified and reported to the command. See references (a), (b), and (c).

d. (U) Medical Group. The Medical Group conducts victim triage, provides first responder care, and coordinates transport to a casualty collection point or directly to a medical facility. This group will work closely with local emergency medical services personnel.

3. (U) General Duties of Groups. Groups shall:

a. (U) Obtain a briefing from operations / command center to determine specific tasking prior to getting underway.

b. (U) Know the identity of other assets employed in the area.

c. (U) Remain under the tactical control of the operations / command center while assigned.

d. (U) Ensure methods of communications – plan, modes, equipment, frequency plan, etc. – are understood.

e. (U) Coordinate activities with adjacent assets.

f. (U) Inform the operations / command center regarding events, occurrences and activities. Report special occurrences or activities (e.g., accidents) immediately.

g. (U) Advise the operations / command center of any changes in status of assigned resources.

TERRORISM / WMD RESPONSE OPERATIONS CHECK LIST (U)

(U) REFERENCES:

a. COMDTINST M5530.1 (series), Physical Security Program
b. COMDTINST M16000.12 (series), Marine Safety Manual, Vol. VII, Port Security

1. (U) This tab lists incident-specific actions to be taken during terrorist / weapons of mass destruction response operations. These actions are not all inclusive. Coast Guard commands shall evaluate the steps necessary to physically secure units in the event of a terrorist threat (barriers, security lighting, etc.). These preparations and courses of action will be reviewed and updated periodically to ensure all necessary preparations are included. Counter-terrorism measures will be implemented with a view to contain and stabilize the incident prior to arrival of the lead agency's representatives.

   During a stand-off (e.g., hostage-taking) or gesture-type (e.g., bombing) terrorist incidents, Coast Guard forces will support the FBI’s counter-terrorism actions.

   For each action, commands or staffs responsible appear within brackets.

ALL	All units involved in response operations
CCGDFIVE	Commander, Fifth Coast Guard District
CGIC	Coast Guard Incident Commander
Dcs	District Five Chief of Staff
Dri	District Five Intelligence
Drmc	District Five Command Center
IMT	Incident Management Team
ISC	Integrated Support Command

2. (U) Awareness Phase

   a. (U) Receive initial incident notification; record information; notify chain of command. [ALL]

b. (U) Command Center: notify and brief Chief of Staff and (Ai) Division Chief on threat / incident. [drmc]

c. (U) Notify the Federal Bureau of Investigation of the threat received. Provide as much information as possible. [ALL]

d. (U) Determine the threat. Determine the steps that can be taken to gather additional threat analysis information. [dri]

e. (U) Obtain an estimate of terrorist intentions and capabilities. [dri]

f. (U) Determine if the threat has local, regional, or national implications. [dri]

g. (U) Assess the need for additional physical security, both short and long-term. [ALL]

h. (U) Assess the need for additional assets: surface, air, communications, and personnel. [ALL]

i. (U) Consider requirements for weapons, equipment, and/or additional security personnel. [ALL]

j. (U) Brief all hands; advise them of the situation and what information may be passed on to dependents. Notify unit Ombudsmen; keep them apprised of situation. Their network provides a flow of information between families and the Ombudsmen coordinator without interrupting official communications. [ALL]

k. (U) Secure classified material. [ALL]

l. (U) Safeguard essential records. [ALL]

m. (U) Set appropriate THREATCON. [ALL]

n. (U) Review bomb threat procedures. [ALL]

3. (U) Initial Response Phase

a. (U) Consider activating the Incident Management Team (IMT) if the incident is of large magnitude and may last several days. [dcs]

b. (U) Act to contain the incident (e.g., establish safety or security zone(s), dispatch response forces, etc.). [CGIC]

c. (U) Notify civil response agencies and request emergency assistance from local responders (fire, police, medical, etc.). [ALL]

d. (U) Notify the chain of command and CGHQ Command Center of the incident by the fastest means possible (i.e., via Critical Incident Communications (CIC) procedures). Follow-up with a SITREP at first opportunity. [CGIC]

e. (U) Raise the THREATCON. Request additional personnel and assets, as required, via the chain of command. Activate Regional Command Post, request PAO assistance. [CGIC]

f. (U) Gather information and documentation to assist the Incident Management Team's response. [CGIC]

g. (U) Notify chain of command of impacts on mission capability. [CGIC]

h. (U) Establish communications link pending arrival of the lead agency. The Coast Guard point of contact will be a mature senior petty officer or junior officer. THE POC MUST BE SUFFICIENTLY JUNIOR TO AVOID GIVING TERRORISTS THE IMPRESSION HE CAN SPEAK FOR THE COAST GUARD OR FEDERAL GOVERNMENT. See reference (a), paragraph 6.B.4.b.(6). [CGIC]

4. (U) Negotiation Phase

a. (U) Support the lead agency's negotiation team (with boat or air transport and communications). [CGIC]

b. (U) Direct Coast Guard action in cooperation with the Federal Forces Commander (FFC). [CGIC]

c. (U) Through the Coast Guard Incident Commander: [ALL]

(1) (U) Maintain the waterside perimeter.

(2) (U) Provide logistic support to the Federal Forces Commander (FFC) as appropriate.

d. (U) During this phase, the Incident Management Team will direct the planning for an assault, if negotiations fail. The assault phase will commence only upon decision of the lead agency's representative. Ensure the qualifications and limitations of Coast Guard personnel are communicated to the Federal Forces Commander (FFC) prior to employment of Coast Guard personnel in any capacity. [CGIC]

5. (U) Assault Phase

a. (U) Support the Federal Forces Commander's designated assault personnel, if requested. The lead agency will coordinate all planning among organizations that may be involved in any assault. [CGIC]

6. (U) Incident Conclusion Phase

a. (U) See to the well-being of hostages by providing or arranging emergency medical care, transportation to medical facilities, notification of relatives, and other ancillary services if requested by Incident Management Team. [CGIC]

b. (U) Assist the lead agency to contact Explosive Ordnance Disposal team(s), if necessary. [CGIC]

c. (U) Provide necessary demobilization support, including refueling and re-provisioning of Coast Guard resources, with capture of costs. [CGIC]

d. (U) Provide other support and conduct debriefings and case documentation if requested by the Incident Management Team. See reference (a), paragraph 6.b.4.e. [CGIC]

e. (U) Provide lessons learned to CCGDFIVE within 45 days. [CGIC]

f. (U) Working with the Integrated Support Command, capture extraordinary costs for possible FEMA reimbursement if the National Response Plan is activated. [IMT]

SDB Volunteer Use Plan

Sector Delaware Bay – Volunteer Use Plan

1000 Volunteer Use

This document provides a Volunteer Coordinator, Volunteer Unit Leader, or Volunteer Officer, as decided upon by the FOSC and UC, basic guidance in volunteer use and management during an oil spill. However, it is applicable in all any hazard type response. In addition to this section, the Incident Commander/Unified Command (IC/UC) may refer to any guidelines developed by National Response Team (NRT) for volunteer use.

A volunteer is any individual accepted to perform services by the lead agency which has authority to accept volunteer services. The decision to accept volunteer services, affiliated or unaffiliated, is made by the IC/UC. The Sector Delaware Bay, Federal on Scene Coordinator (FOSC) may use the services of volunteers in accordance with his/her authorities when determined to be appropriate. The IC/UC will make that decision on a case-by-case basis; weighing the interest of the local volunteer community; benefit of volunteer efforts against health and safety concerns; resources needed for volunteer supervision and training; the concerns of a Responsible Party (RP), and other relevant issues. If the incident includes a RP, the input of the RP regarding the use of volunteers should be given strong consideration, but ultimately, the FOSC (along with any state or local commanders in the IC/UC) may make the decision to accept volunteers even if the RP objects. However, the FOSC should consult his/her agency counsel if considering using volunteers on the RP's property in order to determine the applicability of federal liability coverage to those volunteers. Useful definitions are below:

- **Affiliated Volunteer**: An individual who comes forward following an incident to assist with response activities during the response or recovery phase without pay or other consideration and has a pre-existing formal or informal arrangement with either a governmental agency or non-Governmental Organization (NGO) and who has been trained for a specific role or function in incident response or disaster relief during the preparedness phase.
- **Unaffiliated Volunteer**: An individual who comes forward following an incident to assist a governmental agency or NGO with response activities without pay or other consideration. Unaffiliated volunteers are also sometimes referred to as "Convergent," "Emergent," or "Spontaneous". By definition, unaffiliated volunteers are not initially affiliated with a response or relief agency or pre-registered with an accredited disaster council.
- **Employee**: An "employee" is described for each agency in specific laws and regulations. These laws and regulations can vary across agencies. These requirements may also specify to what extent an agency may accept volunteer services and to what extent volunteers may be considered "employees" of that agency for specific purposes, such as work hours and compensation for injuries.

It is recognized that the presence of affiliated and/or unaffiliated volunteers may be a challenging management issue for the IC/UC. Due to the logistical requirements of coordinating and training volunteers, the response organization must be large enough to support volunteer participation. That is why the use of volunteers, or using every person that volunteers for a response, may not be appropriate during all incident responses.

It is also important to note that USCG and EPA have different authorities to use volunteers. Depending on whether the USCG or the EPA is providing the federal OSC for a specific incident, the relevant agency's authorities to use volunteers would apply and need to be considered by the IC/UC. Therefore, the decision to use or keep volunteers engaged in a response could change if the lead federal agency changes.

2000 Volunteer Management

Depending on the interests of the volunteer community, the media, and the public, the IC/UC may decide to manage volunteers by assigning a Liaison Officer (LNO), or a designated Volunteer Officer (VO), a Volunteer Coordinator (VC) under the Resource Unit, or establishing a Volunteer Unit. The Sector

Liaison Officer (LNO) will generally be the first to receive external reports of volunteer interest due to the outreach responsibilities of that position. If volunteer interest exists, the LNO will advise the IC/UC. It is recommended that a Federal or State Agency Representative fill the selected management position (Volunteer Officer, Volunteer Coordinator, or Volunteer Unit Leader). Additionally, a representative from the Corporation for National and Community Service (CNCS) could be called upon to fill the volunteer manager's role. Ensure that the Finance Section Chief is aware that the CNCS is being requested by the IC/UC as the Finance Section would prepare the Pollution Removal Funding Authorization (PRFA) for obtaining CNCS representative. Interested unaffiliated volunteers may be encouraged to join affiliated volunteer organizations. However, the USCG, nor the Sector Delaware Bay Area Committee, nor any other federal or state governments, endorse one organization over another. Once volunteers are processed into the response organization, they may be assigned directly to an appropriate unit in the Operations Section, Planning Section or other appropriate section within the Response Incident Command System. If, and as necessary, they may be trained, provided safety and/or protective equipment, and be informed where, when, and to whom they should report.

Volunteers that do not possess required training will not be permitted to participate in UC sanctioned response activities. Volunteers will not be used in the physical removal of oil and or hazardous substances from the environment.

In some incidents, state or local governments or NGOs may be prepared to establish a volunteer operations or reception center to be the focal point for unaffiliated volunteer recruitment, registration, orientation, and training. The Volunteer Manager (Volunteer Officer/Coordinator/Unit) would be responsible for coordinating with the volunteer operations center established by another organization. If the response will include significant numbers of unaffiliated volunteers but states/locals do not have this capability, it may be advisable for the IC/UC to have the Volunteer Officer/Coordinator/Unit work with Logistics to establish a temporary federal volunteer operations center for these purposes. This center would provide a location separate from the ICP for volunteers to converge and prepare to deploy. If a center is established by the IC/UC, the Volunteer Officer/Coordinator/Unit would work with the Resource Unit to have appropriate personnel and resources assigned to manage and staff the center. The IC/UC should assign a federal or state official to manage the volunteer center.

3000 Volunteer Management Responsibilities

Regardless of how volunteers will be managed (Volunteer Officer; Volunteer Coordinator under the Resource Unit; or by a Volunteer Unit in the Planning Section), management responsibilities include but are not limited to the following:

- Provide a point of contact for all volunteers as well as for all units/agencies needing volunteers;
- Establish a communication system, including the use of toll-free phone numbers, emails, cell phones, a website, and social networking tools. Recruitment of an Amateur Radio Operator should be considered for remote locations.
- Process all volunteers interested in assisting the response organization [Link to Volunteer Information Form 9725];
- Ensure volunteers are identified and documented;
- Develop a cost/benefit standard for selecting volunteers that provides the maximum benefit to the response at minimum cost. For example, a volunteer that can fill an assigned role for a longer period of time after training, is more beneficial to the response organization than a volunteer who can only contribute a few hours after completing training.
- Develop a volunteer participation standard. Depending on the volunteer's assignment, criteria includes but is not limited to the following:
    - Minimum volunteer age.
    - Minimum health condition (no reparatory or immuno-compromising illnesses).

    - Proof of current tetanus inoculations.
    - Current driver's license, registration, and proof of insurance if transporting, personnel, wildlife, or equipment in one's personal vehicle or vessel.
    - Minimum health condition (no respiratory or immuno-compromising illnesses).
- Create a credentialing system allowing designated volunteers access to the scene. This may come in the form of accountability tags, wrist bands, a letter from the FOSC, or a picture ID. Some RPs may have developed their own credentialing system. The system to be used will be developed and implemented on a case by case basis.
- Prepare Organizational Assignment List (ICS 203) and prepare or obtain Organizational Charts (ICS 207) for the Affiliated Organizations
- Provide briefings to supervisors on the status of volunteer interest, use, and management.
- Provide briefings to volunteers on the current incident situation and response organization expectations.
- Coordinate with the Public Information Officer (PIO) or Joint Information Center (JIC) to provide media with types of volunteer jobs available and the process to volunteer.

4000 Affiliated Agency and/or Volunteer Manager Responsibilities

Volunteers will either regard their participation in the response as rewarding or frustrating based upon their personal experiences. It is imperative that they be safely utilized, and their needs are met. Some of the responsibilities of agencies or response supervisors that are managing volunteers include but are not limited to:

- Be respectful and provide an environment in which the volunteer can work.
- Provide proper briefings to the VO, VC, Volunteer Unit Leader.
- Oversee operations as assigned.
- Provide and ensure the proper use of PPE.
- Ensure health and safety of volunteers.
- Ensure that logistics requirements are met.
- Maintain all required documentation.
- Maintain volunteer credentialing.
    - Track volunteers.

5000 Volunteer Participant Responsibilities

Once a volunteer has accepted an assignment, it is imperative that the volunteer take the assignment seriously. Assigned volunteers will be told where, when, and to whom to report. The volunteer will have to agree to standard work conditions and Code of Conduct for the benefit of the response and for his or her own safety. If a volunteer or volunteer agency becomes a distraction, the volunteer or volunteer agency will be asked to discontinue their participation in the response. Some of the responsibilities of volunteers include but are not limited to:

- Complete all "worker" information forms.
- Realistically evaluate their ability to participate in the response.
- Arrive where and when they are supposed to and check in.
- Be respectful to others.
- Refrain from alcohol or illegal drug use.
- Immediately report any injuries, exposures, illness, or insect or animal bites to a supervisor.
- Immediately report any broken or lost equipment to their supervisor. Immediately report any hostile work conditions to their supervisor or the Safety Officer.

- Report to their supervisor when they are departing and if they will not be returning for their next scheduled Operational Period.

6000 Volunteer Liability and Considerations

In many cases, the Responsible Party (RP) is responsible for the funding of the response. In this active role, it is critical that their concerns and limitations on using volunteer organizations are considered. Often RP's are hesitant to utilize volunteers due to liability and legal considerations. However, the advantages and disadvantages will be discussed and decided upon by the IC/UC, with advice from legal representatives. If a unilateral Coast Guard IC or UC decision is made to use affiliated or unaffiliated volunteers, the RP generally has no regulatory obligation to provide support or management resources.

Often, when affiliated volunteers are used, the volunteers are covered under the affiliated organizations' liability coverage. The Oil Spill Liability Trust Fund (OSLTF) is available up to 50 million dollars annually for federal response costs under the Clean Water Act. The OSLTF may be used to pay for volunteer expenses consistent with this authority. FOSCs should communicate with the Coast Guard Commandant office of CG-533 and the National Pollution Funds Center when dealing with issues regarding funding for volunteers.

State requirements for Volunteer Management can be provided by or within

- New Jersey: State Incident Commander
- Delaware: State Incident Commander
- Pennsylvania: [Link to: PEMA Directive 2006-1 – Official Enrollment of State Emergency Management Volunteers]*

* These resources are available for general disaster response, but some may be available for support during oil spill response operations.

7000 Health and Safety Training Standards Needed for Volunteer Participation

Elements of required and recommended training will vary depending on the tasks of the individuals involved in the response. Training requirements and specific courses vary with level of involvement, agency policy, UC requirements, OSHA and state regulations. Volunteers that do not possess the required training will not be permitted to participate in UC sanctioned response activities. Generally, volunteers who respond to an oil spill incident will not be used in the physical removal of the hazardous substance. The acceptable level of training is outlined below:

- Managers or supervisors of volunteers shall meet the state and Occupational Safety and Health Administration (OSHA) requirements for the area where they will be used and for the position which they will fill. The National Contingency Plan (40 CFR 300), Appendix E, paragraph 6.0, addresses the use of volunteers and OSHA pamphlet 3172 outlines the training required.

Although volunteers are not employees of the federal government, state governments, responsible party, or volunteer organizations, they will be considered workers and will be required to complete or possess required hazardous substances, safety, and health hazard training per 29 CFR 1910.120(e) if participating in hazardous waste operations (HAZWOPER). This regulation dictates that post-emergency response workers engaged in hazardous substance removal or other activities which expose or potentially expose workers to hazardous substances and health hazards shall receive a minimum of 40 hours of HAZWOPER training. These 40 hours of training would be difficult and expensive to set up for volunteers. Instead, volunteers can fall under a "De Minimis" exception. Under OSHA Directive CPL 2-2.51 and OSHA Standards Interpretation and Compliance Letters (dated 02/13/1992), "a minimum of four hours [of training] would be appropriate in most situations." The criteria for De Minimis are:

- The job site is in an area where a qualified person has decided that the exposure potential is expected to remain under Permissible Exposure Limits (PEL),
- Health risks from skin absorption are minimal;
- Workers have been trained on procedures in the event of an emergency and hazards associated with the hazardous substance in the workplace;
- Workers have completed training including topics such as decontamination procedures, heat stress, hypothermia, water safety, and operating procedures; and,
- Supervisors have received a minimum of 24 hours of training.

It is the intent of the UC to keep volunteers away from the hazardous substances: however, there may be a time when certain volunteers possess unique skill sets that warrant potential contact with the hazardous substance. The minimum training required for volunteers involved in removal operations should be consistent with the hazardous waste operations standards set forth in 29 CFR 1910.120(e) and (q). If select volunteers are deemed appropriate by the UC to further their services and wish to take a more direct role in spill response operations, they will have to meet the requirements listed below:

- **29 CFR 1910.120(e)(1)(i)** states that all employees working on site (such as but not limited to equipment operators, general laborers and others) exposed to hazardous substances, health hazards, or safety hazards and their supervisors and management responsible for the site shall receive training meeting the requirements of this paragraph before they are permitted to engage in hazardous waste operations that could expose them to hazardous substances, safety, or health hazards. They shall receive review training as specified in this paragraph.
- **Management and supervisor training, 29 CFR 1910.120(e)(4):** On-site management and supervisors directly responsible for, or who supervise employees engaged in hazardous waste operations shall receive 40 hours initial training, three days of supervised field experience (the training may be reduced to 24 hours and one day if the only area of their responsibility is employees covered by paragraphs (e)(3)(ii) and (e)(3)(iii)), and at least eight additional hours of specialized training at the time of job assignment. Specialized training will include topics such as, but not limited to, the employer's safety and health program and the associated employee training program, personal protective equipment program, spill containment program, and health hazard monitoring procedure and techniques.
- **General site workers, 29 CFR 1910.120(e)(3)(i):** General site workers require 40 hours of instruction off the site and a minimum of three days actual field experience under the direct supervision of a trained, experienced supervisor. Volunteers should not be put in situations where they would be considered a general site worker.
- **Occasional site workers, 29 CFR 1910.120(e)(3)(ii):** Occasional site workers require 24 hours of instruction off the site, and a minimum of one day actual field experience under the direct supervision of a trained, experienced supervisor. An example of this category worker is a field observer.

Note: Some states have federally approved state plans outlining health, safety, and training requirements based on HAZWOPER standards. These states are called State-Plan states. New Jersey is a State Plan state but its Plan covers public sector employment only. Pennsylvania and Delaware are not State Plan states. State Plans and their volunteer safety training standards shall have precedence since these plans are approved by OSHA. If volunteer tasks do not require HAZWOPER training, such training should not be conducted or mandated. A list of State-Plan states and POCs can be found at: http://www.osha.gov/dcsp/osp/index.html.

8000 Safe Use of Volunteers

The assignments provided to volunteers should be “low risk”. In certain circumstances, volunteers may be used for “higher risk” activities. Common uses of volunteers for man-made or natural disasters include

activities such as wildlife cleaning, or removal of beach or shoreline debris. These activities, however, require specialized training and in some cases licensing. The National Oil and Hazardous Pollution Contingency Plan (NCP) 40 CFR 300 discourages volunteer participation in physical removal activities and limits them to non-hazardous tasks due to the extensive medical surveillance, training and equipment required to participate in physical removal activities. Sector Delaware Bay's policy is that volunteers shall not have direct contact with oil or other hazardous substances. However, volunteers may be used to support the following pre-designated activities with IC/UC approval:

Habitat Surveyor: Volunteers may be deployed to assist in the habitat survey of pre and post spill shoreline and riverbank wildlife. Interested volunteers must be able to identify oil on the ground, structures, or on plants versus a non-oiled environment, have a valid driver's license, be familiar with the local area, and must attend HAZWOPER training.

Pre-impact Shoreline and Riverbank Cleanup: Volunteers may be deployed to assist with the ongoing pre-event maintenance and clean-up of coastal areas in an effort to minimize the potential amount of contaminated debris. Interested volunteers must be physically capable of walking, stooping, lifting, and carrying debris repositories. Volunteers must also be very familiar with the local area without the use of street signs, have a valid driver's license and must attend incident specific USCG orientation.

Delivery / Runners: Volunteers may be deployed to carry supplies, transport personnel, and other associated duties as assigned, to and from oil-impacted areas or other locations. Interested volunteers must be in good physical condition, have a valid driver's license, be very familiar with the area without the use of street signs, and must attend incident specific USCG orientation.

Coast Watcher: Volunteers are community members who are very familiar with local beaches and can report any changes that may be attributed to the oil spill incident. Interested volunteers must be familiar with the local area and attend an on-site safety training program.

Volunteer Coordination: Volunteers may be deployed to set up and manage a Volunteer Reception Center (VRC) or Volunteer Congregation Site. Interested volunteers need experience in dealing with convergent, unaffiliated volunteers. Volunteers must also be in good physical condition, have a valid driver's license, be very familiar with the local area, and must attend incident specific USCG orientation as well as three hour VRC training.

Wildlife Recovery and Rehabilitation: Volunteers may be deployed to assist professional organizations such as Tri-State Bird Rescue and Research in wildlife recovery and rehabilitation. Often these organizations are hired by the RP and work closely with the U.S. Fish and Wildlife Service and similar state agencies. Volunteers must fulfill training required by these organizations.

9000 Affiliated Volunteer Organizations

Interested unaffiliated volunteers may be encouraged to join affiliated volunteer organizations. However, the Sector Delaware Bay Area Committee federal and state governments do not endorse one organization over another. Affiliated volunteer organizations that may be called on to support response operations include but are not limited to:

- Tri-State Bird Rescue & Research 302-737-7241
- The Marine Mammal Stranding Center, Brigantine, NJ 609-266-0538
- Marine Education, Research & Rehabilitation Institute, Nassau DE 302-228-0529
- The DelawareRiverKeeper Network 215-369-1188
- U.S. Coast Guard Auxiliary

10000 Not Recognized Volunteers

There may be cases where the RP and UC determine that select Affiliated volunteers will be recognized and included in a response. However, at the same time, the RP and UC may wish to "discourage" other Affiliated and Unaffiliated volunteers from participating in the response. The official position would be

the volunteers are “not recognized” and therefore, are officially not part of the response. However again, the volunteers (or their organization(s)) that are not recognized, may be gathering critical information as part of their normal interests in protecting the waterways. These volunteers may wish to provide that information to the response organization. In cases as described, the volunteers can gather the information and pass the information to a Liaison Officer, Volunteer Manager, or the Environmental Unit Leader. It is important to emphasize, however, that the “officially not recognized” volunteers are not part of the response organization and therefore, the federal, states, local governments, and Responsible Party nor their employees, have any responsibility or liability for any injury or death incurred by the volunteers who are not recognized as part of the response.

Annex UU

Radiological Incident Annex

Radiological Incident Annex

Radiological Incident Annex – Sector Delaware Bay

Introduction

The Coast Guard's jurisdiction as the Coordinating Agency[1] for a radiological incident is limited in both geographic area and authority.

Figure 1, illustrates the two most important criteria (jurisdiction and terrorism) that determine the Coast Guard's role as either a Coordinating Agency or as a cooperating agency during a radiological incident.

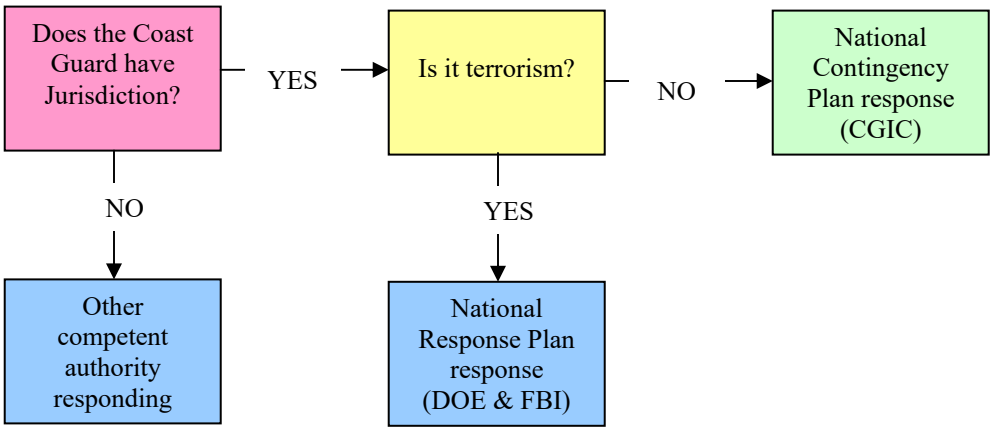

Figure 1. In radiological incidents where the Coast Guard has jurisdiction and there is no involvement of terrorism the Coast Guard Incident Commander responds under the NCP. For any radiological incidents where terrorism is involved, the Department of Energy is the Coordinating Agency responding under the NRP and the Coast Guard is a cooperating agency.

Purpose

The purpose of this Annex is to provide guidance to the Coast Guard Incident Commander (CGIC) and their Maritime Security and Area Committee partners in responding to radiological incidents that have actual, potential, or perceived radiological consequences.

A radiological incident involves the release or potential release of radioactive material that poses an actual or perceived hazard to public safety, national security and or the environment.

The role of the Coordinating Agency for radiological incidents in the maritime environment can reside with several different federal agencies depending on geographic location, accountability for the radiological source, and the suspected or actual involvement of terrorism.

[1] The Coordinating Agency is that Federal agency which owns, has custody of, authorizes, regulates, or is otherwise deemed responsible for the radiological facility or activity involved in the incident.

Radiological Incident Annex – Sector Delaware Bay

Coast Guard Jurisdiction [Link to Flow Chart 9780]

The National Response Plan limits the Coast Guard's Coordinating Agency role for radiological incidents to "*certain areas of the coastal zone*" which is defined as radiological incidents that occur on:

- Any type of vessel,[2]
- Waters seaward of the shoreline to the outer edge of the Exclusive Economic Zone,[3] and,
- Specified waterfront facilities[4]
    - For the Captain of the Port Sector Delaware Bay these specified facilities are listed in the following link [Waterfront facilities]

The type of incidents the Coast Guard Incident Commander will respond to are:

- Transportation of radioactive materials
    - Shipment of materials that are not licensed or owned by a Federal agency or Agreement State[5]
- Foreign, unknown or unlicensed material[6]
    - Incidents involving foreign or unknown sources of radioactive material or radioactive material which does not have appropriate licenses
- Space vehicles containing radioactive materials
    - Not managed by DOD or NASA (i.e. commercial satellite)

In addition to geographic limitations, the scope of the Coast Guard's jurisdiction as the Coordinating Agency is limited to those radiological incidents that do not involve a terrorist act.

For any terrorist event involving non-Department of Defense or non-Nuclear Regulatory Commission (NRC) radioactive material, the Department of Energy (DOE) will assume the

---

[2] Vessels as defined in 33 CFR 160.5. Exception: Department of Defense vessels.
[3] Exception: Department of Energy is the Coordinating Agency for radiological material shipped by or for them and for any nuclear weapon in their custody.
[4] Facilities regulated by 33 CFR 105, 126, 127, 128, 140, 154, 155, 156
[5] For non-agreement states such as New Jersey the Coast Guard is the Federal Coordinating Agency and will assist the state if necessary.
[6] **Foreign or unlicensed** source may be a reactor, a spacecraft containing radioactive material, imported radioactively contaminated material, or a shipment of foreign-owned radioactive material. **Unknown** sources of radioactive material, also termed "orphan sources" are those materials whose origin and/or radiological nature are not yet established. These types of sources include contaminated scrap metal or abandoned radioactive material. **Licensed material:** The Nuclear Regulatory Committee (NRC) issues licenses to operators and facilities under the Atomic Energy Act of 1954, as amended, and the Energy Reorganization Act of 1974, as amended. "Licensed material" refers to byproduct, source or special nuclear material associated with these facilities regulated by the NRC. It is most likely that the only way to determine if something is a "Licensed Material" is by contacting the NRC or the Responsible Party (Source NRP).

role of Coordinating Agency to address the radiological aspects of the response [Link to the NRP Nuclear/Radiological Incident Annex]

Using this Annex

Notification of a possible or actual radiological incident can occur in several ways. To facilitate initial actions to be taken and to determine jurisdiction choose the link that matches your method of notification.

- Passive detection from radiation pagers (Level I)
- Intelligence source(s)
- Notification of a radiological release -- NCP response
- Actual terrorist incident involving radiation

Passive Detection (Level I)

A radiological incident may be first discovered while conducting routine operations in the port (discovery may be made by Customs and Border Protection) or through intelligence gathering. The guidance in the Unit's Radiological Response SOP will be used when Level I detection indicates the presence of a radiological source. Depending on the method of discovery and whether the incident is on a vessel or facility, the CGIC should make some initial determinations as to which course of action to take:

- **On a Vessel:** While on board a vessel (underway or moored), if a Level I Team detects either neutron or gamma radiation and has determined that the source is illegitimate or unknown, the Coast Guard Incident Commander, in consultation with the States, should determine the safest location for the vessel to be located. Safe location options are to:
  - If at sea, keep the vessel at sea
  - If vessel is transiting in the port or is moored, direct the vessel to a safe location. Options include: if moored remain at moorings, anchorage, or send out to sea. Take into account the following
    - Proximity to population centers
    - Critical infrastructure
    - Vessel traffic in the vicinity of suspect vessel
    - Ability to get teams on and off the vessel
    - Source is emitting neutrons (may indicate the presence of spent nuclear material)
    - Consult Port of Safe Refuge Document [Link to Port of Safe Refuge]
- **On a Facility:** If a Level I Team detects either neutron or gamma radiation and has determined that the source is illegitimate or unknown while at a facility:
    - Determine whether to limit facility operations adjacent to the isolation perimeter established by the Level I Team

- If source is emitting neutrons may indicate the presence of spent nuclear material (Note: Neutron sources rarely occur naturally and are usually produced in a reactor. Although they are generally associated with special nuclear material (SNM), there are some legitimate sources of neutron radiation).
- In conjunction with the Facility Security Officer evaluate the need to limit access into the facility or evacuate the facility

For both vessels and facilities:
If radiation source is illegitimate, unknown or exceeds the safe exposure limits for a Level I Team, the Level I Team is to notify the chain of command requesting Level II support. Upon receiving the request, Commander Sector Delaware Bay should consider the following:

- ❑ Deploy Level II Team to localize and characterize the radiation source. Level II resources:
  - Atlantic Strike Team
  - Sector Delaware Bay
  - Customs and Border Protection
- ❑ Notify Philadelphia Field Intelligence Support Team (FIST)
- ❑ Contact the Coast Guard Investigative Service (CGIS) Liaison Agent to the Joint Terrorism Task Force (JTTF) to notify the local FBI Office when Level II Team is deployed:
  - Philadelphia
  - Baltimore
  - Newark
- ❑ If necessary, Level II Team to coordinate with CBP Laboratory Scientific Support (LSS).
  - LLS radiological officer 24-hour number is: (407) 975-1780.
- ❑ Notify the State(s)
- ❑ Determine need to shift to secure communications
- ❑ Consider establishing Safety/Security Zones
- ❑ Determine Safe to Respond [Link to Safe to Respond Document]
- ❑ If Level II Team cannot identify the source as legitimate, request assistance from the DOE Radiological Assistance Program (RAP) Team at the Brookhaven Area Office
  - Emergency number (631) 344-2200
  - Notify the National Response Center if RAP support requested
- ❑ Determine need to initiate Critical Incident Communications procedures [Link to Critical Incident Communications Procedures Section 1050]

Intelligence Sources

When the Coast Guard receives notification of possible intelligence regarding a potential radiological incident it is critical to determine if the intelligence is credible.

- Work with the Philadelphia FIST and CGIS to determine if threat is credible or non-credible
  - If credible, support the Department of Energy, which is the Coordinating Agency and the Federal Bureau of Investigation. [Link to Terrorism Incident Annex]
  - If not credible,
    - Does the Coast Guard have jurisdiction? [Link to Section 9780 Flow Chart]
    - If yes, conduct follow-up to determine if there is public health threat

Actual terrorist incident involving radiation

In the event of an actual terrorist incident involving radiation the Coast Guard's role is as a cooperating agency using primarily the authorities of the Captain of the Port. Initial actions to be taken

- Initiate Critical Incident Communications procedures [Link to Critical Incident Communications Procedures Section 1050]
- Account for all field deployed teams, individuals and assets
- If first federal on scene, implement the Terrorism Incident Annex until relieved by the Department of Energy [Link to Terrorism Incident Annex]

Notification of a Radiological Release responded to under the National Contingency Plan

This section of the Annex discusses non-terrorist radiological incidents where the Coast Guard has jurisdiction and where response operations are conducted under the National Contingency Plan.

[Link to Sector Delaware Bay Radiation Incident Report Form]

Unified Command Organization

The actual make-up of the Unified Command in response to a radiological incident conducted under the National Contingency Plan will depend on the incident location and complexity. Figure 2 lists potential agencies and entities that would most likely respond to a non-terrorist radiological incident in the Captain of the Port Sector Delaware Bay zone.

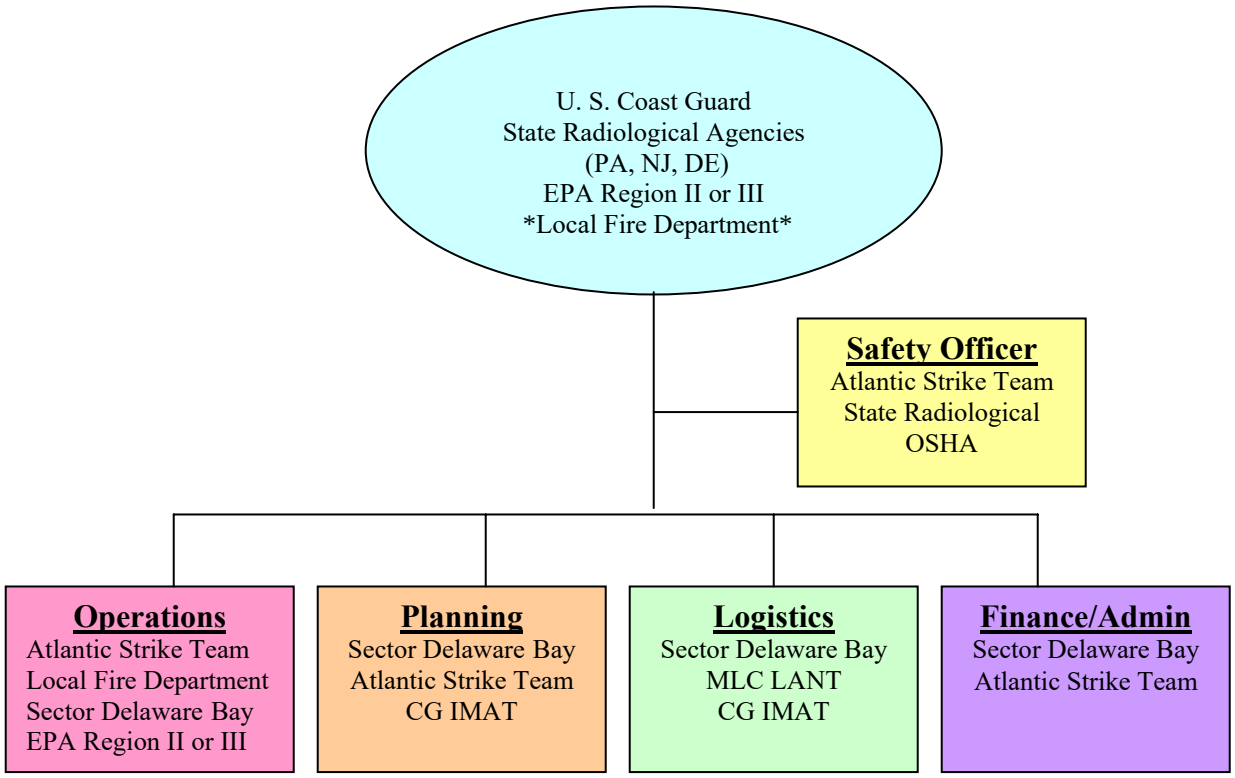

Figure 2. The actual makeup of the Unified Command organization in response to a radiological incident will depend on incident location and complexity. The agencies and entities listed in the ICS organization chart represent those most likely to respond to a radiological incident under the National Contingency Plan in Captain of the Port Sector Delaware Bay zone.

For the Operations Section Chief, consider:

- Complexity of the incident
- Knowledge and experience in responding to radiological incidents
- Agency with the greatest jurisdiction, involvement, and statutory authority

Incident Commander/Unified Command Response Objectives

Incident Commanders/Unified Command should use this Annex in conjunction with the Base Plan [Link to Incident Commander/Unified Command Section 2050] when responding to a radiological incident in "certain areas of the coastal zone."

Local governments are encouraged to contact the Unified Command through the Liaison Officer.

- Ensure the safety of responders through the use of radiation detection equipment and monitoring devices
- Establish incident site control zones (exclusion, contamination reduction zone, support zone) based on active surveillance:
- Determine the extent of the contamination
- Minimize the spread of contamination
- Isolate hazard from the public and non-responders
- Determine need to establish public health monitoring
- Stabilize the source
- Prevent the spread of radiological material from the incident site
- Implement effective communications with state Emergency Operations Centers
- Coordinate incident security
- Access Comprehensive Environmental Response, Compensation and Liability Act (CERCLA) funding
- Ensure coordination of technical data (collection, analysis, storage, and dissemination)

Safety Officer

The two radiation concerns at an incident are exposure and contamination by radioactive material.

- List of hospitals capable of accepting radiation casualities:
  - Delaware [Link to the ICS-206, Medical Plan Section 9704]
  - New Jersey [Link to the ICS-206, Medical Plan Section 9705]
  - Pennsylvania [Link to the ICS-206, Medical Plan Section 9706]

- Conduct active surveillance
  - Air monitoring
  - Visual
  - Ground truthing

Actions that can be taken to minimize exposure involve Time, Distance, and/or Shielding:

- Decrease the amount of TIME spent in close proximity to the radiation source.
- Keep as much DISTANCE away from the source as feasible
  - As a rule of thumb, every time you double the distance away from a radiological source, you reduce the exposure rate by four times.
- Use available means of SHIELDING to lower the amount of exposure to the source.

State Radiological Emergency Contacts

- Pennsylvania Emergency Management Agency
- New Jersey Department of Environmental Protection
- Delaware Emergency Management Agency

Special Teams

The following special teams are equipped to respond to radiological incidents, and should be considered as potential response resources:

- EPA Radiological Emergency Response Team (RERT)
- USCG Atlantic Strike Team (AST)
- DOE Radiological Assessment Program (RAP) Team
- USACE Rapid Response
- NOAA Scientific Support Coordinator
- 3rd Civil Support Team
- Delaware Department of Natural Resources and Environmental Control Radiological Response Team (Level II capable)
- New Jersey Department of Environmental Protection

Additional special teams can be found in the Special Teams Handbook [Link to the Handbook]
For local subject matter experts see:
[Link to Delaware Estuary Science Directory]

Medical Plan for Radiation Incidents

Delaware

9704 Medical Plan for Radiological Incident in Delaware

MEDICAL PLAN	1. Incident Name **Radiation Release Delaware**	2. Date Prepared	3. Time Prepared	4. Operational Period

5. Hospitals

Name	Address	Travel Time Air	Travel Time Ground	Phone	Helipad Yes	Helipad No
Christiana Hospital	4755 Ogletown-Station Rd. Newark, DE			302-733-1000	X	
Wilmington Hospital	501 W.14th St Wilmington, DE			215-481-2000		X

6. Medical Emergency Procedures

- Medical personnel to attend to the needs of personnel suffering from the effects of acute exposure to radiation or whose exposure has exceeded **5 mrems per hour.** Also personnel who have ingested or inhaled radioactive material exceeding 50 % of the TLV should be given an Acute Exposure Exam with the Information entered on the Acute Exposure Form (CG-5447A) and physical examination forms DD 2807-1 and 2808. Document all incident related injuries/illnesses
- Safety and Occupational Health Coordinator (SOHC) and/or Safety Petty Officer will collect the Thermoluminescent dosimeters (TLD film badges) from the Group Supervisors (North, South and Air Ops Safety Zone Group) enforcing the safety zone and the Emergency Worker Radiological Exposure Records immediately following a radiation release incident or in the event that the limits of exposure (**5 mrems per hour)** are exceeded. Send them to the *NJ Radiological Calibration Lab, Princeton, NJ (609-924-5650),* to be read, copies of the Emergency Worker Radiological Exposure Records will be given to the HS1.
- Medical Personnel to evaluate any personnel for acute exposure to radiation levels **5 mrems per hour and above or who have ingested or inhaled radioactive material exceeding 50% of the TLV** and send them to Health Mark at the Methodist Hospital, Broad St. Philadelphia. Any personnel suffering symptoms of acute exposure (i.e. nausea, vomiting, dizziness, burns, etc.) or have been exposed to **radiation levels exceeding 100 mrems per hour** will be immediately sent to the nearest hospital that is able to treat radiation exposure. Levels of exposure will be recorded on the Emergency Worker Radiological Exposure Record.
- In the event of a radiological incident contact the Command Duty Officer (CDO) to gain access to the medical spaces to obtain the Potassium Iodide (KI) tablets. The key to the medical spaces will be kept in lock box at the front desk. The KI tablets will be kept in medical until such an incident occurs. **and will be taken only with the approval of the Sector Delaware Bay Medical Officer.** (*See attachment for instructions in the use and side effects of the KI Tablets.*)
- Communicate any and all loss or degradation of medical services/resources to the Incident Commander (IC)

9704 Medical Plan for Radiological Incident in Delaware

Note: For acute dosages of 5 to 100 mrems per hour there are generally no observable effects, however personnel should be examined for any changes in blood chemistry, 100% recovery expected within 24 hours. For exposure of 100 mrems personnel may experience vomiting, fatigue, loss of appetite and moderate blood changes, 100% recovery expected within one week. Doses of 200 mrems or more will require recovery of up to one year and in some cases could be lethal.

Executive Summary

Over the past decade, finding places of refuge for stricken vessels has become a significant issue deserving the attention of Area Committees, Regional Response Teams (RRTs), and the National Response Team (NRT). In December 2003, the International Maritime Organization (IMO) adopted Resolution A.949(23), *Guidelines on Places of Refuge for Ships in Need of Assistance*. Being a signatory to this agreement, it is incumbent upon the United States through the National Response System to develop protocols and procedures to address places of refuge for vessels in distress.

The IMO resolution was developed in response to three major overseas oil spills; namely, the M/T ERIKA (December 1999), the M/T CASTOR (December 2000), and the M/T PRESTIGE (November 2002). Each of these incidents involved tank ship structural failures at sea. In the case of the ERIKA and PRESTIGE, both tank ships eventually broke apart and sank, releasing millions of gallons of crude oil, which resulted in significant contamination to coastal states. These incidents clearly demonstrated that in some cases, the coastal states actually increased their risk to significant contamination by denying a vessel the opportunity to make repairs in relative safety, or by delaying a decision until no options remained. The port states' refusal to allow vessels in distress to find "safe refuge" ultimately became decisions that resulted in significant adverse environmental and economic consequences. The decision of whether to allow a distressed vessel into a place of refuge, including cases of force majeure[1], should be reached after consideration of the full range of potential impacts, rather than being based on a policy of wholesale denial of entry.

The purpose of these guidelines is to provide: (1) an incident-specific decision-making process to assist U.S. Coast Guard Captains of the Port (COTPs) in deciding whether a vessel needs to be moved to a place of refuge and, if so, which place of refuge to use; and (2) a framework for pre-incident identification of potential places of refuge for inclusion in appropriate Area Contingency Plans.

This document emphasizes the inclusion of USCG COTPs, Unified Commands, RRTs, Area Committees, natural resource trustees, and other stakeholders and technical experts in the identification of potential places of refuge during pre-incident planning. It also emphasizes consultation with appropriate stakeholders and other technical experts from multiple disciplines to assist the COTP in the decision-making process during an incident, including when an evaluation of potential places of refuge may be only one of several response activities taking place.

[1] Force majeure is defined as an overwhelming force or condition of such severity that it threatens the loss of the vessel, cargo, or crew unless immediate corrective action is taken.

[This Page Intentionally Left Blank]

Introduction

1. Purpose and Scope

The purpose of the *Guidelines for Places of Refuge Decision-Making (Guidelines[2])* is to provide:

(1) An incident-specific decision-making process (Appendix 1) to assist U.S. Coast Guard (USCG) Captains of the Port (COTPs) in deciding whether a vessel needs to be moved to a place of refuge and, if so, which place of refuge to use; and

(2) A framework for developing pre-incident identification of potential places of refuge for inclusion in appropriate Area Contingency Plans (ACPs)

These *Guidelines* address places of refuge decision-making in waters subject to U.S. jurisdiction. They are consistent with the December 2003 International Maritime Organization "Guidelines on Places of Refuge for Ships in Need of Assistance" and USCG Commandant Instruction 16451.9, "U.S. Coast Guard Places of Refuge Policy."
These *Guidelines* provide COTPs with a process that will help (1) expedite place of refuge decision-making, and (2) ensure stakeholders and other technical experts are consulted as appropriate. This in turn, helps ensure that COTPs have appropriate input, and the best available information, prior to making a place of refuge decision.

2. Overview

A "place of refuge" is defined as a location where a vessel needing assistance can be temporarily moved to, and where actions can then be taken to stabilize the vessel to: (1) protect human life, sensitive natural and cultural resources, historic properties, national defense, security, economic interests, and critical infrastructure; and (2) reduce or eliminate a hazard to navigation. A place of refuge may include constructed harbors, ports, natural embayments, or offshore waters with the necessary maritime support infrastructure.

Imperiled, structurally damaged, or leaking vessels (including vessels that have sunk and been refloated) may need to be brought into a harbor or anchored or moored in protected waters to make repairs to prevent or stop the loss of oil or other hazardous substances. Likewise, vessels that have lost power or steerage may need to be brought into a place of refuge for repairs to prevent a shipwreck that could result in the loss of fuel, hazardous substances, or other cargo. Taking these actions would
help prevent or minimize potential adverse effects to the public, the environment, resource users,

---

[2] "Guidelines" mean the decision-making guidelines and matters set forth in this document. Notwithstanding any such words as "may," "should," "will," or "would," these guidelines are intended solely as factors that may be considered with respect to the exercise of judgment in deciding whether, where, and when to direct or permit a vessel to seek a place of refuge, as well as considered during the execution and implementation of any such decisions.

and national defense, security, economic interests, and critical infrastructure. These incidents may (or may not) involve force majeure; i.e., an overwhelming force or condition of such severity that it threatens the loss of the vessel, cargo, or crew unless immediate corrective action is taken.

There are no places of refuge that are suitable for all vessels and all situations; therefore the National Response Team (NRT) does not support the pre-approval of places of refuge in waters subject to U.S. jurisdiction. Decisions relating to places of refuge need to be made on an incident-specific basis because they encompass a wide range of issues that vary according to each situation, such as:

- Each incident is unique (e.g., vessel size, fuel carried, and reason assistance is needed).
- Information relevant to a specific location may be incomplete or out-of-date.
- Weather and sea conditions are variable.
- Fish and wildlife resources are mobile and may or may not be in an area as anticipated.
- The locations of other activities (e.g., commercial fishing and recreational boating) vary over time.
- Resources (e.g., salvage vessels) available to respond to the incident vary over time.

The NRT does support pre-incident identification of potential places of refuge (PPORs) (see Appendix 3), which would then receive incident-specific evaluations if the location(s) is being considered as a PPOR for an actual incident. It is important to note that identifying PPORs during pre-incident planning does not require that those locations be used as a place of refuge. Likewise, it does not eliminate the need to review and refine (as appropriate) during the incident, information specific to the PPORs.

The best location for a place of refuge at any given point in time is dependent on incident-specific characteristics and real-time input by appropriate stakeholders (see Appendix 2) and other technical experts. When considering places of refuge decisions, COTPs typically need to consider multiple interests, which will include one or more of the following: (1) protecting human life, sensitive natural and cultural resources, historic properties, national defense, security, economic interests, and critical infrastructure; and (2) reducing or eliminating a hazard to navigation.

If time allows and if appropriate, the COTP will activate a Unified Command under the Incident Command System for the decision-making process. When an incident has the potential to involve more than one COTP zone, the cognizant USCG District Commander may assist in the decision-making process. The decisions to direct or permit a vessel to seek a place of refuge, as well as the decisions and actions implementing those decisions, will be based on best available information and sound professional judgment.

When a vessel is in need of assistance, each of the following vessel options should be considered, as appropriate:

- The vessel remaining in the same position.
- The vessel continuing on its voyage.

- The vessel moving farther from shore.
- The vessel being intentionally scuttled in deep water.
- The vessel being intentionally grounded.
- The vessel moving to a place of refuge.

The incident-specific place of refuge decision-making process, outlined in Appendix 1, recognizes that while the timeframe for COTPs to make decisions regarding places of refuge varies, it may be divided into the following three categories:

(1) The vessel's situation requires immediate action, leaving no time for "pre-decision" notification of, or consultation with, appropriate stakeholders and/or other technical experts.

(2) The vessel's situation requires rapid action, leaving time for notification of, and consultation with, some, but not all, appropriate stakeholders and/or other technical experts.

(3) The vessel's situation allows time for notification of, and consultation with, all appropriate stakeholders and/or other technical experts.

COTP response activities will occur within an Incident Command System. For incidents that include response activities (e.g., responding to an oil discharge from the vessel) in addition to places of refuge decision-making, the COTP should consider forming a "places of refuge" unit within the Planning Section, headed by the Deputy Planning Chief, to conduct the place of refuge evaluation. This unit would include appropriate stakeholders and other technical experts from the Operations and Planning Sections and the Command Staff. In addition, the unit would consult with other appropriate stakeholders and technical experts who are not represented in the Operations Section, Planning Section, and/or the Unified Command.

3. Selected Authorities and Responsibilities

The following is a description of selected authorities and responsibilities for Federal agencies, U.S. States, and U.S. possessions, territories, and commonwealths that may be involved in places of refuge decision-making as described in these *Guidelines*:

- The U. S. Coast Guard COTP (who is also the designated Federal On-Scene Coordinator) has authority to order vessels into and out of ports, harbors and embayments in order to protect the public, the environment, and maritime commerce.[3] While the COTP retains ultimate authority for places of refuge decision-making, the COTP is responsible, as outlined in the *Guidelines*, for consulting with appropriate natural resource trustees, Federally-recognized tribes, State On-Scene Coordinators, and other stakeholders and

[3] It should be noted that there may be some maritime homeland security situations where the COTP has Sensitive Security Information and/or classified information that may affect places of refuge decision-making. In those situations, the COTP will use appropriate protocols (e.g., the Maritime Operational Threat Response protocols) to relay information (as appropriate) to appropriate stakeholders and/or other technical experts .

technical experts, and activating (as appropriate) a Unified Command.

- The U.S. Department of the Interior, the U.S. Department of Commerce, and U.S. Department of Agriculture each have authority to represent and protect their respective interests for incidents that may threaten or affect lands (including submerged lands), shorelines, waters, or other resources within their respective jurisdiction; e.g., units of the national park system, national wildlife refuges, national forests, national marine sanctuaries, migratory birds, marine mammals, threatened and endangered species and their critical habitats, essential fish habitat, cultural resources, and historic properties. Representatives of these agencies are responsible, as outlined in the *Guidelines*, for providing timely input to the COTP/Unified Command on interests under their respective authorities and jurisdiction.

- U.S. States and U.S. possessions, territories, and commonwealths have authority to represent and protect their respective interests for incidents that may threaten or impact their respective land, waters, and other resources within their jurisdiction; e.g., State-owned submerged lands and State-owned shorelines. U.S. States and U.S. possessions, territories, and commonwealths each provide a designated State On-Scene Coordinator to represent their respective interests, who in turn, is responsible, as outlined in the *Guidelines*, for providing timely input to the COTP/Unified Command on interests under their respective authorities and jurisdiction.

It should be noted that there are other agencies (e.g., the U.S. Department of Homeland Security, U.S. Immigration and Customs Enforcement, and U.S Customs and Border Protection; U.S. Department of Health and Human Services, Centers for Disease Control and Protection; and U.S. Department of Justice, Federal Bureau of Investigation) that may also provide input to, or otherwise be involved in, places of refuge decision-making, based on their respective authorities and jurisdiction.

Appendix 1

Incident-Specific Places of Refuge Decision-Making Process

Step 1. Place of Refuge Requested.

The U.S. Coast Guard Captain of the Port (COTP)[4] receives a request from a vessel master or his/her representative[5] to move a vessel to a place of refuge. The COTP will request the following information from that individual:

- List of crew members, including:
  - names
  - date of birth
  - nationality
  - vessel particulars (e.g., length and gross tonnage)
- The location(s) of the place of refuge (if a specific location is requested).
- The reasons the vessel needs assistance and the specific assistance required.
- Alternatives (if any) in addition to moving the vessel to a place of refuge.
- A summary of medical and/or life safety issues associated with the incident, including the need to evacuate individuals from the vessel.
- Time when the problems began.
- Status of the vessel and its systems, including:
  - steering
  - propulsion
  - bilge pumps
  - lifesaving (e.g., lifeboats)
  - firefighting capability
  - service generator and emergency generator
  - watertight integrity
  - number of people onboard
- Status of the vessel's pumping system (if the vessel is flooding).
- Types, quantities, hazards, and condition of petroleum products, hazardous substances, and/or other cargo onboard (including animal, plant, or food cargo).
- Length of time the crew has been awake.
- Presence (or suspected presence) of rats or other invasive species and/or animal, plant, or human diseases onboard the vessel.
- On-scene weather and water conditions and marine forecast.

---

[4] When an incident has the potential to involve more than one COTP zone, the cognizant USCG District Commander may assist in the decision-making process.

[5] In the event there are no individuals on board the vessel authorized to make the request, or the vessel has been abandoned, the COTP will be responsible (to the extent possible) for obtaining appropriate information identified in Step 1.

- Status of notifications completed by master (e.g., owners, operators, agents, Qualified Individual, and class society).
- Measures already taken by the crew, including:
  - repairs
  - ballasting
  - cargo shifts
- Status of actions taken.
- Nation of Origin.
- Vessel's last port of call.
- Current position.
- Vessel owner's name, address, and contact information.
- Financial Responsibility Certificate.
- Oil Spill Response Organization (person in charge name and contact information).

Step 2. Immediate Action Required by COTP[6].

If the vessel's situation requires immediate action, leaving no time for consultation with appropriate stakeholders or other technical experts, the COTP will:

❒ Evaluate the options of the vessel remaining in the same position, continuing on its voyage, moving farther from shore, being intentionally scuttled in deep water, being intentionally grounded, or moving to a place of refuge.

❒ Determine, if moving to a place of refuge is an option, whether potential places of refuge have been identified in the area where the vessel may be moved to, and if so, whether any potential places of refuge locations are appropriate for this incident.

❒ Permit or direct the vessel to stay in place, continue on its voyage, move farther from shore, intentionally ground, move to a place of refuge, or prepare for scuttling in deep water.

❒ Inform appropriate stakeholders and other technical experts (see Appendix 2) of the decision.

❒ Activate, if necessary, a Unified Command to address any remaining issues.

[6] It is important to note that Step 2 should only be used when an incident truly requires immediate action, since selection of a place of refuge without incident-specific consultation with appropriate natural resource trustees, Federally-recognized tribes, State On-Scene Coordinators, and other stakeholders and technical experts may result in a decision based on incorrect and/or incomplete information.

Step 3. COTP/Unified Command[7] requests input from stakeholders and other technical experts on vessel options.

If the vessel's situation does not require immediate action, the COTP will:

- ❒ Activate a Unified Command, if appropriate.
- ❒ Require, if appropriate, the vessel master or owner/operator to contract with a salvor and/or pollution response contractor.
- ❒ Consider dispatching, if safety considerations and time allow, an appropriate inspection team to board the vessel to evaluate the vessel's condition.
- ❒ Determine whether potential places of refuge have been identified in the area where the vessel may be taken, and if so, whether any are appropriate to consider for this incident.
- ❒ Contact the National Oceanic and Atmospheric Administration (NOAA) Scientific Support Coordinator (SSC) to request that the NOAA SSC identify the following information, as appropriate, for the options of the vessel remaining in the same position, continuing on its voyage, moving farther from shore, being intentionally scuttled in deep water, being intentionally grounded, or moving to a place of refuge:
  - Weather and sea states, including prevailing winds.
  - Tides and currents.
  - Largest scale navigational charts of the area.
  - Seasonal considerations, such as ice.
  - Potential temporary grounding locations (if intentional temporary grounding is an option).
  - Trajectories for products already released or potentially discharged from the vessel.
  - Oil or chemical fate analysis.
- ❒ Contact (depending on the incident) appropriate Federal, State, and/or local safety and public health entity representatives to request that they:
  - Identify any public health and/or safety issues, or potential issues, related to individuals still onboard, individuals responding to the incident, and to the general public for the options of the vessel remaining in the same position, continuing on its voyage, moving farther from shore, being intentionally scuttled in deep water, being intentionally grounded, or moving to a place of refuge.

[7] While information in Steps 3 through Step 10 refers to the COTP/Unified Command, if the COTP determines that activation of a Unified Command is not appropriate or necessary, the reference to "Unified Command" in Step 3 through Step 10 will not be applicable.

- ❒ Contact natural resource trustee representatives to request that they:
  - ➢ Identify any impacts, or potential impacts, to natural and cultural resources and historic properties at risk for the options of the vessel remaining in the same position, continuing on its voyage, moving farther from shore, being intentionally scuttled in deep water, being intentionally grounded, or moving to a place of refuge.
- ❒ Contact (depending on the incident) representatives of Federally-recognized tribes to request that they:
  - ➢ Identify any impacts, or potential impacts, to interests of Federally-recognized tribes related to the vessel remaining in the same position, continuing on its voyage, moving farther from shore, being intentionally scuttled in deep water, being intentionally grounded, or moving to a place of refuge.
- ❒ Contact (depending on the incident) Federal, State, and/or local critical infrastructure and/or security entities to request that they :
  - ➢ Identify any security issues, or potential issues, related to individuals still onboard, individuals responding to the incident, and to the general public, and/or any critical infrastructure considerations for the options of the vessel remaining in the same position, continuing on its voyage, moving farther from shore, being intentionally scuttled in deep water, being intentionally grounded, or moving to a place of refuge.
- ❒ Contact (depending on the incident) Federal, State, and/or local agricultural and animal entity representatives to request that they:
  - ➢ Identify any issues, or potential issues, related to animal or plant disease and/or invasive species and disposal or salvage of animal, plant, and/or food cargo for the options of the vessel remaining in the same position, continuing on its voyage, moving farther from shore, being intentionally scuttled in deep water, being intentionally grounded, or moving to a place of refuge.
- ❒ Contact (depending on the incident) Federal, State, and/or local economic entity representatives to request that they:
  - ➢ Identify any Federal, State, and/or local economic impacts, or potential impacts, for the options of the vessel remaining in the same position, continuing on its voyage, moving farther from shore, being intentionally scuttled in deep water, being intentionally grounded, or moving to a place of refuge.
- ❒ Contact other appropriate stakeholders (see Appendix 2), as time allows, to request that they:
  - ➢ Identify other stakeholder impacts/concerns, or potential impacts/concerns, for the options of the vessel remaining in the same position, continuing on its voyage, moving farther from shore, being intentionally scuttled in deep water, being intentionally grounded, or moving to a place of refuge.

- ❒ Contact the vessel master, vessel owner, and salvage experts to request that they provide, as appropriate, information on:
  - Vessel status/seaworthiness, in particular buoyancy, stability, availability of propulsion and power generation, docking ability, and any progressive deterioration.
  - Any impending threat to the vessel or its product.
  - Availability of rescue tugs/tow vessels of sufficient size and power to aid the vessel in distress.
- ❒ Contact appropriate oil spill response organizations to request that they provide information on:
  - Ability and/or feasibility to respond to discharges/releases from the vessel.

Step 4. COTP/Unified Command selects vessel option based on input from stakeholders and other technical experts.

Based on the input received in Step 3, the COTP/Unified Command will evaluate the considerations listed below and will then determine whether the vessel should remain in the same position, continue on its voyage, move farther from shore, be intentionally scuttled in deep water, be intentionally grounded, or move (or be taken to) a place of refuge:

Vessel Status and Risk Considerations

- The kind and size of the vessel.
- The status/seaworthiness of the vessel, in particular buoyancy, stability, watertight integrity, availability of propulsion and power generation, docking ability, and any progressive deterioration.
- Types, quantities, hazards, and condition of petroleum products, hazardous substances, and/or other cargo onboard.
- The presence (or suspected presence) of rats or other invasive species onboard the vessel.
- Any impending threat to the vessel or its product.
- Weather conditions and forecasts.
- Master's ability to navigate the vessel or need for a pilot.
- Vessel traffic in the area.
- Ability of vessel to move from its current location, and estimated distance it could transit without further incident.
- Other vessel status or risk considerations, if any.

Response and Salvage Resources Considerations

- Availability of rescue tugs/tow vessels of sufficient size and power to aid the vessel in distress, including towing.
- Salvage and spill response resources on-scene with the vessel and available during transit.
- Vessel traffic in the area.
- Access to pier or dock with repair and/or cargo handling facilities.

- Access to vessel by emergency service equipment (e.g., ambulances, fire fighting equipment, and radiological gear).
- Other response or salvage resources considerations, if any.

Public Health and Safety Considerations

- Safety, or potential safety issues for individuals (if any) still onboard.
- Safety, or potential safety issues for individuals performing salvage/response activities.
- Impacts, or potential impacts, on public health and safety (e.g., from human diseases and/or cargo onboard).
- Closure, or potential closure, of water intakes (e.g., for drinking water supplies and/or power plants).
- Other considerations, if any, identified by Federal, State, and/or local safety and public health entity representatives.

Natural and Cultural Resources and Historic Properties Considerations

- Impacts, or potential impacts, on sensitive resources (e.g., migratory birds, marine mammals, fish, shellfish, threatened or endangered species, cultural resources, and/or historic properties).
- Impacts, or potential impacts, on sensitive areas (e.g., designated essential or critical habitats, sea grass beds, mangrove swamps, marshes, marine sanctuaries, parks, refuges, and/or forests).
- Other considerations, if any, identified by natural resource trustee representatives.

National Defense, Security, and Economic and Critical Infrastructure Considerations

- Impacts, or potential impacts, to national security interests and defense readiness.
- Economic, or potential economic, impacts resulting from:
  - Port closures (e.g., loss of perishable goods and/or delays in transportation of goods and people)
  - Disruption of recreational activities (e.g., beach closures), commercial fisheries, mariculture, and other activities
  - Other considerations, if any, identified by Federal, State, and/or local economic entity representatives

Other Considerations

- Liability, insurance, and compensation issues and limits.
- Requirements of port or harbor authorities for financial responsibility and bonding.
- Media and public interest.
- Contamination of private property.
- Other considerations (not already identified).

If the COTP/Unified Command selects the option of moving the vessel to a place of refuge, the remaining steps in this appendix should be completed. If the COTP/Unified Command selects another vessel option (i.e., remaining in the same position, continuing on its voyage, moving farther from shore, being intentionally scuttled in deep water, or being intentionally grounded), no additional steps in this appendix need to be taken.

Step 5. COTP/Unified Command requests input from technical experts on operational considerations for potential places of refuge locations.

To help identify one or more potential places of refuge locations based on operational considerations, the COTP/Unified Command will:

- ❒ Request from the NOAA SSC, the following information, as appropriate for all potential places of refuge locations being considered:
  - Weather and sea state including prevailing winds.
  - Tides and currents.
  - Seasonal considerations, such as ice.
  - Trajectories for products already released and/or potentially discharged from the vessel.
  - Oil or chemical fate analysis.

- ❒ Request from appropriate Pilots Association or other mariners, the following applicable port or anchorage criteria:
  - The type and size of the vessel and required "swing room" relative to the size of the place of refuge site.
  - Adequate water depth at mean lower low water (MLLW) to accommodate the vessel.
  - Navigational approach, including vessel traffic and associated risks.
  - Pilotage requirements.
  - Anchoring depth and ground, or suitable docking facilities.
  - Availability of repair facilities.
  - Availability of cargo reception and storage facilities.
  - Land and/or air access.
  - Availability of required emergency response capabilities (e.g., firefighting, pollution. prevention, law enforcement, and/or State or Federal food inspectors).
  - Other pertinent port or anchorage information, if any.

- ❒ Request from appropriate salvage experts (e.g., USCG and vessel salvage representatives), the following information, as appropriate, for all potential places of refuge locations being considered:
  - Any new information on the status/seaworthiness of the vessel, in particular buoyancy, stability, watertight integrity, availability of propulsion and power generation, docking ability, and progressive deterioration.
  - Any new information on the impending threat to the vessel or its product.
  - Availability of rescue tugs/tow vessels of sufficient size and power to aid the vessel in distress, including towing.

- Available salvage and spill response resources.
- Availability of appropriate and compatible lightering equipment and receiving vessels.
- Availability of product storage (e.g., tanker barge, other vessels).
- Availability of skilled labor and trained personnel.
- Access to repair equipment and facilities.
- Availability of cargo reception and storage facilities.
- Salvage and response vessel access.
- Other pertinent salvage-related information, if any.

❒ Request (if applicable) from appropriate oil spill response organizations, the following information for all potential places of refuge locations being considered:

- Ability and/or feasibility to respond to discharges/releases from the vessel.
- Other pertinent oil spill response information, if any.

❒ Request (if applicable) from appropriate port or harbor authorities and/or land owners and land managers, the following information for all potential places of refuge locations being considered:

- Permits or other requirements, or other pertinent information, if any.

Step 6. COTP/Unified Command selects potential place(s) of refuge location(s) based on operational considerations.

Based on input received from technical experts in Step 5, the COTP/Unified Command will select one or more potential places of refuge locations based on the following operational considerations:

Port or Anchorage Area Criteria

- The type and size of the vessel compared to the size of the place of refuge site.
- Adequate water depth at MLLW to accommodate the vessel.
- Navigational approach, including vessel traffic and associated risks.
- Pilotage requirements.
- Tides and currents.
- Seasonal conditions, such as ice.
- Anchoring depth and bottom characteristics, or suitable docking facilities.
- Availability of repair facilities.
- Availability of cargo reception and storage facilities.
- Land and/or air access.
- Weather and sea state including prevailing winds.
- Requirements from port authorities and/or area landowners/managers.
- Ability to adequately secure the area from subsequent threats and/or contain shipboard threats.
- Availability of necessary emergency response capabilities (e.g., fire fighting, pollution response, law enforcement, rat prevention, and/or State or Federal food inspections).

- Other pertinent port or anchorage information, if any.

Response, Salvage, and Repair Resources

- Available salvage and spill response resources.
- Salvage and response vessel access.
- Availability of appropriate and compatible lightering equipment and receiving vessels.
- Availability of product storage (e.g., tanker barge or other vessels).
- Availability of skilled labor and trained personnel.
- Access to repair equipment and facilities.
- Availability of cargo reception and storage facilities.
- Other pertinent response, salvage, or repair resource information, if any.

Other Command Management Factors

- Liability, insurance, and compensation issues and limits.
- Requirements of port or harbor authorities for financial responsibility and bonding.
- Required notifications such as marine pilots, if applicable.
- Public expectations and media outreach.
- Other pertinent command management factors, if any.

Step 7. COTP/Unified Command provides stakeholders with potential place(s) of refuge location(s) based on operational considerations.

The COTP/Unified Command will provide the following information to natural resource trustee and other appropriate stakeholder representatives:

- The list of potential place(s) of refuge.
- Principal reasons for selecting each location (e.g., the vessel cannot travel far without sinking; or location of repair facilities).
- How the vessel will transit to the area (e.g., on its own power or assisted by a tug) and transit route.
- Amount, location, and type of petroleum products and/or other hazardous substances remaining on the vessel; the likelihood of discharge/release; and the anticipated trajectory for any products released at any point along the vessel's intended transit route.
- The presence (or suspected presence) of animals, plants, food products, invasive species, and/or animal or plant diseases onboard.
- What incident-related activities will occur in the place of refuge (e.g., lightering and underwater welding).
- What support vessels/aircraft will be required (e.g., salvage vessel).
- The estimated duration the vessel will be in that location.
- Transit route of the vessel upon leaving the location.
- Anticipated weather and sea states (including prevailing winds), tides and currents, and seasonal considerations relevant to places of refuge locations.
- Other pertinent information, if any.

Step 8. Stakeholders provide ranking of potential place(s) of refuge location(s) to COTP/Unified Command.

Based on information provided to them in Step 7, natural resource trustees and other appropriate stakeholder representatives will:

- Review the information provided to them in Step 7.
- Rank the potential places of refuge locations, providing a consensus ranking where possible.
- Identify any special considerations or constraints and/or any permits or other authorizations required for any potential places of refuge locations.
- Provide the COTP/Unified Command with the ranking of potential places of refuge locations and any identified special considerations or constraints and/or any permits or other authorizations required.
- Provide, as appropriate, the COTP/Unified Command with documentation of considerations taken into account when arriving at a consensus position.

Note: In the event the COTP/Unified Command provides stakeholders in Step 7 with only one potential place of refuge location based on operational considerations, stakeholders will provide consensus input to the COTP/Unified Command regarding the location; any identified special considerations or constraints and/or any permits or other authorizations required; and documentation of considerations taken into account when arriving at the consensus position.

Step 9. COTP/Unified Command selects place of refuge based on input from stakeholders and other technical experts.

Based on input received from stakeholders and other technical experts, the COTP/Unified Command will:

- ❒ Direct or allow the vessel to move to a place of refuge, in accordance with any identified special considerations or constraints and any permits or other authorizations.
- ❒ Inform stakeholders and other technical experts of the decision and of any additional response-related assistance required.
- ❒ Continue overseeing or directing, as appropriate, response activities until the case is closed.

Note: In the event that potential place(s) of refuge location(s) identified in Step 7 and evaluated by stakeholders in Step 8 are not workable and/or circumstances have changed and moving the vessel to a particular place of refuge location is no longer an option, the COTP/Unified

Command will re-analyze vessel options using the appropriate steps in these guidelines.

Step 10. The COTP/Unified Command prepares documentation of the places of refuge decision-making process.

Appendix 2

Potential Stakeholders

- Federal and State natural resource trustees, when the vessel is within, or may enter, U.S. waters.
- Federally-recognized tribes, if the interests of Federally-recognized tribes have been, or may be affected.
- U.S. possessions, territories, and commonwealths, if the vessel will, or could be, directed to waters of a U.S. possession, territory, and commonwealth.
- Foreign governments (e.g., Canadian Federal and Provincial, Mexican Federal and State, and Russian Federal), if the vessel is, or could be, in a trans-boundary area.
- State On-Scene Coordinators, when the vessel is within, or may enter, State waters.
- Federal, State, and local safety and public health entities, if there is, or may be, a risk to public safety and/or health.
- Federal, State, and local critical infrastructure entities, if there is, or may be, a risk to critical infrastructure.
- Federal, State, and local security entities, if there is, or may be, a security risk.
- Federal, State, and/or local economic entities, if there are, or may be, economic impacts.
- Federal, State, and local agricultural entities, if there are, or may be, invasive species, animal or plant disease onboard and/or if there is animal, plant, or food cargo onboard.
- Local governments, if there is, or may be, a risk to their jurisdiction.
- Port authorities, if the vessel will, or may be, taken to their port.
- Private landowners and business owners, if their property will, or may be, affected.

[This Page Intentionally Left Blank]

Appendix 3

Process for Pre-Incident Identification of Potential Places of Refuge

Purpose

At stated above in Section 2, there are no places of refuges that are suitable for all vessels and all situations; therefore the National Response Team (NRT) does not support the pre-approval of places of refuge in waters subject to U.S. jurisdiction. At the same time, the NRT supports the identification of potential places of refuge (PPOR), which would receive incident-specific evaluations if the location(s) is being considered as a PPOR for an actual incident. It is important to note that identifying PPORs during pre-incident planning does not require that those locations be used as a place of refuge. Likewise, it does not eliminate the need to review and refine (as appropriate) during the incident, information specific to the PPORs.

This appendix provides the framework for identifying PPORs, which would then be included in the appropriate Area Contingency Plan. Following this framework will ensure that both the process for identifying PPORs and the resulting PPOR documents are consistent with the NRT *Guidelines for Places of Refuge Decision-Making (Guidelines).*

PPOR Document Development

Steps recommended for identifying PPORs include the following:

- Establish an Area/Sub-area Contingency Plan PPOR Work Group of interested and knowledgeable stakeholders and other technical experts for the geographic area to be addressed.

- Identify the casualty risks, including the types of vessel (e.g., oil tankers, LNG tankers, tank barges, and/or cruise ships) and the anticipated transit routes of those vessels.

- Identify physical and operational characteristics of the vessels and PPOR locations to be included.

- Identify candidate PPOR locations.

- Identify, for PPOR locations, public health and safety, natural and cultural resources and historic properties, response and salvage resources, and other stakeholder considerations.

- Identify land owners and land managers for PPOR locations.

- Prepare PPOR chart/table sheets for each PPOR location (see next section below).

- Include the resulting documents in the Area/Sub-Area Contingency Plan following public review and any revisions based on that review.

PPOR Document Contents:

Recommended contents of PPOR documents include:

- Purpose and Scope – A narrative introducing PPORs and describing how the regional PPOR document is used in conjunction with, and tiers off, the NRT Guidelines.

- How Document Was Developed – A narrative outlining the process used to identify PPOR locations and who participated in the process.

- How to Use the PPOR – A narrative briefly describing how regional PPOR information is used in conjunction with, and tiers off, the NRT Guidelines.

- Site Assessment Matrix – A summary of PPOR locations in one matrix, which includes information such as: location name, type of berthing, latitude/longitude, available swing room, dock face, water depth, bottom type, wind exposure, conflicting uses, ability to boom, geographic response strategies/plans, sensitive resources, distance to population centers, and distance to alternative PPORs.

- Index of PPOR Map – A map showing all PPOR locations.

- PPOR Chart/Table Sheets – One-page (two-sided) sheeting containing, for each PPOR location:

    - Side one: One or more color navigation charts of the PPOR location showing information, such as: approaches, anchorages, moorings, docks/piers, existing geographic response strategies/plans, and other relevant infrastructure; a color aerial photograph of the location; and a chart legend.

    - Side two: Tables containing information for each PPOR location describing physical and operational characteristics (e.g., maximum vessel size, navigational approach, minimum and maximum water depths, maximum vessel draft, types of berthing, swing room/dock face, bottom type, moorings, anchorages [including those for firefighting], docks, piers, prevailing winds, currents, tides, sea conditions, shelter from severe storms, fog, and ice); and other locational considerations (e.g., public health and safety [such as distances to communities], natural and cultural resources and historic properties considerations [such as threatened or endangered species and sensitive habitat areas and whether (or not) rats or other invasive species are present at the port], response and salvage considerations [such as ability to boom vessel and closest alternative PPOR]); other stakeholder considerations (such as fisheries, tourism/recreation, and waterfront public facilities); and land owners/land managers for the location.

Executive Summary

This National Response Team (NRT) document provides guidance for federal On-Scene Coordinators (OSCs) and Area Committees developing solutions for the abatement of pollution from abandoned vessels. This document also examines options applicable to the removal and disposition of abandoned vessels, including existing state programs. Developed in response to growing concerns over abandoned vessels throughout United States (U.S.) waterways, the *Abandoned Vessel Authorities and Best Practices Guidance* is designed to provide OSCs with information about the regulatory and policy authority of each agency having a major nexus to abandoned vessels; roles and responsibilities of each agency pursuant to those authorities; best practices used for responding to abandoned vessels; and options for removal and ultimate disposition of abandoned vessels.

This document offers a wide array of solutions to abandoned vessels including abatement of pollution, removal of the abandoned vessels through a variety of alternative programs, or application of navigable waterway solutions (e.g., Notice to Mariners or Markings). Based on previous case studies, it has been observed that a combination of both federal and state authorities and programs may provide the most effective and comprehensive approach for addressing abandoned vessels. This document is designed to be a living document and is intended to provide OSCs with the most current technological and programmatic developments and information regarding abandoned vessel abatement and disposition. This document will be periodically reviewed and updated by the NRT as appropriate.

Acknowledgements

The NRT acknowledges the NRT member agencies and state and federal agencies participating on the Regional Response Teams (RRTs) for their contributions in preparing this document. How to Use This Guidance

This document is designed for the federal OSC and USCG Captain of the Port (COTP) to use as a desk reference tool for abandoned vessel response.[1] Developed jointly by the NRT's 15 member agencies, this document includes key information pertinent to addressing legal authorities to act, as well as best practices and lessons learned from previous responses. Case studies from a variety of responses have been included, such as small marina vessels, larger abandoned commercial vessels, and post-Stafford Act disaster responses, such as post-hurricane debris and vessel removal operations.

The *Abandoned Vessel Authorities and Best Practices Guidance* is divided into six key sections, and is formatted to follow the same general phases of response employed during pollution abatement and removal operations.

- ***Section 1.0 – Definition of Terms*** provides information on the terms associated with abandoned vessels.
- ***Section 2.0 – Background and Overview*** includes information on the purpose and background of this Guidance, assumptions, and the overarching pattern of response for abandoned vessels.
- ***Section 3.0 – Initial Assessment*** describes the steps involved in abandoned vessel assessment, including documentation and safety considerations.
- ***Section 4.0 – Response Authorities*** provides an overview of the applicable laws and regulations relating to abandoned vessels, wrecks, and hazards to navigation.
- ***Section 5.0 – Funding Authorities*** provides information on the use of federal funds for the removal of abandoned vessels, when funds can be used, when they cannot, and under what authorities.
- ***Section 6.0 – Vessel Removal and Options for Ultimate Disposition*** describes response options based on federal authorities and funding established in previous sections. This section discusses various removal methods, constraints, and documentation procedures for response activities.

Best practices are incorporated, as appropriate, into these sections and into the Case Studies in Appendix A, which consider both smaller abandoned vessels as well as larger submerged legacy wrecks.

This document also includes a series of appendices designed to provide additional reference materials and tools. These include:

- ***Appendix A: Abandoned Vessel Response Case Studies*** provides a synopsis of a variety of vessel removal cases, including state removal, removal after a natural disaster, dismantling for recycling, scrapping, and/or disposal on land, and removal by other federal agencies.
- ***Appendix B: Technical Specialist and Special Teams*** includes additional information on special teams available to the OSC/COTP for assistance with abandoned vessel operations.
- ***Appendix C: State Abandoned Vessel Programs*** provides a summary of state abandoned vessel programs (if applicable), including whether they are funded and any applicable

[1] Under 40 C.F.R. §300.120(b), USCG COTPs serve as the designated OSCs for areas in the coastal zone for which an Area Contingency Plan (ACP) is required.

statutes. This section is developed to assist OSCs in capitalizing on existing programs in addition to federal resources.

- ***Appendix D: Pollution Mitigation of Legacy Wrecks*** provides a primer on submerged legacy wreck abatement. This section focuses primarily on pollution abatement, rather than removal of submerged wrecks.
- ***Appendix E: Abandoned Vessel Program Development*** offers examples of programs that have been successful in abandoned vessel removal and makes recommendations for local and regional abandoned vessel program development.
- ***Appendix F: EPA Ocean Disposal Permitting Program*** provides regulations applicable to EPA's ocean disposal general permit process.
- ***Appendix G: References and Additional Reading Materials*** provides references, worksheets, and samples of products and other materials to assist OSCs in performing their responsibilities.
- ***Appendix H: Acronyms*** identifies acronyms and abbreviations.

Section 1.0 Definition of Terms

The following terms are those most commonly associated with abandoned vessel removal and pollution abatement activities by OSCs, RRTs, state officials, first responders, and other stakeholders. These terms and definitions may vary among different federal and state laws, regulations, and guidance. **The use of these terms in this Guidance is not intended to, nor does it supersede any legal determinations under federal or state law.**

Abandoned Vessel

The Rivers and Harbors Appropriation Act of 1899 (RHA) contains several sections known as the Wreck Act that addresses sunken vessels.[2] There is a statutory presumption under the Wreck Act that sunken vessels that are not removed within 30 days are abandoned. [3] Under the implementing regulations of the Wreck Act, "'Abandonment' means the surrendering of all rights to a vessel (or other obstruction) and its cargo by the owner, or owners if vessel and cargo are separately owned."[4] These implementing regulations specifically note that they are applicable to the removal of wrecks or other obstructions within the navigable waters of the U.S., but they do "not apply to the summary removal or destruction of a vessel by the USCG under authority of the Clean Water Act (CWA)."[5] Accordingly, the requirements below for establishing "abandonment" are generally applicable to the U.S. Army Corps of Engineers' (USACE) application under the RHA.

> "In all cases other than emergency, abandonment will be established as a precondition to Corps removal, to avoid a "taking" of private property for public purposes. Abandonment is established by either:
>
> (1) Affirmative action on the part of the owner declaring intention to abandon, or
>
> (2) Failure to commence immediate removal of the obstruction and prosecute such removal diligently."[6]

In its policy statement on "Removal of Wrecks and Other Obstructions," USACE defines "abandonment" as follows: "Abandonment is an owner's giving up the exclusive right to salvage and an indication of no intent to claim the vessel. Abandonment DOES NOT relieve the owner of his/her legal obligation to remove the wreck or of liability for damages caused by the wreck (unless he or she is a non-negligent owner of a wreck which sank before enactment of PL 99-662, 17 November 1996).[7] "Abandon," as defined by the Abandoned Barge Act of 1992, means "to moor, strand, wreck, sink, or leave a barge of more than 100 gross tons…unattended for longer than forty-five days."[8]

"Abandoned vessels" has also been defined by the USCG in its October 2011 Commandant Instruction 16465.5 addressing "Vessel Removal/Destruction under the Federal Water Pollution Control Act [FWPCA] or Comprehensive Environmental Response, Compensation, and Liability Act [CERCLA]" to mean "any craft designed for navigation that has been moored, stranded, wrecked, sunk, or left unattended for longer than 45 days. A vessel is not abandoned if it is on private property with the

[2] 33 U.S.C. §§ 409, 411, 412, 414 & 415.
[3] 33 U.S.C. § 414(a).
[4] 33 Code of Federal Regulations (C.F.R.) § 245.5
[5] 33 U.S.C. § 1321
[6] 33 C.F.R. § 245.45
[7] Department of the Army, Regulation No. 1130-2-250, Chapter 4, 26 November 1996
[8] 46 U.S.C. § 4701(1)

permission of the owner." See also Commandant Instruction M16465.43, 5 April 1996, which includes the same definition of "abandoned vessel."[9]

Coastal Waters

"Coastal waters" means "…the waters of the coastal zone except for the Great Lakes and specified ports and harbors on inland rivers."[10]

Coastal Zone

"Coastal zone" means "all [U.S.] waters subject to the tide, [U.S.] waters of the Great Lakes, specified ports and harbors on inland rivers, waters of the contiguous zone, other waters of the high seas subject to the NCP [National Oil and Hazardous Substances Pollution Contingency Plan], and the land surface or land substrata, ground waters, and ambient air proximal to those waters. The term coastal zone delineates an area of federal responsibility for response action. Precise boundaries are determined by EPA/USCG agreements and identified in federal regional [and area] contingency plans."[11]

Inland Waters

"Inland waters" means "the waters of the inland zone, waters of the Great Lakes, and specified ports and harbors on inland rivers."[12]

Legacy Wreck

"Legacy Wreck" is a term of art used in this document to generally describe sizeable and long-submerged shipwrecks. The term "Historic Wreck," where used in this document, applies to those wrecks applicable under the National Historic Preservation Act (NHPA), Abandoned Shipwreck Act (ASA), and Sunken Military Craft Act.[13]

Navigable Waters

The CWA at 33 U.S.C. § 1362(7) defines "navigable waters" as "the waters of the United States, including the territorial seas." The NCP in 40 C.F.R. Part 300.5 and the implementing regulations for the CWA interpret the term to include:

(1) All waters that are currently used, were used in the past, or may be susceptible to use in interstate or foreign commerce, including all waters that are subject to the ebb and flow of the tide;
(2) Interstate waters, including interstate wetlands;
(3) All other waters such as intrastate lakes, rivers, streams (including intermittent streams), mudflats, sandflats, and wetlands, the use, degradation, or destruction of which would affect or could affect interstate or foreign commerce including any such waters:
    (i) That are or could be used by interstate or foreign travelers for recreational or other purposes;
    (ii) From which fish or shellfish are or could be taken and sold in interstate or foreign commerce;
    (iii) That are used or could be used for industrial purposes by industries in interstate commerce;
(4) All impoundments of waters otherwise defined as navigable waters under this section;
(5) Tributaries of waters identified in paragraphs (a) through (d) of this definition, including adjacent wetlands; and
(6) Wetlands adjacent to waters identified in paragraphs (a) through (e) of this definition: Provided, that waste treatment systems (other than cooling ponds meeting the criteria of this paragraph) are not waters of the [U.S.]

[9] The USCG's guidance definition of abandoned vessel does not apply to EPA's implementation of its authority under the CWA or CERCLA.
[10] 40 C.F.R. § 300.5
[11] *Ibid*
[12] *Ibid*
[13] http://www.history.navy.mil/branches/org12-12a.htm

(7) Waters do not include prior converted cropland. Notwithstanding the determination of an area's status as prior converted cropland by any other federal agency, for the purposes of the [CWA], the final authority regarding [CWA] jurisdiction remains with EPA."[14]

Navigable Waters of the U.S., Navigable Waters, and Territorial Waters [15]

Under Title 33 C.F.R. § 2.36, these terms are defined as follows: "(a) Except as provided in paragraph (b) of this section, *navigable waters of the [U.S.], navigable waters, and territorial waters* mean, except where Congress has designated them not to be navigable waters of the [U.S.]:

> (1) Territorial seas of the [U.S.];
> (2) Internal waters of the [U.S.] that are subject to tidal influence; and
> (3) Internal waters of the [U.S.] not subject to tidal influence that:
>
> > (i) Are or have been used, or are or have been susceptible for use, by themselves or in connection with other waters, as highways for substantial interstate or foreign commerce, notwithstanding natural or man-made obstructions that require portage, or
> >
> > (ii) A governmental or non-governmental body, having expertise in waterway improvement, determines to be capable of improvement at a reasonable cost (a favorable balance between cost and need) to provide, by themselves or in connection with other waters, as highways for substantial interstate or foreign commerce.

(b) *Navigable waters of the [U.S.] and navigable waters*, as used in sections 311 and 312 of the [FWPCA], as amended, 33 U.S.C. § 1321 and 1322, mean:

> (1) Navigable waters of the [U.S.] as defined in paragraph (a) of this section and all waters within the [U.S.] tributary thereto; and
>
> (2) Other waters over which the Federal Government may exercise Constitutional authority."

Further, under Title 33 C.F.R. § 329.4: "A determination of navigability, once made, applies laterally over the entire surface of the waterbody, and is not extinguished by later actions or events which impede or destroy navigable capacity." This definition is used by USACE for the RHA, including the Wreck Act.

Marine Debris

"(a) Marine debris. For the purposes of the Marine Debris Act of 2012 (33 U.S.C. § 1951–1958) only, marine debris is defined as any persistent solid material that is manufactured or processed and directly or indirectly, intentionally or unintentionally, disposed of or abandoned into the marine environment or the Great Lakes.

(b) NOAA [National Oceanic and Atmospheric Administration] and USCG have jointly promulgated the definition of marine debris in this part. NOAA's regulation may be found in 15 C.F.R. Part 909." [16]

When the final rule was published, in response to comments about the definition of "marine debris," USCG and NOAA explained that "an item or piece of an item originally placed or permitted in the marine

[15] 33 C.F.R. § 2.36
[16] 33 C.F.R. § 151.3000

environment, but that subsequently breaks apart, becomes lost, or is no longer actively monitored, could be considered disposed of or abandoned and would meet the definition of marine debris.[17]

Ship

"Ship" means a seagoing vessel of any type whatsoever, and *any floating* craft, except an installation or device engaged in the exploration and exploitation of the resources of the seabed and the ocean floor and the subsoil thereof.[18]

Vessel

Generally, under CERCLA, CWA and NCP, the term "vessel" means every description of watercraft or artificial conveyance used, or capable of being used, as a means of transportation on water. Specifically, the NCP explains that "'vessel' as defined by section 101(28) of CERCLA, means every description of watercraft or other artificial contrivance used, or capable of being used, as a means of transportation on water; and, as defined by section 311(a)(3) of the CWA, means every description of watercraft or other artificial contrivance used, or capable of being used, as a means of transportation on water other than a public vessel."[19]

Section 2.0 Background and Overview

2.1 PURPOSE

At the 2011 NRT-RRT Co-Chairs conference, a session on abandoned vessels was held where representatives from NOAA and USCG gave presentations. Based on issues presented and discussed during the session, the NRT Executive Secretariat agreed on the need for the NRT to identify interagency best practices when responding to abandoned vessels.

The *Abandoned Vessel Authorities and Best Practices Guidance* is designed to provide OSCs with:

- Information about the regulatory and policy authority of each agency having a major nexus to abandoned vessels;
- Roles and responsibilities of each agency pursuant to those authorities;
- Best practices used for responding to abandoned vessels; and
- Options for removal and ultimate disposition of abandoned vessels.

The workgroup was convened under the NRT Preparedness Committee and co-chaired by USCG and NOAA.

The NRT urges OSCs to actively engage with members of federal, state, local, tribal, and industry groups to assess this Guidance and identify areas for improvement. This Guidance is a living document, and changing technologies, accumulated experience, and operational improvements are expected to bring about revisions to the document. Please provide recommendations for improvements and updates to this Guidance to your RRT co-chairs. RRT co-chairs may forward recommendations to the chair of the NRT Preparedness Committee.

2.2 BACKGROUND

The NRT developed this document to establish a compendium of key laws and authorities relating to abandoned vessel mitigation, as well as special teams and best practices available to the OSC/COTP to mitigate these cases. Currently, a variety of federal, and in some cases state, statutes address different aspects of the abandoned vessel problem. Yet in no case is there comprehensive policy to address the growing issue. Although there is funding available to remove pollutants and vessels posing a hazard to navigation, these characteristics are not inclusive of all abandoned vessels. Throughout the U.S. and its territories, thousands of vessels remain abandoned, either left to deteriorate by the owner or operator or as the product of a catastrophic event resulting in the loss of the vessel. Generally unsightly, some abandoned vessels pose a significant threat to the environment, human health, and navigational safety as an obstruction to navigation, either through vessel deterioration, physical damage to the surrounding ecosystems, through the proliferation of marine debris, or the threat of discharge of oil and/or hazardous substances into the marine environment, including materials left on the vessel when abandoned and the potential use of the vessel as an illegal dumping site for oil and other hazardous substances.[20]

The foremost challenges in addressing abandoned vessels will be identifying vessels throughout various regions of the U.S., prioritizing the threat posed to public health and the environment, determining

[20] The M/V Kimton in Puerto Rico demonstrated that simply removing oil from a grounded vessel in not necessarily the best alternative and may unintentionally enable illegal dumping of oil and hazardous substances. See Kauffman, M and Mosley, D. (2003). *M/V Kimton: A Case Study of The U. S. Coast Guard's Abandoned Vessel Program*. International Oil Spill Conference Proceedings: April 2003, Vol. 2003, No. 1, pp. 571-753.

jurisdictional authority, identifying an owner/operator or lessee, and evaluating the potential for removal.[21] Additional challenges include the demanding nature of vessel removal and/or mitigation of the wrecks and abandoned vessels. Because no single law exists that comprehensively addresses abandoned vessels, OSCs/COTPs in many cases will need to work collaboratively with other agencies, paying careful attention to each law's limitations.

The ultimate disposition of the vessel and/or wreckage is also a challenge. While some intact vessels may retain positive value and could be sold at auction, another insolvent owner may take possession and create another problem at a later time. Proper vessel disposal and management options are limited and costly, resulting in some vessels being seized and auctioned, rather than being dismantled for recycling or scrapping, used for an artificial reef, or disposed of on land. Several high profile vessels, including the F/V DEEP SEA in Whidbey Island, Washington, went through a series of insolvent owners before sinking and ultimately being dismantled and disposed of by the Washington State Department of Natural Resources (DNR). Environmental concerns about the fate of the wastes are an important consideration when determining the ultimate disposition option for a specific abandoned vessel, as many older vessels contain oily sludge, asbestos, and other hazardous substances.

2.3 CONSIDERATIONS AND ASSUMPTIONS

Regional and geographic concerns were considered in the development of this document, including environmental sensitivity, threat to public and maritime commerce, stakeholder concerns, and frequency of occurrence of incidents. Case studies and technical reports from across the U.S. and its territories were evaluated to address the topic as broadly and accurately as possible. This Guidance examines existing international treaties and federal and state statutes to create a broader awareness of the range of requirements currently applicable to abandoned vessels. Awareness of these laws also promotes partnerships in the mitigation and removal of these potential threats from the navigable waters of the U.S.

It is assumed that vessels discussed within this document are abandoned. Abandoned and derelict are two terms commonly used to describe vessels of significant disrepair and without ownership. Although the definition of each term can vary, especially in state programs, for the purposes of this document, the terms are as follows:

- ***Abandoned*** refers to "the surrendering of all rights to a vessel (or other obstruction) and its cargo by the owner, or owners if vessel and cargo are separately owned." See Section 1.0 for specific language.
- ***Derelict*** refers to a vessel with an identifiable owner that has been left unattended and is in significant disrepair, such that may affect the seaworthiness of the vessel or affect the safety of the public or the environment. The term derelict is most commonly used in state statutes and varies from state to state. Derelict should be considered as a stage along the vessel's lifespan decline toward abandonment.

Although some of the authorities discussed in this guidance may also be used to respond to "derelict" vessels where there may still be a viable owner/operator, the focus of this guidance is on the management of abandoned vessels because they create additional challenges due to the lack of an owner/operator. The term "abandoned" is what nearly all federal statutes use to authorize removal if it relates to a navigational hazard. CERCLA and CWA do not use the term "abandoned." Rather, the trigger for taking a response action to address a "vessel" (abandoned or not) under these Acts is generally based on the risk to public health or the environment from the release or substantial threat of a release of a hazardous substance, or discharge or substantial threat of a discharge of oil.

[21] This activity is consistent with recommendations by the 1992 Government Accountability Office (GAO) Report "Abandoned Vessels Are Polluting the Waterways."

Section 3.0 Initial Assessment

3.1 INTRODUCTION

The initial assessment of an abandoned vessel is the first and arguably most critical element of the response. The information gathered during this phase will help determine which authorities are applicable, the most appropriate action to be taken, what funding can be used, and, if necessary, what methods of vessel removal or pollution mitigation are most appropriate under the circumstances. It should be noted that OSCs may need to gain access to the abandoned vessel to conduct the initial assessment and, later, the response. While Section 4.0 describes various access authorities under the federal response authorities, it is beyond the scope of this Guidance to address physical access authorities in significant detail. Additional information and detail is available in EPA and USCG internal guidance documents.

Abandoned vessels may range considerably in size and type of service, with the complexity of the response generally increasing proportionately with the size of the vessel. Notwithstanding, there are common initial assessment questions that would help responders characterize the response complexity and resources at risk, regardless of the vessel's size.

3.1.1 Initial Field Assessment

Initial Assessment Considerations

- Vessel location (moored, stranded, at anchor, or submerged)
- Vessel load and threat of pollution
- Is the vessel posing an obstruction to navigation? [22]
- Owner/operator or lessee information (some vessels are well known, long-time derelicts)
- Physical construction and condition (wood, steel, fiberglass, or composite)
- Potential link to illegal activities
- Vessel type (fishing vessel, yacht, etc.)
- Size/vessel tonnage (over or under 100 displacement tons)
- Propulsion type (e.g., sail or motor)
- Flag state of vessel (foreign flagged vessels may need to be assessed under international regimes)
- Sensitive habitat or protected resources
- Potential historic preservation and gravesite status[23]

Below is an expanded discussion of some of these initial assessment elements.

Vessel Location

The OSC/COTP should obtain a latitude/longitude for the vessel, accurate depth (if submerged), and a general geographic description of the area where the vessel is located. Coordination with the local USACE district office will provide much of this information. USACE districts have survey equipment and other resources needed for this determination. If the vessel lies in or is immediately adjacent to a federal navigation channel and poses a potential hazard to navigation, removal oversight is provided by the USCG or USACE within their specific navigation authorities. Both agencies will collaborate and determine who leads the removal oversight and the appropriate action(s) to be taken.

[22] See 33 U.S.C. § 245.20(b) for a list of factors used by USACE to determine whether a wreck is a hazard to navigation.
[23] The State Historic Preservation Officer and any relevant tribes should be contacted about potential impacts to historical and cultural resources.

The OSC/COTP should study the area and become familiar with geographic and bathymetric features (including cable areas or submerged piping), environmentally sensitive areas, infrastructure (including nearby piers and haul-out facilities), and port facilities that could be impacted or be of use in a response and/or removal of the vessel. Determine whether the vessel is within state waters because state/local agencies may not be able to assist if outside of state waters.

In the case of a beached vessel, determine whether the vessel needs to be secured to shore to keep it from drifting away on the next tide. If the vessel appears in danger of becoming adrift, the owner, operator, or lessee should be notified that the vessel should be secured (within safe means).[24] Further, identify navigational concerns and proximity to navigational channels/byways, mooring fields, marinas, and any other higher traffic areas. These factors may affect the urgency of the response or the need to warn the public of the location of the vessel. Beached vessels are an attraction to persons who can access the vessel and may pose significant safety issues. An immediate assessment of the risk the vessel presents to human health should also be conducted. In non-emergency situations, it may be necessary to conduct periodic environmental and site assessments in the vicinity of abandoned vessels, performing these activities during routine harbor patrols.

In any case, responders should be aware of the issue of access to private property. If there is any question as to rights of access, ensure that appropriate law enforcement officials accompany response personnel during assessment activities. Entry to spaces that are locked should only be conducted in accordance with specific agency policies regarding private property access.

Vessel Load and Threat of Pollution

The OSC/COTP should identify the capacity of the fuel tanks, as well as other cargo aboard that may be considered oil or hazardous substances—for example: batteries, paint, hydraulic fluid in gear or stored, engine/generator crank case oil, propane tanks, and/or packaged cleaners. A lack of oil or hazardous substances aboard may limit response and removal options, which is discussed further in later sections of this Guidance. It is essential to consult with partner agencies, such as harbormasters, state marine patrol, state environmental responders, local fire departments, and federal partners such as EPA, NOAA, USCG, and USACE. These agencies may already have detailed information about the vessel in question or the resources needed to obtain this detailed information. Local fish and game wardens may also be a potential resource.

Obstruction to Navigation

To the extent authorized by statute or regulation,[25] OSCs/COTPs should consider whether the abandoned vessel poses an actual obstruction to navigation or poses a potential hazard to navigation under conditions that may be reasonably anticipated to occur. In a 2004 District Court opinion, the District Court examined the Wreck Act, which allows USACE to remove a wreck without liability for any damage to the owner thereof when, in its sound discretion, it determines that navigable waters of the U.S. are obstructed or endangered by any wreck.[26] The court explained that "the Corps may act if a sunken vessel endangers, i.e.., poses a potential hazard to navigation under conditions which may be reasonably anticipated to occur… "[27] The USCG and USACE signed a Memorandum of Understanding (MOU) on October 5, 2012, which outlines procedures for making determinations of hazards to navigations and coordinating mitigation actions when a hazard to navigation exists. The 2012 MOU replaces a Memorandum of Agreement (MOA) of October 1985 between USCG and USACE to mitigate hazards to navigation. USACE issued regulations, 33 C.F.R. Part 245 (Removal of Wrecks and Other Obstructions), describing the administrative procedures and policy it uses in exercising its authority for wreck removal. The procedures are intended to ensure that the impacts of obstructions are minimized, while recognizing

[24] USCG should not, as a general practice, engage in anchoring vessels.
[25] See, e.g. 33 C.F.R. 110.
[26] U.S. v. Rafael, 349 F. Supp. 2d 84, 95 (D. Mass. 2004)
[27] Id.

certain rights of owners, operators, and lessees.[28] The jurisdiction to exercise authority under this statute extends inland on navigable waters as defined in 33 C.F.R Part 329, beyond what are traditionally the coastal and inland OSC zones under CWA. (An EPA OSC addressing an abandoned vessel in the inland zone would coordinate with USACE and USCG, as appropriate, on the evaluation of whether the vessel poses an obstruction to navigation.)

Owner/Operator Information

Identifying the owner, operator, or lessee is a critical part of the removal effort. Responders should get the name, address, e-mail (if available), and phone/cell numbers for the owner and any relevant operators if possible. Insurance is another key piece of information to seek as quickly as possible. In the case of fishing vessels, the local USCG courtesy commercial fishing vessel safety examiner may have detailed information on the vessel and crew. Owner or operator information may be captured from law enforcement databases and programs such as Accurint®, Lexis Nexis®, and Marine Information Safety and Law Enforcement (MISLE), and may also be compiled from local marina operators and municipal law enforcement. If the craft at issue is a qualifying "abandoned barge," USCG may take action under the Abandoned Barge Act as discussed in the next chapter, including assessing penalties and removing the barge.

Physical Construction and Condition

The OSC/COTP should ascertain the hull material--wood, fiberglass, steel, or composite--and its condition. Determining the hull material, condition of the vessel, and its stability and structural integrity are vital components in assessing the overall safety of any response operation. This applies to floating as well as grounded and submerged vessels. Divers investigating the wreck and responders conducting cleaning operations will need to know the condition of the vessel in order to determine whether it is safe to go in or aboard the vessel.

Assessing the overall structural integrity of the vessel may be important in determining what type and capacity of equipment may be needed and whether it is feasible to successfully raise and/or remove a vessel, especially if the vessel is water-logged or full of sediment. Responders should be prepared for an intact vessel to come apart when raised or moved, so they can deal appropriately with the changed circumstances that come with floating or submerged debris. Debris and vessel gear such as fishing rigging and nets may pose a risk to responders, divers, and wildlife.

Potential Link to Illegal Activities

Responders should be mindful that abandoned vessels can be havens for illegal activity. Typically, this means that abandoned vessels could serve as sites to illegally discard pollution or other waste materials, but this could also mean other illegal activities. During the 2012 grounding of the foreign freight vessel M/V JIREH on Mona Island, Puerto Rico, the vessel was found to be carrying numerous illegal immigrants as well as drugs smuggled in ballast tanks. If there are any concerns, responders should contact local law enforcement for any information that can be obtained about the vessel prior to sending investigators or responders aboard.

The government has a broad range of enforcement tools. Frequently, a decision on the best enforcement option can be made only after all of the key facts are known and evaluated. Evidence from abandoned vessel investigations may later be used in a criminal case. The decision as to whether there is evidence of a criminal offense might not be made until after the initial boarding has taken place. Therefore, the federal official removing an abandoned vessel should ensure that any potential evidence is collected and maintained in such a manner as to preserve any evidence that may be useful in any subsequent criminal investigation or civil proceeding.

[28] 53 FR 27511-02, 1988 (21 July 1988) (Final Rule on Removal of Wrecks and Other Obstructions)

Sensitive Habitat or Protected Resources

In certain situations, oil pollution may not be the primary environmental concern. For example, grounded vessels may damage coral, sea grass, other sensitive marine habitats, and irreplaceable historical and cultural marine resources. Resource trustees should be incorporated into any response planning to help educate others and help protect sensitive species and ecosystems. Other threats from abandoned vessels may include antifouling paints, invasive species, nutrient enrichment from rusting steel, dispersion of fishing gear that may entangle marine life, and/or marine debris if the vessel is allowed to deteriorate in place.

In the aforementioned circumstances, natural resource trustees should ensure key response priorities are established and objectives met, which include:

- *Identify and Prioritize Resources at Risk* – Resource trustees can act as a supplement to the applicable ACP information on sensitive resources. Trustees provide local knowledge relevant to area natural resources and the risks posed to them.
- *Evaluate Protective Measures and Cleanup Strategies* – During a discharge or threatened discharge, resource trustees are ideal members for Shoreline Cleanup Assessment Teams and are vital to the development of cleanup endpoints.
- *Post-Cleanup Evaluations* – Trustee input in final sign-off during post-cleanup evaluation is desired in a response. Trustees should provide information pertinent to federal lands and resources under their care.
- *Manage Endangered Species Act (ESA) Consultation and Essential Fish Habitat (EFH) Issues* – Trustees should ensure any applicable consultation issues with regards to ESA and EFH are addressed in a timely manner.
- *Consultations Requirements* – OCSs should ensure consultations are conducted for the Marine Mammal Preservation Act (MMPA), National Marine Sanctuaries Act (NMSA) and NHPA.
- *Wildlife Rehabilitation* – Trustees should work with OSCs to ensure appropriate permits are obtained and organizations are contacted when working with injured wildlife and resources during a response. Trustees should provide guidance to OSCs to ensure wildlife response plans are implemented appropriately.[29]
- *Invasive Species* – Trustees can help determine the possible presence of invasive species in cases where foreign or domestic vessels are abandoned within U.S. protected waters. Invasive species include not only species introduced from ballast water, but also rats and other non-aquatic nuisance species that may be found on the hull. Some inland areas could have significant concerns about invasive plants and mussels that could be inadvertently transported if a vessel or debris is transported out of the immediate watershed.[30]

Through federal action and by encouraging the establishment of state programs, ESA[31] provides for the conservation of ecosystems upon which threatened and endangered species of fish, wildlife, and plants depend. The Act:

- Authorizes the listing of species as endangered and threatened;
- Prohibits unauthorized taking, possession, sale, and transport of endangered species;

[29] NRT. (1998). *Federal Natural Resource Trustees and the ICS [Incident Command System]/UC [Unified Command]*. Retrieved from http://www.nrt.org/Production/NRT/NRTWeb.nsf/AllAttachmentsByTitle/A-51FRNT/$File/FNRT.pdf?OpenElement

[30] The Aquatic Nusiance Species Taskforce is chaired jointly by the NOAA and the U.S. Fish and Wildlife Service (USFWS).

[31] 16 U.S.C. § 1531, et seq.

- Provides authority to acquire land for the conservation of listed species;
- Authorizes establishment of programs for endangered and threatened wildlife and plants; and
- Authorizes the assessment of civil and criminal penalties for violating the Act or regulations.

Section 7(a)(2) of the ESA requires OSCs to ensure any action authorized, funded, or carried out is not likely to jeopardize the continued existence of any listed species or destroy or adversely modify their critical habitat. Under ESA implementing regulations at 50 C.F.R. Part 402, consultation with the National Marine Fisheries Service (NMFS) and/or the USFWS is required for actions that may affect listed species or designated critical habitat.[32,33]

Potential Historic Preservation Status

Written approval from the appropriate State Historic Preservation Office (SHPO) is a requirement for vessels over 50 years old. An established Programmatic Agreement provides detailed guidance on protection of historic properties during emergency responses under the NCP.[34] The provisions of the Programmatic Agreement and implementing plans will apply in lieu of the provisions of 36 C.F.R. Part 800.

3.1.2 Government Collaboration

There are a host of federal, state, local, and tribal resources available to assist with the initial assessment of abandoned vessels. The USCG maintains vessels capable of transporting responders and investigators to the scene of a vessel. Use of these assets *may be available* depending on current operations, and can be coordinated via the nearest USCG Sector Command Center. The USACE district office has survey vessels for federal navigation channel condition surveys. OSCs should coordinate with their local USACE district office to determine whether an abandoned vessel is in or adjacent to a federal navigation channel. NOAA may be able to provide more detailed bathymetry than available on the chart, or arrange sonar surveys of wrecks. NOAA vessels run surveys of coastal areas, and responders may be able to have a NOAA ship in the vicinity of a wreck divert to survey the site. NOAA's six Navigation Response Teams are highly mobile and can be deployed to do specialized surveys for emergencies such as opening ports or in support of a response or salvage activity. Other federal agencies or offices (such as the Navy Supervisor of Salvage and USACE) have agreements to assist in federal navigation channel vessel or obstruction removal and disposal as needed.

State environmental responders and law enforcement (e.g., departments of environmental protection, state marine patrol, and state police) typically maintain vessels capable of investigating vessel sites as well. In particular, they may have shallow draft vessels with trailer capability that can bring investigators to very shallow areas not accessible from shore. Local harbormasters, police, and/or fire departments are also available resources. Further, state and local law enforcement or other agencies may have dive teams available to assist with the investigation. For example, the City of Boston Police Department has aided in the investigation of submerged barges in Boston Harbor in conjunction with the USCG.

[32] 16 U.S.C. § 1536.(a)(2). The lead action agency is responsible for ESA compliance. In accordance with *Inter-agency [MOA] Regarding Oil Spill Response Activities under FWPCA, NCP, and ESA*, NOAA NMFS, and [U.S. Department of Interior] DOI USFWS would be consulted where the response may affect listed species/critical habitat. The NOAA Scientific Support Coordinator (SSC) often helps the federal OSC determine what resources are at risk and what consultations need to be conducted.

[33] ESA consultation can also include the Office of National Marine Sanctuaries in the National Ocean Service in NOAA when actions are either in or could impact national marine sanctuaries.

[34] "Programmatic Agreement on Protection of Historic Properties During Emergency Response Under the NCP," June 1997.

Section 4.0 Response Authorities

4.1 INTRODUCTION

When the initial assessment discussed in Section 3.0 is complete, the OSC/COTP should have a better understanding of the threat posed to public health, the environment, and navigation and can select the appropriate authorities under which the vessel problems/dangers/damage can be mitigated. Several federal statutes and regulations govern the mitigation of pollution from and the removal of abandoned vessels and wrecks posing a threat to the navigable waters, including the territorial seas of the U.S. This section explains how the relevant federal laws and regulations relate to the OSC/COTP's authority to mitigate pollution and remove abandoned vessels.

4.2 FEDERAL STATUTES AND REGULATIONS

The statutes and regulations listed below are the primary authorities that facilitate federal action in addressing abandoned vessels. Depending on the circumstances at hand, other authorities may be relied on to mitigate damage from or otherwise address abandoned vessels. The synopses provided below offer a brief explanation of how the authorities relate to abandoned vessel response and should not be relied on as complete summaries of the listed authorities, nor relied upon to interpret these authorities. In any case where these authorities are relied upon, legal counsel should be consulted.

Table 1 – List of Federal Statutes Related to Abandoned Vessel Response and Disposition Options

46 U.S.C. § 4701-4705: *Abandoned Barge Act*

The Abandoned Barge Act authorizes USCG OSCs to remove an abandoned barge under specific circumstances. This statute applies to navigable waters of the U.S. including territorial seas as provided in Section 1 of this Guidance. Pursuant to § 4701, "abandon means to moor, strand, wreck, sink, or leave a barge of more than 100 gross tons unattended for longer than forty-five days." Further, the Act initiates civil penalties and outlines removal and destruction procedures. The authority to remove a barge under this statute does not include the removal of pollutants.

43 U.S.C. § 2101-2106: *Abandoned Shipwreck Act*

Under the ASA, the U.S. declares title to abandoned shipwrecks located in the submerged lands of a state. The federal government then transfers the title to the state whose submerged lands contain the shipwreck.[35] Protected shipwrecks under state care can provide opportunities to recreational divers, tourists, and researchers. Public access to the shipwrecks may be encouraged by states through the creation of underwater parks.

The National Park Service (NPS) publishes guidelines for states and agencies for the development of shipwrecks as cultural resources. The effort facilitates access and utilization of the shipwrecks by a variety of organizations and interest groups including divers and research organizations. The OSC/COTP should consult with the NPS before conducting removal of pollutants from protected wrecks. Consultation is required of all federal agencies undertaking an "action" under Section 106 of the NHPA. USCG has a specific programmatic agreement that addresses this consultation process. Consultation under Section 106 is with the State and Tribal Historic Preservation Officers and may also include the Advisory Council on Historic Preservation, DOI, NOAA, the U.S. Maritime Administration (MARAD), and Department of Defense (DOD). In addition, there may be additional requirements under the Sunken Military Craft Act.

42 U.S.C. § 9601-9675: *Comprehensive Environmental Response, Compensation, and Liability Act*

CERCLA, like the CWA, provides for the removal of hazardous substances when there is a release or substantial threat of a release to the environment, including from abandoned vessels. CERCLA § 104(a)(1) directly authorizes responders to remove or arrange for the removal, or take any other response measures to remove or mitigate a hazardous substance, pollutant, or contaminant when:

> (a) any hazardous substance is released or there is a substantial threat of such a release into the environment, or
>
> (b) there is a release or substantial threat of release into the environment of any pollutant or contaminant which may present an imminent and substantial danger to the public health or welfare. [36]

In situations when a facility or vessel, which is the source of a release, is under the jurisdiction, custody, or control of DOD or the Department of Energy (DOE), the response authority resides within that agency.[37] For other federal agencies, the response authority resides with that agency, except for emergencies.

The federal OSC's CERCLA response authorities are detailed within the NCP.

33 U.S.C. § 1251-1387: *Federal Water Pollution Control Act , commonly known as Clean Water Act, as amended by the Oil Pollution Act of 1990*

CWA Sections 311 (c) and (e) provide authority to remove pollutants from potentially polluting sources, including abandoned vessels. CWA has been amended a number of times. The amendments, in addition to the NCP implementing regulations, all contribute to the OSC's authority. This section explains the pertinent provisions from each amendment. The NCP will also be discussed further below.

CWA authority described here applies to a discharge or substantial threat of a discharge of oil and/or hazardous substances. It is important to note the removal of oil and hazardous substances is conducted using separate funding mechanisms – the Oil Spill Liability Trust Frund (OSLTF) and the CERCLA fund, respectively.

[35] Except when the wreck is located on public or Indian land, or is a U.S. warship that has not been affirmatively abandoned.
[36] 42 U.S.C. § 9604
[37] Executive Order (E.O.) 12580 (1987)

Removal authority for oil pollution threats comes from CWA § 311(c), as amended by OPA 90 § 4201, and in accordance with the NCP, 40 C.F.R. Part 300.305(d)(1) to:

- Remove or arrange for the removal of a discharge, and mitigate or prevent a substantial threat of a discharge, at any time;
- Direct or monitor all federal, state, and private actions to remove a discharge; and
- Remove and, if necessary, destroy a vessel discharging, or threatening to discharge, by whatever means are available.

The removal authority for the inland zone has been delegated to the EPA Administrator under E.O. 12777.[38] EPA has further re-delegated this authority to the EPA Regional Administrators (RAs). The RAs have re-delegated the authority to the Regional Division Directors that manage the removal programs and, in most cases, have re-delegated the authority directly to the individual OSCs. E.O. 12777 also delegated the removal authority for the coastal zone to the Secretary of the Department in which the USCG is operating. This authority has been further delegated to the Commandant and re-delegated further to pre-designated OSCs under 33 C.F.R. Part 1.01-80. However, it should be noted that under 33 C.F.R Part 1.01.-80 the Commandant has not delegated authority to remove or destroy a vessel and such OSC/COTP actions require Commandant approval.

Under the NCP, EPA and the USCG have the same authority for response to abandoned vessels, but EPA generally has the lead for discharges or releases into or threatening the inland zone and USCG has the lead in the coastal zone, as agreed upon between an EPA Region and the USCG District for a given area and identified in federal Regional Contingency Plans (RCPs).[39,40] The specific delineation is known as a Response Boundary and the geographical area as an Area of Response. CWA authorizes the OSC to remove or arrange for "the removal of a discharge or a substantial threat of a discharge of oil or a hazardous substance into navigable waters; on the adjoining shoreline; into or on the waters of the Exclusive Economic Zone (EEZ); or that may affect natural resources of the U.S."

Under Section 404 of the Clean Water Act, Department of Army authorization is required for the discharge of dredged and/or fill material into waters of the U.S., including wetlands. Cleanup, vessel removal, excavation, and vessel disposal activities may require the discharge of fill material which may result in temporary or permanent impacts to waters of the U.S. It may be necessary for the OCS to obtain any required authorizations from the relevant USACE district regulatory office under Section 404 of the CWA, and/or any other applicable laws and regulations unless otherwise exempted.

40 C.F.R. Part 300: *National Oil and Hazardous Substances Pollution Contingency Plan*

The purpose of the NCP, under 40 C.F.R. Part 300.3(b), is:

> "[Providing] for efficient, coordinated, and effective response to discharges of oil and releases of hazardous substances, pollutants, and contaminants in accordance with the authorities of CERCLA and the CWA." It provides for: "(b)(3): Procedures for undertaking removal actions pursuant to Section 311 of the CWA."

Except in a case when the OSC is required to direct the response to a discharge of oil, the OSC may allow the responsible party (RP) to voluntarily and promptly perform removal actions, provided the OSC determines such actions will ensure an effective and immediate removal of the discharge or mitigation or prevention of the substantial threat of discharge. The OSC is also authorized to direct all response actions, including arranging for the removal, by whatever means available, of the substantial threat of discharge

[38] Section 3 of E.O. 12777 delegated removal authority for both coastal and inland zones to USCG and EPA, respectively.
[39] 40 C.F.R. § 300.120(a)
[40] 40 C.F.R. § 300.210(b)

(including from a wreck).[41] The NCP provides clear response direction, specifically authorizing the OSC to address and remove a vessel, if necessary, to mitigate or prevent substantial threats of discharge.[42]

To stabilize the situation and limit further damage, the NCP directs OSCs to ensure proper measures are taken to secure the source of the spill and remove any remaining oil to prevent additional discharge, minimize continued response action in the future, and lessen the impacts to the environment.[43,44]

33 U.S.C. § 1471-1487: *Intervention on the High Seas Act*

IHSA provides that "federal intervention actions" occur "Upon determination of a grave and imminent danger to the coastline or related interest of the [U.S.]," and authorizes the USCG to ". . . remove or eliminate threatened pollution damage" and "…remove, and if necessary, destroy the ship and cargo which is the source of danger."[45] "Ship" is defined as "(A) a seagoing vessel of any type whatsoever, and (B) any floating craft, except an installation or device engaged in the exploration and exploitation of the resources of the seabed and the ocean floor and the subsoil thereof."[46] CERCLA authorizes funds for high seas intervention activities. High seas refers to waters seaward of the territorial seas of the U.S.[47]

The International Convention Relating to Intervention on the High Seas in Cases of Oil Pollution Casualties was adopted in 1969 and allows a coastal nation to take defensive action against a vessel on the high seas where pollution by oil is threatened. IHSA gives USCG intervention authority in circumstances when a ship is threatening to spill crude oil, fuel oil, diesel oil, or lubricating oil into the seas. Further, USCG has the authority to take measures on the high seas to mitigate such dangers.

The U.S. has implemented the Intervention Convention by enacting IHSA, which authorizes actions that may be taken in the case of imminent danger to the coastline or related interests of the U.S. from pollution or threat of pollution. The measures taken to abate the pollution must be proportionate to the damage (actual or threatened).[48] If actions are not proportionate to the threat, the U.S. or other coastal nations will be liable for damages caused.

Before intervening, the Secretary of the Department of State must consult with the flag state of the ship involved. Also, the Secretary must consult with any other agency or persons whose interests can be reasonably expected to be affected by the proposed measures, except in cases of extreme emergency.

The Commandant is charged with coordinating and directing all public and private efforts designed to remove or eliminate the threatened pollution; to undertake the whole or any part of any salvage operation of the polluting vessel; and to remove and destroy the ship and the cargo that is the source of the damage.

33 U.S.C. § 1951-1958: *Marine Debris Act*

The Marine Debris Act is a key statute for studying and addressing the problem of marine debris in all of its forms. "Marine debris" is defined in the Act to include abandoned vessels as follows: "any persistent solid material that is manufactured or processed and directly or indirectly, intentionally or unintentionally, disposed of or abandoned into the marine environment or the Great Lakes." The Act establishes a program within NOAA to address the adverse impacts of marine debris on the U.S. economy, the marine environment, and navigation safety through identification, determination of sources, assessment, prevention, reduction, and removal of marine debris. The Act mandates that through the Program, and

[41] 40 C.F.R. § 300.305(d)
[42] 40 C.F.R. § 300.305(d)(1)(iii)
[43] In most oil spill response and removal cases, an OSC will have an identifiable RP and will be responsible for monitoring the response actions of the RP.
[44] 40 C.F.R. § 300.317
[45] 33 U.S.C. § 1474
[46] See 33 U.S.C. § 1471(5)
[47] 33 C.F.R. § 2(c)
[48] The OSLTF, established by CWA, is available for intervention activities under the IHSA.

subject to the availability of appropriations, NOAA shall undertake marine debris identification, assessment, reduction, prevention, and removal activities, as well as provide outreach and education on marine debris. NOAA primarily meets the mandate for removal via community-based removal grants. The Act also establishes a program within USCG to reduce violations and improve implementation of the International Convention for the Prevention of Pollution from Ships (MARPOL) Annex V, as well as plans to improve ship-board waste management. NOAA administers the Act and responds to marine debris, including debris generated by natural disasters. NOAA responds by providing scientific support, coordination, and information sharing along with limited removal.

The Marine Debris Act re-establishes the Interagency Marine Debris Coordinating Committee (IMDCC), of which NOAA is the Chair and EPA is the Vice-Chair. IMDCC is an interagency body responsible for developing and recommending comprehensive and multi-disciplinary approaches to reduce the sources and impacts of marine debris to the nation's marine environment, natural resources, public safety, and economy. The IMDCC ensures the coordination of federal agency marine debris activities both nationally and internationally, as well as recommends research priorities, monitoring techniques, educational programs, and regulatory action.

33 U.S.C. § 1401-1445: *Marine Protection, Research, and Sanctuaries Act (Title 1)*

The MPRSA, also known as the Ocean Dumping Act, regulates the dumping of all types of materials into ocean waters and strictly limits the dumping of any material that would adversely affect human health, welfare or amenities, marine environment, ecological systems, or economic potentialities.[49] Title I of the Act generally prohibits (1) transportation of material from the U.S. for the purpose of ocean dumping; (2) transportation of material from anywhere for the purpose of ocean dumping by U.S. agencies or U.S. flagged vessels; and (3) dumping of material transported from outside the U.S. into the U.S. territorial sea. A permit is required to deviate from these prohibitions. Under MPRSA, the standard for permit issuance is whether the dumping will "unreasonably degrade or endanger" human health, welfare, or the marine environment. Evaluation of whether degradation would be unreasonable or cause endangerment requires consideration of alternatives to ocean disposal, including land-based alternatives.[50]

EPA is the MPRSA permitting agency for all materials except dredged material. (In the case of dredged material, the decision to issue a permit is made by USACE, using EPA's environmental criteria and subject to EPA's concurrence.) EPA has issued a general permit under the MPRSA for the transportation and disposal of vessels. The MPRSA implements the requirements of the 1972 London Convention on the Prevention of Marine Pollution by Dumping of Wastes and Other Matter (London Convention), the international ocean dumping treaty. The U.S. Government reports the ocean dumping of vessels to the International Maritime Organization pursuant to the London Convention. [51]

16 U.S.C. § 1431 et seq: *National Marine Sanctuaries Act*

Under the NMSA, NOAA manages a system of 14 marine protected areas in U.S. waters. The statute provides NOAA the authority to address any activities that are likely to destroy, cause the loss of or injure sanctuary resources. For some sites within the system, this authority includes activities that occur outside the boundaries but that could enter and injure sanctuary resources.

Within these sanctuaries, NOAA can seek damages from responsible parties to cover response, injury and damage assessment, restoration, and replacement of the injured habitat or acquisition of equivalent habitat, and compensation of the public for the value of the injured resources until full recovery. Under the NMSA, NOAA may have financial resources available to assist with the response, particularly if there is no longer a nexus to OPA 90 or CERCLA.

[49] 33 U.S.C. § 1402(b)
[50] 33 U.S.C. § 1412(a)
[51] The USCG's role under the MPRSA is primarily related to certain enforcement activities. See, 33 U.S.C. 1417.

The NMSA also requires consultation under Section 304(d) for any activities that are "likely to destroy, cause the loss of or injure a sanctuary resource." During consultation, NOAA may recommend reasonable and prudent alternatives to protect sanctuary resources and to address activities that conflict with site-specific activities such as disturbance of the seabed, and discharge or deposit of materials that could occur during assessment or removal activities.

33 U.S.C. §409, 411, 412, 414, and 415: *Wreck Act*

The Rivers and Harbors Appropriation Act of 1899 (RHA) contains several sections known as the Wreck Act, which provides USACE the authority to remove sunken vessels that pose an obstruction to navigation. This statute applies to navigable waters of the U.S. as provided in Section 1 of this Guidance and provides authority to respond beyond traditional OSC/COTP inland and coastal zones as provided by the NCP. Under the Wreck Act, the owner, operator, or lessee of a submerged vessel is responsible for immediately marking the vessel with a buoy or beacon during the day and a lighted lantern at night.[52] The markings must remain until the vessel is removed. The owner, operator, or lessee is also required to "diligently" commence "immediate" removal of the submerged vessel. If the vessel is not removed within thirty (30) days, it will be considered abandoned and USACE may take action to remove the vessel from the navigable waters.[53] The determination of whether a wreck poses an obstacle to navigation rests initially with USACE and a reviewing court will only overturn the determination if the decision is found to be arbitrary and capricious.

If USACE determines the existence of the submerged or wrecked vessel in the navigable waters of the U.S. is creating an emergency situation, the vessel owner, operator, or lessee will be given twenty-four (24) hours to begin removal of the vessel using the most expeditious method available.[54] If the vessel is not removed or steps are not taken in an expeditious manner to secure the vessel's removal, USACE may intercede to remove, sink, or destroy the vessel to alleviate the situation. The vessel owner, operator, or lessee will then be liable to the U.S. for all costs associated with the government's action. If the owner fails or refuses to reimburse the government within thirty (30) days after notification, the vessel may be sold with the proceeds going to the U.S. Treasury.[55]

Under Section 10 of the Rivers and Harbors Appropriation Act of 1899, Department of Army authorization is required for work or structures in, over, or under navigable waters of the U.S. or that otherwise affects the course, location, or condition of such waters. In addition, the cleanup, vessel removal, and vessel disposition activities may be regulated. The entity proposing to undertake the activity may need to apply for and receive authorization from the relevant USACE district regulatory office prior to commencing these activities.[56] It may be necessary for the OCS to obtain any required authorizations from the relevant USACE District Regulatory Office under Section 10 of the RHA, and/or any other applicable laws and regulations unless otherwise exempted.

33 C.F.R. Part 245: *Removal of Wrecks and other Obstructions*

33 C.F.R. Part 245 implements provisions of the Wreck Act, as amended by the Water Resources Development Act of 1986, and also reflects the procedures from an interagency agreement between USACE and USCG. The Water Resources Development Act of 1986 (Pub. L. No. 99-662 §939) amended the Wreck Act by extending jurisdiction to non-negligent sinkings, extending the obligation for marking and removal to vessel operators and lessees (in addition to owners), and providing for reimbursement to the U.S. Treasury for full costs of federal removal and disposal.

[52] 33 U.S.C. § 409
[53] 33 U.S.C. §§ 409 & 414
[54] 33 U.S.C. § 415: *RHA, (*b) Removal Authority
[55] Cases such as HOVIC III, Steel oil barge. M/V Baltic Sun, Steel hull freighter. Both removed from Christiansted, U.S. Virgin Islands (USVI) in 1992.
[56] 33 U.S.C. § 403

The USACE criteria for determining a hazard to navigation when evaluating the removal of an abandoned or wrecked vessel under these regulations are found below.

Upon receiving a report of a wreck or other obstruction, District Engineers will consult with the USCG District to jointly determine whether the obstruction poses a hazard to navigation. The factors considered in determining a hazard to navigation may, at a minimum, include:

- Location of the obstruction in relation to the navigable channel and other navigational traffic patterns.
- Navigational difficulty in the vicinity of the obstruction.
- Clearance or depth of water over the obstruction, fluctuation of water level, and other hydraulic characteristics in the vicinity.
- Type and density of commercial and recreational vessel traffic, or other marine activity, in the vicinity of the obstruction.
- Physical characteristics of the obstruction, including cargo, if any.
- Possible movement of the obstruction.
- Location of the obstruction in relation to existing aids to navigation.
- Prevailing and historical weather conditions.
- Length of time the obstruction has been in existence.
- History of vessel accidents involving the obstruction.

After a determination has been made that an obstruction presents a hazard to navigation, District Engineers will consult with the USCG District to determine the appropriate remedial action for the specific situation. Any combination of the following, as noted in 33 C.F.R. § 245.25, may be considered:

- *Charting*
- *Marking*
- *Redefinition of navigational area* (e.g., channel, fairway, or anchorage)
- *Removal*[57]
- *Broadcast notice to mariners and publication of navigational safety information* (regarding location of abandoned vessel or wreck)
- *No Action*

The marking of wrecks, regulated under 33 C.F.R. Part 64, is the responsibility of the USCG while removal is at the discretion of USACE.[58] The USCG and USACE signed a MOU on October 5, 2012 that outlines procedures for making determinations of hazards to navigations and coordinating mitigation actions when a hazard to navigation exists. The 2012 MOU replaces an October 1985 MOA between USCG and USACE to mitigate hazards to navigation.

10 U.S.C. § 7361 et seq: *Salvage Facilities Act*

The Salvage Facilities Act authorizes contracting of U.S. Navy Supervisor of Salvage (SUPSALV). The Salvage Facilities Act, enacted after World War II, has several objectives, including:

- To provide salvage resources to protect the redeployment of government-owned war material on chartered ships (but not in excess of national defense needs).

[57] There are several instances where USACE has removed vessels posing a hazard or at risk of posing a hazard to navigation even though the RP has the first responsibility to remove a wreck.
[58] The marking and removal of wrecks is governed by sections 15, 19 and 20 of the Wreck Act, as amended (33 U.S.C. §§ 409, 414, & 415).

- To foster (but not subsidize) the commercial salvage industry.
- To allow (but not require) the Navy to render salvage services to private vessels when commercial salvors are not available, charging for those services to support the Navy's Salvage facilities.

14 U.S.C. § 88: *Saving Life & Property*

For the protection of persons and property on the high seas and under the waters over which the U.S. has jurisdiction, 14 U.S.C. § 88 authorizes USCG to "destroy or tow into port sunken or floating dangers to navigation." This law applies to scenarios such as the Japanese F/V RYOU-UN MARU, which was intentionally destroyed by USCG in 2012.[59] The vessel, having drifted for more than a year as a result of an earlier tsunami in Japan, posed a significant danger to safe navigation and threatened to impact Alaskan shores, potentially discharging significant amounts of oil.

Other Federal Authorities

Other government agencies may have authorities when abandoned vessels are on their land or threaten lands under their care, e.g., NOAA National Marine Sanctuaries (NMS), NPS, USFWS refuges, and DOD facilities.

4.3 POST-DISASTER RESPONSE AUTHORITIES

The Robert T. Stafford Act as amended[60] (Stafford Act) provides a systematic and organized process for providing federal assistance in support of major disasters and emergencies. The Stafford Act gives the Federal Emergency Management Agency (FEMA) the responsibility for coordinating federal government-wide relief efforts.

In this section, the authorities for abandoned vessels as they apply to a major disaster or emergency, such as a major hurricane or other catastrophic event or emergency, will be defined. In a major disaster, a large number of vessels of varying sizes and types may require mitigation, and in some instances, removal. Assessments will need to be completed to accurately prioritize removal activities. To support these efforts, state programs will likely require federal assistance. In these instances, the President, at the request of the governor of the affected state and/or Chief Executive of a federally-recognized Indian tribe or nation, can make a declaration enabling access to federal aid and support under Mission Assignments. FEMA Mission Assignments will largely govern which responding agency will be responsible for the coordination of these efforts. Authorities under the Stafford Act and funding avenues are detailed in this section.

In an effort to add clarification to federal emergency assistance for removal of debris in waterways under the Stafford Act, FEMA issued Recovery Policy 9523.5, "Debris Removal from Waterways" on 30 October 2012, which states:

> "FEMA may fund the removal and disposal of eligible disaster-generated debris, wreckage, and submerged vessels from the coastal zone or inland zone, non-federally maintained navigable waterways, and wetlands by an eligible applicant, if (1) the debris, wreckage, or submerged vessel is the direct result of a Presidentially-declared disaster,[61] (2) the removal is in the public

[59] Although this case was within U.S. waters, the variables surrounding the case are comparable to those that may require invocation of IHSA.
[60] 42 U.S.C. 5121-5207
[61] 44 C.F.R. § 206.223(a)

> interest *(defined as referring actions taken for the "common well-being" or "general welfare")*,[62] and (3) another federal agency does not have specific authority to perform or fund the work."[63]

Further, FEMA Recovery Policy notes,

> "FEMA may determine that a storm-damaged vessel can be treated as eligible debris if the vessel cannot be salvaged or returned to seaworthiness and it is floating or submerged in the coastal or inland zones, a non-federally maintained navigable waterway, or wetland. However, if any part of the damaged vessel can be used to identify an owner, the applicant should contact the owner and follow its local ordinances and state laws to demonstrate legal responsibility to remove and dispose of the vessel."[64]

Oil and Hazardous Materials Response – Emergency Support Function (ESF)-10

When a Presidential Emergency or Major Disaster Declaration is made, FEMA may activate EPA and USCG to coordinate activities under ESF-10 of the National Response Framework (NRF) to address responses to hazardous substances and oil incidents caused by or threatened to be caused by a major disaster or emergency. As requested by a state or tribe, FEMA may provide a Mission Assignment to support oil and hazardous substances response and related activities, including sampling, classification, packaging, transportation, treatment, and disposal of oil or hazardous materials. The NCP generally serves as the basis for actions taken when ESF-10 is activated. During Stafford Act responses; however, some procedures in the NCP may be streamlined or may not apply. When ESF-10 is activated, an EPA OSC is typically assigned as the on-scene ESF-10 EPA Incident Commander (IC). For USCG activities, the federal OSC of the affected zone may act as the IC or may designate an incident-specific IC.

OSCs should also be aware that if a Stafford Act incident occurs involving a chemical, biological, radiological, or nuclear (CBRN) blast or explosion, which results in a CBRN-contaminated debris field that includes abandoned vessels, EPA, USACE, and FEMA have signed a MOU that delineates roles and responsibilities for contaminated debris management between ESF-3 and ESF-10.

During Stafford Act responses, if Resource Conservation and Recovery Act (RCRA) hazardous wastes, polychlorinated biphenyls (PCBs) covered by the Toxic Substances Control Act (TSCA), or other regulated wastes are generated as a result of abandoned vessel operations, then additional requirements under the relevant laws may apply.

Public Works and Engineering – ESF-3

USACE has primary responsibility for the removal of debris from federally-maintained navigable channels and waterways. Section 202 of the Water Resources Development Act of 1976 (PL 94-587) authorizes USACE to remove debris from federally-maintained commercial harbors and water areas immediately adjacent thereto. Sections 15 and 19 of the Wreck Act, authorize USACE to remove sunken vessels. Section 20 of the Wreck Act also allows USACE to remove certain other obstructions from navigable waterways under emergency conditions. A navigable waterway is one that has been authorized by Congress, and which USACE operates and maintains for general (including commercial and recreational) navigation.

USACE's policy under these authorities is to oversee removal of sunken vessels by an identifiable owner, operator, or lessee if the sunken vessel is in or likely to be moved into a federal navigation channel. USACE will remove a vessel using its emergency authorities only if the owner, operator, or lessee cannot be identified or they cannot effect removal in a timely and safe manner. Vessel removal operations

[62] 44 C.F.R. § 206.224(a)
[63] 44 C.F.R. § 206.208(c)(2)
[64] FEMA. (2012). Recovery Policy 9523.5, *Debris Removal from Waterways*. Section X.

conducted under ESF-3 will be coordinated through USACE as the primary agency and the USCG as a supporting agency, if required to assist. The Mission Assignments issued by FEMA for the removal of these vessels prescribe specific areas of operation that include navigable waterways and adjoining shorelines, as noted above in FEMA Recovery Policy 9523.5. During the recovery of debris and damaged vessels post-storm, thorough documentation of owner/operator and vessel identification information, as well as method of removal and disposal, if required, becomes vitally important.

4.4 ADDITIONAL STATUTES APPLICABLE TO ABANDONED VESSEL DISPOSITION

15 U.S.C. § 2601 – 2697: *Toxic Substances Control Act*

TSCA, among other things, provides EPA with authority to require reporting, record-keeping, and testing, and imposes restrictions relating to chemical substances and/or mixtures. Certain substances are generally excluded from TSCA including, among others, food, drugs, cosmetics, and pesticides. TSCA specifically addresses the production, importation, use, and distribution in commerce of PCBs.

Note: The reefing of a vessel containing PCBs is not authorized under TSCA or EPA's implementing regulations without an approval from EPA. If the OSC/COTP believes that reefing may be the best approach for a vessel containing PCBs, she should contact the EPA's office for PCB ship disposal issues.

42 U.S.C. § 6901 – 6992: *Resource Conservation and Recovery Act*

RCRA gives EPA the authority to control hazardous waste from the "cradle-to-grave." This includes the generation, transportation, treatment, storage, and disposal of hazardous waste. Although RCRA is a federal statute, EPA authorizes states to operate the hazardous waste program in lieu of the federal program. Currently, 48 of 50 states implement the hazardous waste program. RCRA also sets forth a framework for the management of non-hazardous solid wastes. The OSC/COTP should consult with state RCRA Coordinators for application of all relevant RCRA regulations from generation of the waste to final disposal. OSCs should also be aware that under RCRA, waste from a vessel is considered "generated" when waste is removed from the vessel (point of generation) and RCRA-specific waste management requirements may apply at the point of generation.

16 U.S.C. § 4711: *The Nonindigenous Aquatic Nuisance Prevention and Control Act of 1990 (NANPCA), as amended*

OSCs overseeing pollution removal operations should also be aware of the potential dangers to the marine environment from the introduction of nonindigenous aquatic invasive species due to either biofouled hulls/debris or the release of untreated ballast water. The threat of invasive species may be of particular concern from a recently abandoned vessel originating from a foreign port. Careful consideration should be given to the discharge of ballast into U.S. waters from these vessels.

4.5 DETERMINATION OF RESPONSE AUTHORITIES

In general, the same response authorities that apply during any other pollution threat or hazard to a navigation situation also apply to abandoned vessels and wrecks. The decision regarding what authorities can and should be used when removing an abandoned vessel or submerged wreck should be based on several criteria, including the location of the vessel, threat it poses (e.g., is it a hazard to navigation or does it pose a substantial environmental or public health threat due to pollution?), and state and/or federal statutes or regulations that may apply. In many cases, both state and federal agencies may have statutory authorities to address abandoned vessels or submerged wrecks. In these situations, the best response is a joint effort because it will allow for the sharing of resources, enforcement authorities, local environmental knowledge, and salvage expertise.

Section 5.0 Funding Authorities

Making monetary commitments on behalf of the U.S. Government before there is an appropriation or that causes an agency to exceed the amount of appropriated funds results in a violation of the Anti-Deficiency Act (31 U.S.C. § 1341). The Anti-Deficiency Act generally requires that funding be available prior to any expenditure, with possible disciplinary action resulting from violating the Act. The OSC/COTP must always be mindful of the availability and commitment of funds prior to exercising his or her authorities.

5.1 FEDERAL FUNDING

Funding available for abandoned vessels is directly related to the authorities that may apply to mitigating pollution and removing abandoned vessels, as discussed in Section 4.0. However, funding expressly for the removal of abandoned vessels is minimal among both federal and state agencies. Although there are some provisions in current law that make allowances for the removal of abandoned vessels, these provisions often have caveats that hinder the funding and thus delay prompt removal. Below is information on contracting and funding authorities and limitations for the key federal agencies involved in responding to abandoned vessels.

CERCLA Funding

CERCLA funding, which is generally limited to $2 million and 12 months per removal action unless certain statutory criteria are met, is managed by EPA and may be used to respond to a vessel if there is a release or substantial threat of a release of a hazardous substance into the environment, or if there is a release or substantial threat of a release of a pollutant or contaminant which may present an imminent and substantial danger to the public health or welfare. There are petroleum exclusions under CERCLA, but oil is covered under CWA/OPA 90 (see CWA/OPA 90 and OSTLF section below). Subject to EPA's CERCLA response delegations, once EPA determines that a removal action is appropriate, EPA OSCs have no specific delegated or internal guidance restrictions limiting their ability to remove and destroy a vessel.[65] USCG OSCs cannot make the final decision, absent further approval, to use CERCLA funding to remove a contaminated vessel from the coastal environment or destroy it.[66,67] The USCG OSC must have the Commandant's approval before using CERCLA funding to remove or destroy a contaminated vessel. However, USCG OSCs can take other types of response actions under CERCLA to address releases or potential releases of hazardous substances as well as contaminated debris that threatens the environment. In any case, the use of CERCLA funding for the purpose of removal should be carefully documented to clearly justify the use of CERCLA funds.

Section 104 of CERCLA authorizes a federal removal action for a pollution incident in the following instances:

- Whenever any hazardous substance is released or there is a substantial threat of a release into the environment; or
- Whenever there is a release or substantial threat of release into the environment of any pollutant or contaminant which may present an imminent and substantial danger to public health or welfare.

[65] EPA Delegations Manual, Delegation 14-2 (CERCLA Response), 7 November 2001
[66] 33 C.F.R. §1.01-70
[67] (U.S. Coast Guard) Commandant Instruction (COMDTINST) 16465.29. (1983). *CERCLA Response Authorities and Associated USCG Policies.*

CWA/OPA 90 and OSLTF

Similar to CERCLA, the OSLTF, also known simply as the Fund, is available to OSCs pursuant to National Pollution Funds Center (NPFC) policies and procedures when there is a discharge or substantial threat of discharge of oil to waters and shorelines or natural resources as described under CWA 311(c).

When using CWA 311(c) authority in respect to oil discharges or substantial threats, OSCs should coordinate planned activities, including any planned assessment activities, closely with NPFC case managers to ensure appropriate funding of activities to remove a discharge or prevent or mitigate a substantial threat of discharge. This is especially important where mixed purposes are being achieved in removing or destroying a vessel, e.g., CERCLA, CWA, navigation safety, disaster, or vessel debris threats to the environment.

The decision by an OSC to remove a discharge of oil or prevent or mitigate a substantial threat of discharge is based on several factors including proximity to environmentally sensitive areas, risk versus gain and other economic impacts, whether adequate response actions are being taken by the polluter or other responder, and whether the oil is deemed a substantial threat to the public health or welfare. The OSC's authority and substantial threat determination are further defined below. For USCG OSCs, if deemed to be the most practical or cost effective method for pollution removal activities, a vessel may be removed or destroyed when approved by the Commandant.[68] Similar to the differences under CERCLA, EPA OSCs do not have any special limitations on their ability to remove or destroy a vessel under Section 311(c) of the CWA as amended by OPA—in fact that authority may be directly delegated to the OSC.[69]

Stafford Act and Other Funding Authorities

Stafford Act Funding - In accordance with Recovery Policy 9523.5, Debris Removal from Waterways, published 30 October 2012, "FEMA may fund the removal and disposal of eligible debris, wreckage, and sunken vessels from non-federally maintained navigable waterways, the coastal or inland zones, or wetlands only when another federal agency does not have the specific authority to fund the activity."[70]

FEMA has determined the following vessel removal activities are ineligible under Stafford Act:

- The removal of wreckage and sunken vessels from federally maintained navigable channels and waterways; and
- The removal of debris from privately owned canals, waterways and banks.[71]

FEMA may issue a Mission Assignment under ESF-3 to USACE to conduct salvage and debris management activities under the Stafford Act. Stafford Act funding may also be provided to EPA and USCG through ESF-10 Mission Assignments to conduct oil and hazardous materials response related to abandoned vessels.

Congressional Supplemental Appropriations to the NOAA Marine Debris Program (MDP) and the NOAA Office of Coast Survey – Following extreme storm events, Congress has passed supplemental appropriations to NOAA to survey nearshore waters, map items found, disseminate survey information to assist with removal, and inform the public. This occurred after Hurricanes Katrina and Rita as well as after Hurricane Sandy, and is dependent upon congressional approval.

NMSA – As noted in Section 4, under the NMSA, funding may be made available for removal activities within sanctuaries for removal of derelict and abandoned vessels, depending on the fiscal health of the

[68] COMDTINST 16465.5, Vessel Removal and Destruction Under CWA and CERCLA
[69] EPA. (1993). *Delegations Manual 2-89, Removal of Discharge or Threat of Discharge*.
[70] 44 C.F.R. § 206.208(c)(2))
[71] There are limited exceptions to the above ineligibilities noted in *RP9523.5, Debris Removal from Waterways*, Section VII.B.6.

fund and whether there is significant injury to sanctuary resources. Similar funds may be available through DOI bureaus, including NPS and USFWS. These funds would be made available to the respective resource trustee and are not used by OSCs. Oil and hazardous substance removal would remain the responsibility of the OSC.

5.2 STATE FUNDING

There are a variety of state programs for abandoned and derelict vessels. *Appendix C: State Abandoned Vessel Programs* describes these state programs, provides citations, and indicates whether funding is available. Many states may have programs for the removal of abandoned vessels but lack adequate or continuing funding. In many cases, the vessel can be claimed by the state after a requisite period, removed, and the costs may be partially recouped by public auction. However, as noted earlier in this document, auctioned vessels in poor condition may be abandoned again later.

5.3 DETERMINATION OF FUNDING SOURCE(S) FOR SUBMERGED WRECKS

The figure on the following page outlines specific funding considerations for abandoned wrecks and mitigation of pollution from submerged wrecks. Decision points along the continuum will help OSCs determine the most appropriate funding source for the removal of abandoned vessels. The order of the questions is not intended to represent a preference in using one funding source over another. Further guidance on this subject can be found in Appendix D of this document.

Within USACE, federal removal of submerged wrecks and other obstructions within a federal channel (if determined to be a hazard to navigation and a responsible owner, operator, or lessee is not located) is funded under Maintenance and Operations of Dams. This is a category within the annual USACE Civil Works Appropriation, the "Energy and Water Development and Related Agencies Appropriations Act."

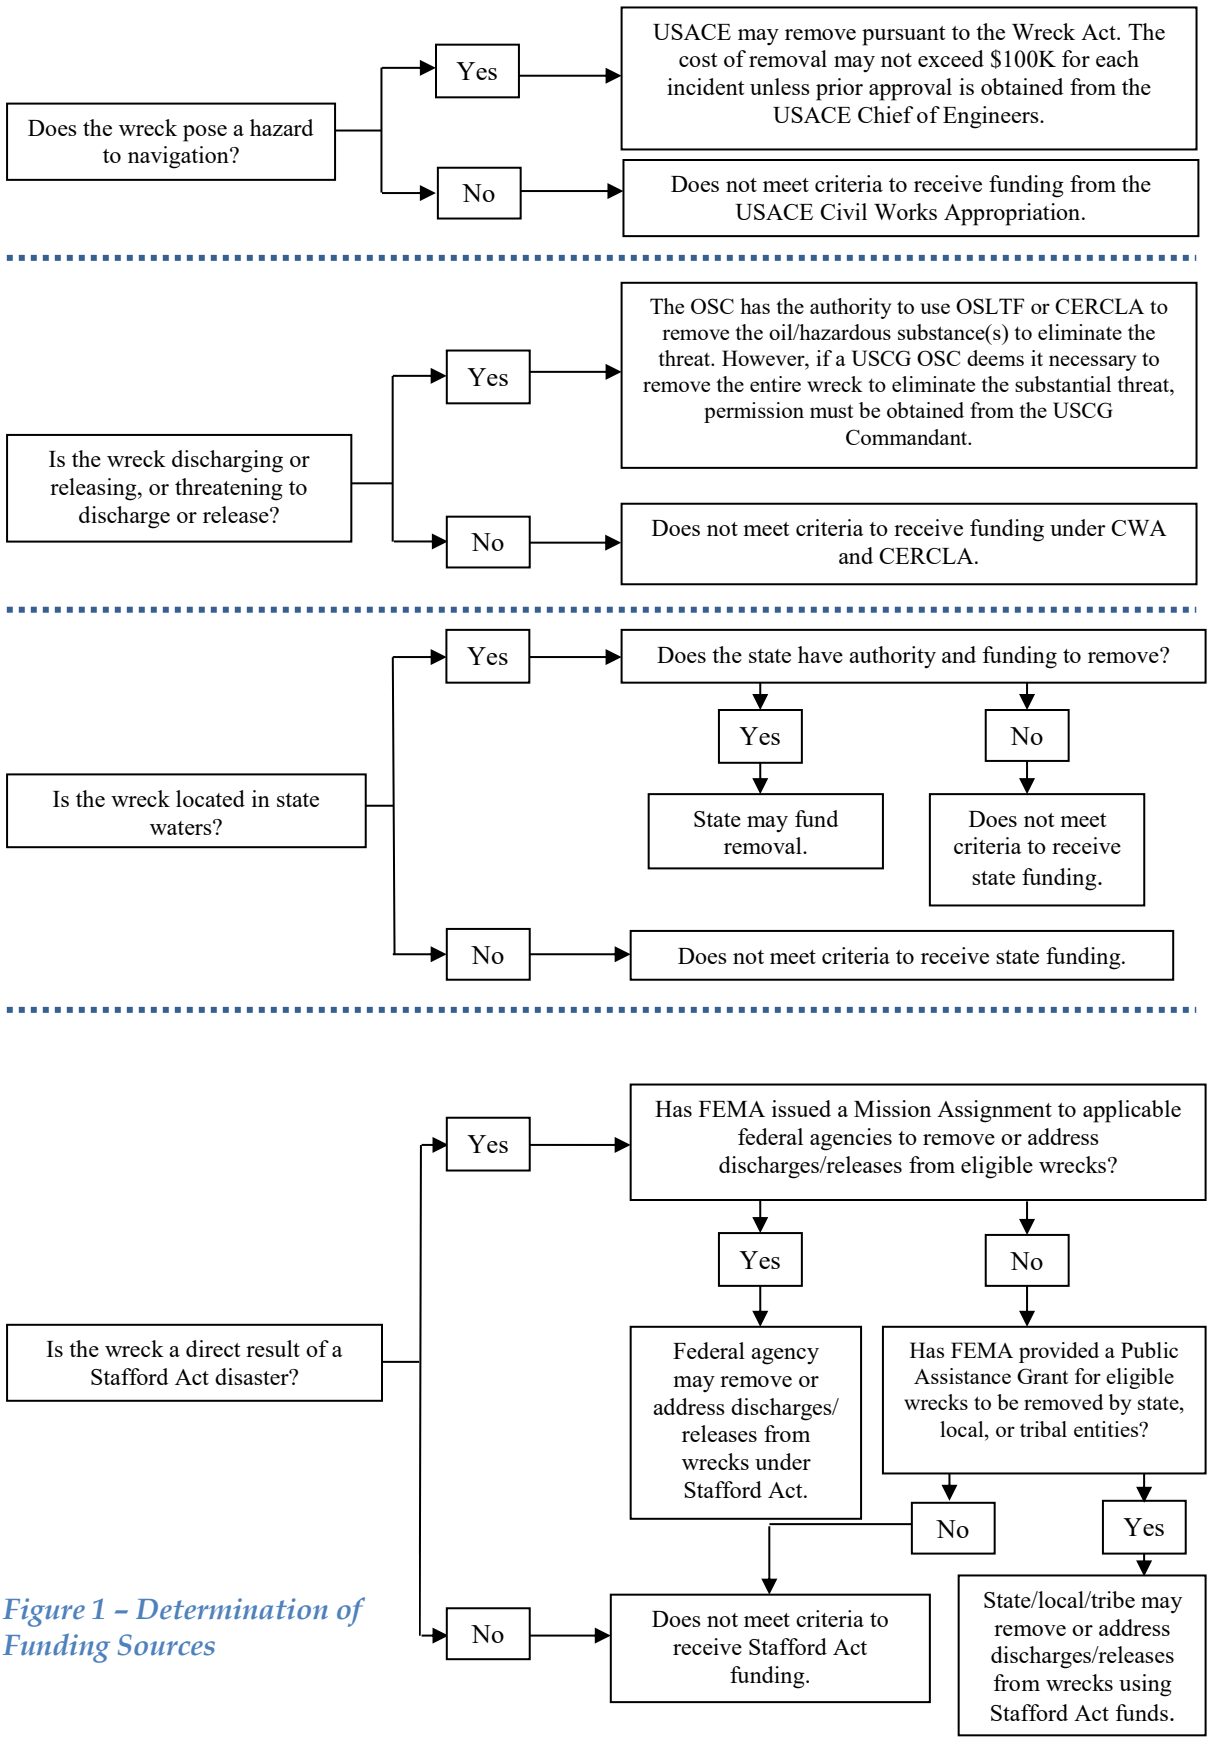

Figure 1 – Determination of Funding Sources

5.4 NAVY ASSETS AND SUPSALV STANDING CONTRACTS

SUPSALV maintains a small cadre of government employees who manage and provide technical assistance for salvage, deep search and recovery, towing, and oil spill response operations. These operations can be accomplished using civilian contractors, military assets, or a combination of both. All Navy assets, SUPSALV, and military can be accessed by EPA or USCG OSCs, when available, and at the approval of the Chief of Naval Operations (CNO) or appropriate Fleet Commander. In the case of USCG, this is done through an established Navy-USCG MOU, which is described in Appendix B. Military assets are under the operational control of Combatant Commanders and subject to military tasking but have often been made available to support USCG missions. All military assets (to include Military Sealift Command ships) are mission funded, which means that operation costs for the OSC acting under CWA 311(c) are limited to directly-related incidentals like travel and consumables. SUPSALV civilian personnel are likewise mission funded. SUPSALV contracts require funding to activate, but in cases where SUPSALV contractors operate government equipment in support of USCG missions, only direct mission costs are charged. All SUPSALV standing contracts are competitively bid. Several may be used in a single operation. The most pertinent SUPSALV contracts are:

- *Emergency Ship Salvage Material (ESSM)* – Maintains and operates a very large array of government-owned, contractor-operated (GOCO) oil spill response and salvage equipment from manned bases in Virginia, California, Alaska, and Hawaii to unmanned facilities in Italy, Bahrain, Singapore, and Japan.
- *Deep Search and Recovery* – Maintains and operates an array of GOCO remotely operated vehicles (ROVs).
- *East Coast Salvage Contract* – Contractor owned and operated (COCO) salvage and towing for the Atlantic and Mediterranean Oceans.
- *West Coast Salvage Contract* – COCO salvage and towing for the Eastern Pacific Ocean.
- *Western Pacific Salvage Contract* – COCO salvage and towing for the Western Pacific and Indian Oceans.

Section 6.0 Vessel Removal and Options for Ultimate Disposition

6.1 INTRODUCTION

The response to abandoned vessels for the purposes of removing pollution, potential threats to public health and the environment, and removing the remaining wreckage is predicated on the results of the initial assessment, determination of relevant response authorities, and applicable funding. At this point, the assessment results have been used to determine the appropriate authority and funding mechanisms. The assessment has prepared the OSC/COTP with a realistic picture of the breadth of activities required and potential stakeholders that may be involved in further decision making, e.g., those members that may make up the UC, if one is established.

The information below details tactics that were developed based on case studies of joint federal, state, and local actions to mitigate and remove abandoned vessels and cases where the use of CERCLA or OSLTF was used in conjunction with other agency or jurisdiction efforts. For USCG responders acting under CWA 311(c), removal or destruction of a vessel is a rare occurrence and must be done in accordance with USCG policy, which requires Commandant-level concurrence.

Finally, this Section contains guidance for operations where CERCLA or OSLTF may not be applicable. Processes for abandoned vessel evaluation, management and disposition are presented, although not all steps are applicable under all circumstances.

6.2 DISCHARGE/RELEASE OR SUBSTANTIAL THREAT OF DISCHARGE/RELEASE OF OIL AND/OR HAZARDOUS SUBSTANCES[72]

If not being immediately addressed, OSCs should incorporate known abandoned vessel and legacy wrecks of significance into their ACPs and regional Abandoned and Derelict Vessel Tracking Databases. This advanced planning will help OSCs prioritize, plan, and prepare for future response activities relating to abandoned vessels and legacy wrecks. To assist in this effort, NOAA has initiated a comprehensive catalog of legacy wrecks posing a significant threat to inland and coastal zones. This activity is described further in *Appendix D: Pollution Mitigation of Legacy Wrecks.*

When a determination is made that an NCP removal action is appropriate and vessel removal is likely, response should be conducted in a manner that will assist vessel removal operations.[73] Although state and local jurisdictions may have the authority to remove vessels regardless of whether they have pollution aboard, they may not have the funding or staff to accomplish the task. Use of NCP or other federal authorities in conjunction with state or local authorities often provides the best chance for a complete elimination of the offending vessel. Case studies of OSLTF- and CERCLA-funded responses consistently underscore this fact.

Abandoned vessels should be continuously monitored by agencies with jurisdiction because waste and other materials may be illegally discarded at these sites. Many abandoned vessels are used repeatedly as receptacles for oil and hazardous substances. Abatement activities should be carefully documented to help demonstrate a pattern of repeated mitigation efforts. Consistent documentation will help articulate the need for expedited removal.

[72] Discharge includes substantial threat of discharge, and release includes substantial threat of release in accordance with the NCP, 40 C.F.R. § 300.5, Definitions.

[73] To keep their historic integrity intact after oil removal, legacy wrecks should not be moved or removed. Most of the wrecks will be in such depths that they are not threats to navigation.

If an OSC exercises authority under CERCLA or the CWA to remove and destroy a vessel, the NCP provides the protocol for safely managing and disposing offsite any hazardous substances or oil that may be encountered during the removal action, consistent with any applicable laws.

6.3 NO DISCHARGE/RELEASE OR THREAT OF DISCHARGE/RELEASE OF OIL AND/OR HAZARDOUS SUBSTANCES

If a determination is made that a removal action, whether coastal or inland, is not appropriate, OSLTF/CERCLA funding will not be available and the authorities to respond will be far more limited. In particular, the USCG may still have a few tools and can work the safety and navigational hazard issues involved. The following are other options:

- As noted in Section 4.0 of this document, USACE has the authority to remove certain obstructions to navigation, including submerged vessels. Depending on the cost of the removal, such an operation may be approved at the District Engineer level. Certain criteria will have to be met before USACE will undertake such an operation. Responders seeking their involvement should consult with them early to ascertain whether they can assist. Aside from contacting the local USACE District, guidance can be found in 33 C.F.R. Part 245 and the "[MOU] between [USACE] and [USCG] Regarding the Mitigation of Obstructions to Navigation (2012)."
- Federal land owners may have authorities. Other government agencies (e.g., NOAA NMS, NPS, USFWS refuges, DOD) may have authorities that they can enact when abandoned vessels are on their land or threaten lands under their care. This has been accomplished on several occasions within the Florida Keys, Channel Islands, Monterey Bay and Gulf of the Farallones National Marine Sanctuaries.
- State and local means of removal remain options. State and local methods that have been successful include utilizing state law that authorizes the removal of abandoned vessels, or even seeking a court order locally. As with the USACE process above, these methods are available regardless of whether oil or hazardous material (hazmat) is aboard. Please see *Appendix C: State Abandoned Vessel Programs* for a list of applicable state statutes.

6.4 POST-DISASTER RESPONSE OPERATIONS

During post-disaster response operations such as after a hurricane, severe storm, or tsunami, vessels often have a registered owner or operator, unlike traditional abandoned vessel cases where there is usually no known RP. Authorities managing vessel recovery operations should not delay in identifying the vessel owner, operator, or lessee. If a vessel is found in a precarious location, likely to refloat and become a hazard to navigation, it is advisable that the vessel be promptly removed and relocated to a temporary staging area. Additionally, in the event the owner, operator, or lessee is located, it is good practice to ensure that a definitive date of removal is established (usually associated with a legal determination that the vessel is abandoned). If the owner is not able to remove the vessel, or unable to do so in a timely manner, the OSC/COTP should document the date and the vessel identification (ID), location, brief description, condition, and disposition prior to removing and relocating the vessel, if required.

Unless emergency conditions exist, a vessel should not be removed without prior arrangement for disposal, dry storage, or temporary moorage. State governments can request federal support for staging/storage areas from FEMA for Mission Assignments to appropriate ESFs under the NRF (e.g., ESF-3 or ESF-10, depending on the situation). Both EPA and USCG OSCs are encouraged to engage with local and state government officials to arrange for staging areas in support of significant natural disasters, when appropriate.

The following figure briefly depicts the process of post-disaster salvage and debris recovery operations.

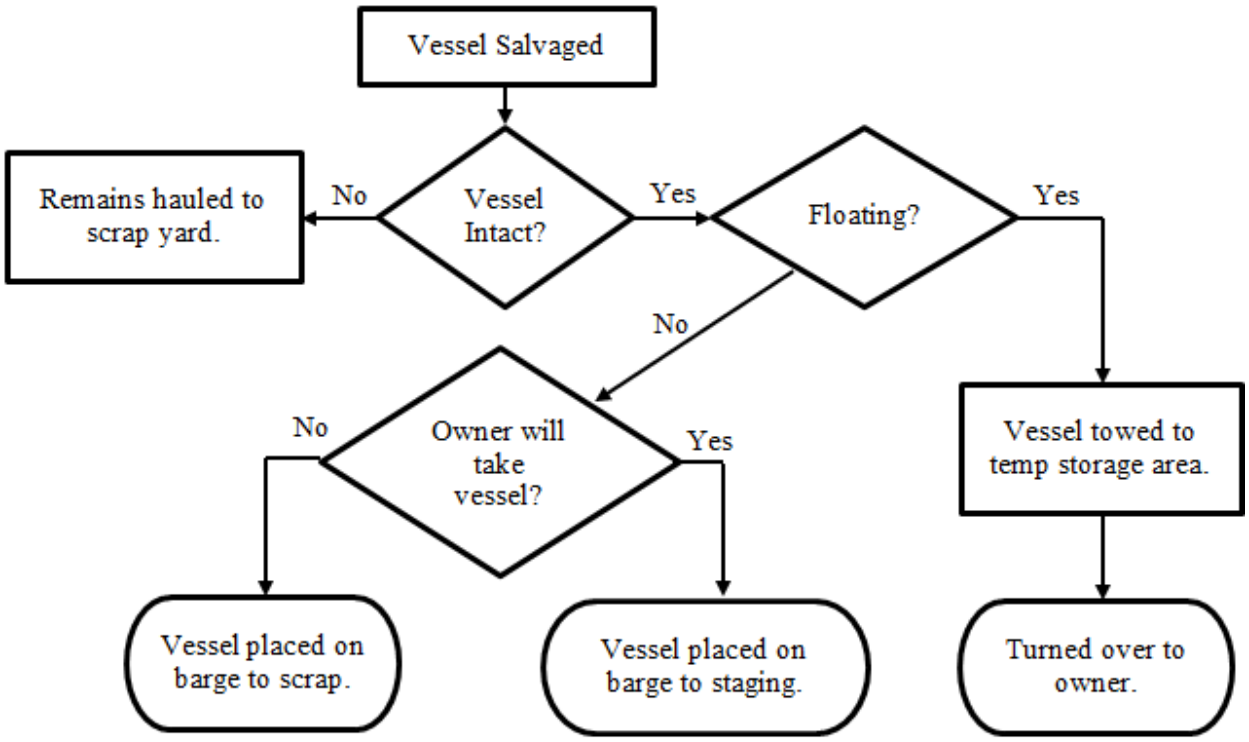

Figure 2 – Post-Disaster Salvage Vessel Disposition Process

Movement and/or potential disposal of displaced vessels is only authorized under an established Mission Assignment requesting federal support in this capacity. In cases where ESF-3 is not authorized for removal activities, other federal options may include USACE authorities, as noted above, or ESF-10, if a Mission Assignment exists for oil and hazardous substances. The coordination of vessel end-state becomes increasingly important in this case so as to preclude vessels becoming abandoned in the marine environment.

The following general flowchart supports OSC decision making with regard to vessel removal operations under FEMA Mission Assignments in post-disaster response operations in the event removal operations are authorized through an ESF-3 Mission Assignment.[74]

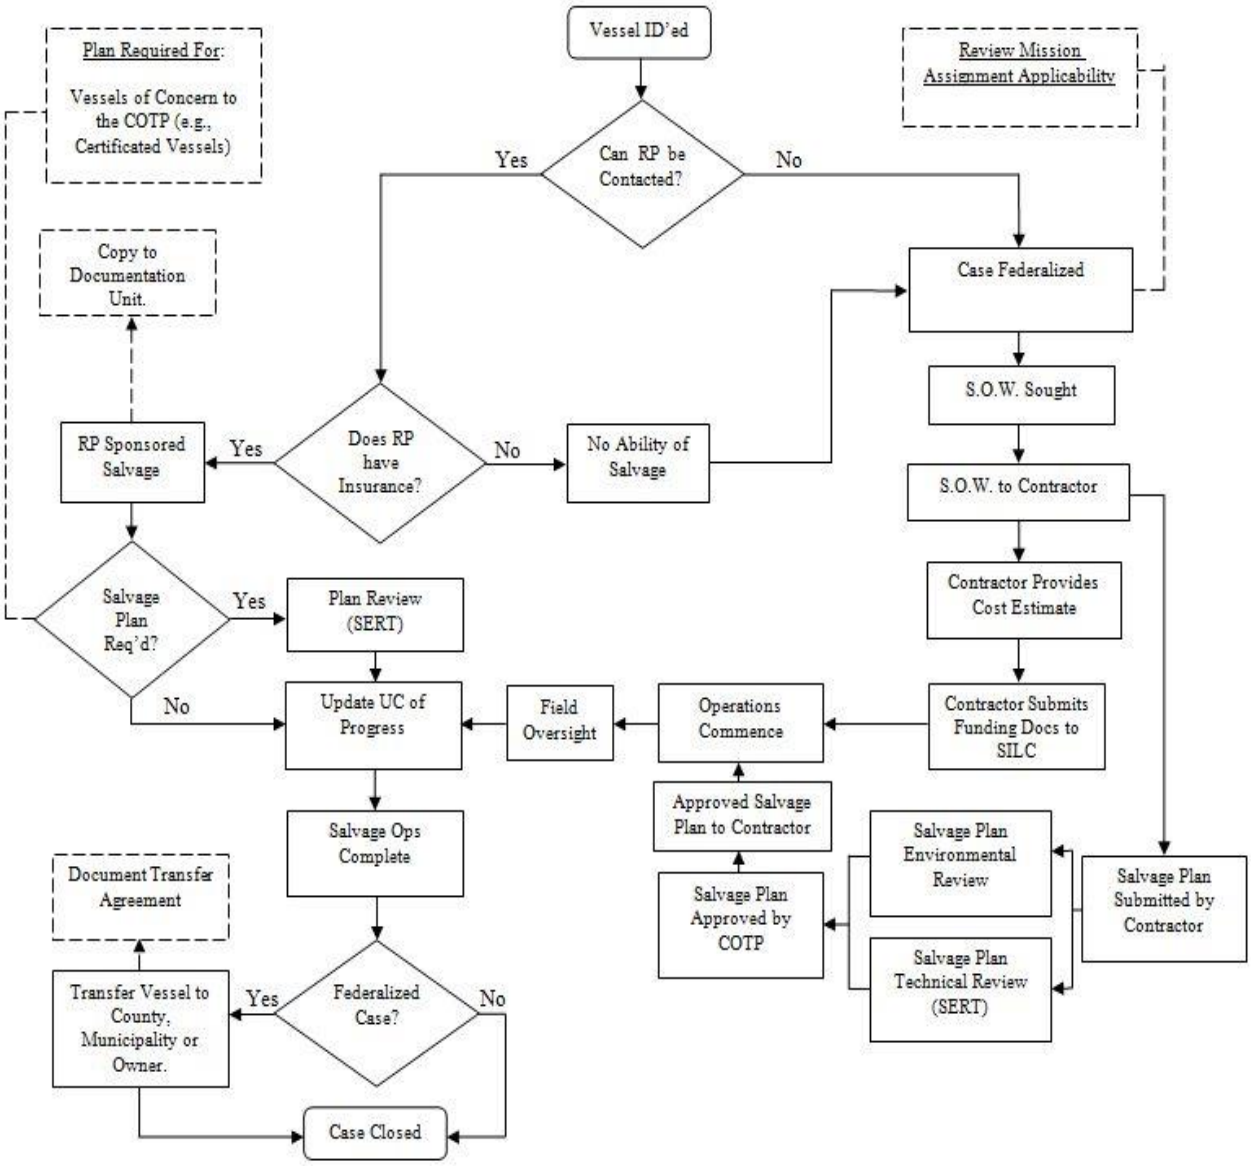

Figure 3 – Post-Disaster Vessel Removal Operations[75]

6.5 GENERAL PROCESS FOR ABANDONED VESSELS MANAGEMENT

Based on a combination of federal and state requirements (as well as USCG Commandant Policy, for USCG OSCs), the following are benchmark activities that should be conducted when pursuing removal

[74] In very rare circumstances, the Treasury forfeiture fund might be available to fund destruction of vessels engaged in criminal enterprises.
[75] OCMI (Officer in Charge, Marine Inspection); DOJ (U.S. Department of Justice); SERT (Salvage Emergency Response Team); SOW (Statement of Work); SILC (Shoreside Infrastructure Logistics Command)

and disposition of abandoned vessels. Several management options may be available for abandoned vessels, including vessel turn-in programs, donation of vessels, recycling, dismantling, artificial reefing, and ocean disposal.

General Progression for Abandoned Vessel Management

1. **Identify vessel owner or establish abandonment.**
   Can the owner be identified through state registration, insurance, or other means to determine title?
2. **Notify vessel owner in writing of intent to remove/destroy.**
   Once a vessel is determined to be abandoned, a best effort should be made to notify the last known owner of the intent to remove the vessel, and the possible disposition of the vessel post-removal.
3. **Provide public notification if owner cannot be contacted/identified.**
   If the owner cannot be identified, the proposed vessel removal and disposition should be advertised.
4. **Determine state jurisdiction/state programs available for removal.**
   Some state programs are funded and can assist with the removal of abandoned vessels, providing removal funding where federal funds may not be viable.
5. **Obtain State Historic Preservation Officer approval if vessel is over 50 years old and has potential "historical significance."**
   Once removal authority has been determined, reference should be made to the NHPA. Contact the SHPO to implement Sec. 106 consultation under the NHPA and to determine whether any restrictions exist regarding removal.
6. **Initiate other federal consultations/approvals under ESA, EFH, MMPA, NMSA, NHPA, Section 404 of the CWA, Section 10 of the RHA, Section 103 of the MPRSA, and the Park System Resource Protection Act[76] as necessary.**
7. **Determine appropriate federal and/or state response authority and funding source, as discussed in earlier sections.**
   Determine whether a discharge or release, or substantial threat of discharge or release exists, in accordance with the NCP. The ability to obtain OSLTF or CERCLA funding is directly contingent on the previous items respectively. NPFC should be consulted and engaged in the removal process where OSLTF funds will be used to fund the response. Consider actions under USACE authority to remove obstructions to navigable waters under the Wreck Act.
8. **Obtain Statement of No Objection (SNO) from flag state if foreign flagged.**
   If the vessel is foreign flagged and in U.S. territorial waters, a SNO should be obtained from the flag state prior to commencing removal.
9. **Identify management options.** Includes options for ultimate disposition of vessels. Includes options discussed in Section 6.6.
10. **Complete a Vessel Removal/Destruction Request Memorandum package (USCG Only).**[77]
    This package must be completed by USCG OSCs pursuing the removal and destruction of any vessel (except under the post-disaster conditions discussed in section 6.4).

[76] 16 U.S.C. § 19jj
[77] The requirement for USCG Commandant approval is an internal USCG requirement under *COMDTINST 16465.5, Vessel Removal and Destruction Under CWA and CERCLA*.

6.6 OPTIONS FOR ULTIMATE DISPOSITION OF ABANDONED VESSELS

Once the authority for the federal OSC/COTP to assume custody of the vessel has been established, disposition options for managing these vessels include dismantling for recycling or scrapping (as well as land disposal), creating artificial reefs, vessel turn-in programs, donation of vessels, and disposal at sea. Each disposition management option is unique to the abandoned vessel, the locality in which the vessel is grounded or moored, the construction and size of the vessel, and the physical state of the vessel. There are statutory requirements and associated regulations, as well as permit processes applicable to the disposition management options mentioned above. These requirements and regulations, as well as the amount and types of materials of environmental concern that may be present on an abandoned vessel, the amount of economically salvageable parts of the vessel, and the condition of the vessel should be considered before choosing a disposition management option for an abandoned vessel. Descriptions of the following options are provided below:

- Vessel Turn-In Programs
- Donation of Vessels
- Dismantling for recycling or scrapping (as well as land disposal)
- Artificial Reefing
- Ocean Disposal

When selecting the appropriate disposition management option for an abandoned vessel, the OSC/COTP should consider the efficiency, expedience, and stewardship of the method proposed. Is time of the essence? If not, more time may be available to seek alternative methods of mitigation that provide the greatest benefit to public health and the environment. Vessel disposition management options that provide the least impact on public health and the environment from operations are preferred—assuming they are good options when considering the following factors as well. Is the proposed method expedient or will the operation be labor intensive and slow due to limited logistics availability and infrastructure support? The OSC using federal funding (either CERCLA and/or OSLTF) should also determine whether the abandoned vessel disposition management action demonstrates best use of the funding source. Although this is not the sole determining factor, it is one that should be taken into account when reviewing options in their totality. Other factors include, when appropriate:

- Threat of pollution
- Hazard to navigation/potential hazard to navigation
- Impact to the environment and human health
- Proximity to environmentally sensitive areas
- Cost of management option
- Availability of needed resources or facilities (programs, dismantling yards, etc.)

Finally, state programs may be able to assist in the removal of a vessel as discussed earlier, sometimes making it far easier to respond to abandoned vessels.[78]

Vessel Turn-In Programs

Some states such as the State of California have programs that allow an owner to turn over custody of a vessel in lieu of abandonment. Disposal options vary, but may include scrapping and recycling. This action alleviates the penalty that may otherwise be incurred by abandonment. Programs such as these are

[78] For example, the State of California Division of Boating and Waterways offers a robust program for the mitigation of abandoned vessels, including the Abandoned Watercraft Abatement Fund and the Vessel Turn-In Program. Washington State recently passed legislation authorizing a similar program.

appropriate for small recreational vessels and are not intended for larger commercial vessels. Further, not all states have a vessel turn-in program.

Donation of Vessels

For vessels in acceptable condition and still retaining their seaworthiness, donation to charity may be an option for the vessel.

Dismantling for Recycling or Scrapping

According to the Occupational Safety and Health Administration (OSHA), ship dismantling or ship breaking is defined as "any breaking of a vessel's structure for the purpose of scrapping the vessel, including the removal of gear, equipment, or any component of a vessel."[79] Both small recreational vessels as well as large commercial vessels may be candidates for dismantling for recycling or scrapping (both of which will likely include land disposal of remaining ship materials and waste). Dismantling a vessel will generally be done at a ship breaking facility for larger vessels or at an approved shore facility for smaller vessels. On rare occasions, a vessel's condition may require it to be dismantled in place in the waterway. There may also be occasions when after a vessel is dismantled, recycling or scrapping is not an option. In such instances, an option for small recreational vessels or portions of larger vessels might be disposal in appropriate disposal facilities capable of handling a given type of waste.

During the dismantling process, ships are taken apart and broken down into components and pieces of equipment that can be recycled/reused on other boats, or sold as scrap metal. Remaining pieces/materials of the ship are then disposed of at appropriate reception facilities. The sales of recycled and scrapped materials can help offset the cost of dismantling and disposal. Part of the dismantling process includes the proper disposal of waste from the vessel.

It is illegal for vessel owners to conduct ship breaking activities except in licensed areas. If a responder is developing a plan to dismantle an abandoned vessel in place or at a ship breaking facility for recycling or scrapping, then all appropriate federal, state, and local agencies should be consulted to ensure that all permitting requirements are met for the operation. Responders should consult with subject matter experts such as marine operators, salvage masters, and crane operators to determine the most safe and effective method for dismantling a vessel.

Ship breaking facilities have the equipment and expertise necessary to dispose of an abandoned vessel. However, responders should ensure that ship breaking facilities are reputable and in compliance with all federal and state regulations. Responders should ensure that measures are in place to mitigate potential pollution prior to commencing any operation.

Recycling

Recycling is the re-use of the vessel or parts of the vessel. Recycling is reserved for vessels that have some residual value as a result of their construction material or parts remaining on board. Salvors and vessel parts dealers may buy the vessel for the cost of dismantling the vessel minus the revenue generated from recycled parts.

Scrapping

The scrapping of abandoned vessels can be a source of steel. Depending on the current market value of ferrous metals, a great deal of cost can be recovered by the resale of steel from a larger recycled vessel. Further, both the copper and the machinery can be sold for a notable return.

[79] 29 C.F.R. § 1915.4

EPA developed a guide for ship scrappers that provides a process-by-process approach for the removal and disposal of asbestos, PCBs, oil and fuel, paint, miscellaneous ship machinery, as well as metal cutting and metal recycling. This guide is intended to provide the site supervisor of a ship scrapping facility with a good understanding of the most pertinent *federal* environmental and worker safety and health requirements affecting ship scrapping/ship breaking operations. The guide can be accessed at: http://www.epa.gov/compliance/resources/publications/civil/federal/shipscrapguide.pdf.[80]

Artificial Reefing

Sinking a vessel to serve as an artificial reef may be a management option for an abandoned vessel, if the vessel can be appropriately prepared and cleaned so that its use as an artificial reef will be environmentally sound. Artificial reefing can enhance the marine environment for fish habitat and/or recreational diving, if vessels are properly cleaned prior to sinking and the vessel is sunk at a location properly sited. EPA and MARAD jointly released national guidance in 2006 regarding the preparation of vessels intended to serve as artificial reefs.[81] This Guidance identifies materials or categories of materials of concern that may be found aboard vessels and specifically identifies where they may be found. For each material or category of material, this document provides a narrative cleanup performance goal and information on methods for achieving those goals in preparation of the vessel prior to sinking. Materials of concern include, but are not limited to: oil and fuel, asbestos, PCBs, paint, and solids/debris/floatables. If the narrative cleanup goals provided in the EPA/MARAD guidance cannot be economically achieved, for example, because of significant amounts of materials of concern present on the vessel, then the vessel would not be a good candidate for reefing. The preparation process for reefing of a vessel contains requirements and regulations that must be met, including permit processes, such as Section 10 of the RHA and/or Section 404 of the CWA, and appropriate disposal of waste generated during vessel cleanup.

Ocean Disposal

Under MPRSA Section 102, EPA issued a general permit for the transportation and ocean disposal of vessels. The general permit is published in EPA's ocean dumping regulations at 40 C.F.R. Part 229.3 (See Appendix F). Under the general permit, vessel sinking cannot occur unless EPA concurs that the proposed action complies with the conditions of the permit, including removal of all toxic or hazardous substances that may degrade the marine environment prior to disposal to the maximum extent practicable. The general permit includes notification, cleanup/vessel preparation, disposal and reporting requirements. The general permit requires demonstration of the need for the disposal of the vessel and documentation of an adequate evaluation of alternatives to ocean disposal (i.e., scrap, salvage, and reclamation). The general permit also includes provisions for emergency situations.

If ocean disposal of a vessel is a potential option, it is recommended that the EPA Ocean Dumping Program in the appropriate EPA Region be contacted as soon as possible. In addition, depending on the scope of work, authorization may be required under Section 103 of the MPRSA.

6.7 COST RECOVERY AND DOCUMENTATION

Cost documentation for abatement of pollution threats from abandoned vessels using OSTLF and CERCLA is conducted using standard agency policies, Technical Operating Procedures, and for USCG OSCs, associated USCG Commandant's policy. For abandoned vessel activities associated with Stafford Act funding, OSCs will generally conduct cost documentation and recovery activities in the same manner as established in the NCP.

Appendix A: Abandoned Vessel Response Case Studies

Case Study	Description and Final Vessel Disposition
1. Barge DAVY CROCKETT	Highlights pollution abatement and dismantling in place for land disposal/scrapping of abandoned barge.
2. M/V SEA WITCH	Cooperative multi-contractor effort managed by federal OSC for the abatement of significant pollution from abandoned vessels.
3. M/V JIREH	Underscores the use of OSLTF to mitigate the substantial threat of a discharge and potential impacts to protected ecosystems and threatened/endangered species.
4. M/V SEA BREEZE	Demonstrates cooperative state and federal efforts to remove abandoned vessels from near shore environments.
5. Hurricane Ike	Demonstrates involvement of SUPSALV in debris recovery in post-disaster operations.
6. Petaluma Precedent Site	Emphasizes EPA's application of CERCLA for removal of abandoned vessels and wrecks from the inland zone.
7. Sacramento Lighter Aboard Ships (LASH) Barges	Underscores cooperative operations toward the abatement of significant pollution threats from derelict vessels.

Table 2 – List of Abandoned Vessel Case Studies

Barge DAVY CROCKETT, Portland, Oregon

Vessel Description: 432-foot converted Liberty Ship built in 1942 located on the northern bank of the Columbia River near Camas, Washington.

Incident: During the timeframe between December 2010 and January 2011, illegal scrapping operations caused the number 3 hold on the DAVY CROCKETT to buckle, resulting in a sheen emanating down river. Additional high tides further degraded the structural integrity of the barge and weakened the keel, resulting in further oil discharges. On 27 January 2011, USCG Sector Columbia River federalized the response and established a UC with both Oregon and Washington State OSCs. Due to the lack of structural integrity of the barge coupled with the unknown holds containing oil and contaminants, a destruction memo was drafted and approved by USCG Commandant for removal of the barge.

Removal Actions Included:

- Dive operations for pollution and structural integrity assessments
- USCG SERT assistance to ballast and stabilize barge
- Implementation of safety zone
- Implementation of Geographic Response Plans (GRP)
- The construction of an 850-foot metal cofferdam lined with impermeable oil and silt barriers along with sorbent oil collection boom, preventing oil sheen from discharging
- Diving teams and salvage crews to dismantle barge
- Cranes, barges, filtration systems, and other heavy equipment to remove sections of the barge, conduct dredging operations, and treat the contaminated water

Total Products Recovered:

- 1.6 million gallons of oily water
- 4.5 million pounds of steel, 7,500 pounds of scrap metal
- 842,000 pounds of oily debris
- 4,850 pounds of asbestos

Cost: $23.3 million

Funding Mechanism for Removal: CERCLA and OSLTF

Final Vessel Disposition: Dismantled in place for disposal on land/scrapping.

Significant Challenges and Solutions:

- Illicit scrapping of structure resulted in bow sunk and stern afloat creating significantly unstable structure.
    - UC brought in USCG SERT for consultation of plan to sink stern and cut from bow to stabilize the structure.
- Initial plan was to refloat stern and bow and move to a shipyard for disposal. Due to current Superfund site issues for facilities along the Willamette River, shipyards wanted indemnification for disposal and contractor liability.
    - The UC was not able to legally provide indemnification and this became a roadblock for the initial plan. The UC then had to change strategy to remove the barge by

building a steel pile cofferdam and impermeable barrier around the barge and dismantling it in the river system.

- River current and high river levels resulted in water running over the cofferdam, which made operations challenging.
    - A break wall was constructed to reduce current and stress on structure.
    - Impermeable barrier helped limit water entering cofferdam when river level rose over the cofferdam sheet pile.
- Major safety concerns with unstable structure, dermal, and inhalation risks (asbestos, oil, lead, and PCBs), movement of heavy equipment and steel sections, dive operations, slips/trips/falls, and decontamination operations.
    - Employed contractor and USCG National Strike Team Safety Officers to develop, implement, and monitor comprehensive Site Safety Plan.
- Implementation of additional GRPs for protection of natural and cultural resources.
    - Conducted consultation with Advisory Council on Historic Preservation (ACHP) and SHPO and reached out to tribal representatives to protect cultural resource interests.
    - Developed additional on-water protection strategies and monitored for effectiveness.

M/V SEA WITCH, Baltimore, Maryland

Vessel Description: 700-foot container ship constructed at the Bath Iron Works in Maine.

Incident: In August 2003, the Maryland Port Administration requested assistance from the Maryland Department of the Environment (MDE) to mitigate an ongoing oil release from a shell of a container ship. Kurt Iron and Metal, a salvage yard in the Fairfield section of Baltimore City, was charged with scrapping the USS CORAL SEA, a World War II era aircraft carrier. Scrapping the carrier required the removal and proper disposal and treatment of oil and oil sludge. Kurt Iron and Metal reportedly acquired the bow half of the SEA WITCH to use as a vehicle to separate the oil on the CORAL SEA from the water. However, despite this history, there was no clear record of the ownership of the M/V SEA WITCH that could be established.

During the 2003 Tropical Storm Isabel, the M/V SEA WITCH took on water and sank in the Patapsco River, where it discharged an unknown quantity of oil. USCG and MDE took responsibility and created a UC to jointly make decisions on the best options to clean up and mitigate pollution from the M/V SEA WITCH. USCG agreed to use funds from the NPFC for the cleanup. A contractor was hired and the ship was cleaned. Once divers from the U.S. Navy SUPSALV declared that the bottom of the ship was clean, the USCG recommended that the vessel be kept in place.

Removal Actions Included: Employment of pollution removal and salvage elements (commercial oil spill removal organization (OSROs) and marine salvage), as well as SUPSALV. Operations included an initial assessment and removal of pollutants followed by re-mobilization, refloating, and removal of fuels from bottom tanks.

Total Products Recovered:

- No. 6 oil and oil-contaminated water: 478,787 gallons
- Oily mud: 50,969 gallons
- Oily sludge and debris: 161 tons
- Scrap metal: 44,700 pounds

Cost: $16 million

Funding Mechanism for Removal: OSLTF

***Final Vessel Disposition*:** Dismantled in place and recycled.

Significant Challenges and Solutions: In 2008, after initial activities had been completed, an investigation revealed a double bottom, between which oil had begun leaking. It was unknown how much potential oil was present and recoverable. To further complicate matters, the M/V SEA WITCH was resting in the middle of the future Masonville Dredge Containment facility. Again, USCG agreed to pay for the cleanup through the NPFC. After much patching and welding, M/V SEA WITCH was refloated in September 2008. Once the ship was refloated, oil, oily water, and oily sludge removal began. Once the cleanup was 90 percent complete, the vessel was towed to Sparrows Point graving dock where the vessel was cut up and recycled. This project is a remarkable example of a successful federal and state cooperation to contain a large oil spill and prevent further pollution to Maryland's waterways and wildlife.

M/V JIREH, Mona Island Wildlife Preserve, Puerto Rico

Vessel Description: 202-foot Honduran flagged freight ship, 979 gross tons, built in 1963.

Incident: On 21 June 2012, the M/V JIREH ran hard aground on the southwest side of Mona Island, located 40 miles west of the Commonwealth of Puerto Rico. At the time of the grounding, there were six crewmembers and 78 passengers aboard. The vessel was carrying legitimate cargo reportedly bound for St. Maarten, as well as contraband hidden aboard the vessel. In the absence of an RP, the OSC accessed the OSLTF to mitigate potential pollution impacts to the wildlife reserve. The vessel was deemed a substantial threat to the environment due to quantities of oil and hazardous substances on board as well as its quickly deteriorating condition.

Removal Actions Included: The removal of petroleum products, as well as all contaminated cargo and debris in the vessel's main hold. Additionally, substantial damage to the vessel's hull required repair. In this case, the vessel was to be scuttled at sea. However, structural stability of the vessel after several storms did not allow this action. Consequently, the vessel was dismantled in place and transported by barge to neighboring Puerto Rico for disposal on land.

Total Products Recovered:

- No. 6 oil and oil-water: estimated 3,000 gallons No. 6 oil and 5,000 gallons of oil-water
- Contaminated/wasted cargo: 60+ tons
- Scrap metal: 22.3 tons

Cost: $13 million

Funding Mechanism for Removal: CERCLA and OSLTF

Final Vessel Disposition: Dismantled in place for disposal on land.

Significant Challenges and Solutions:

Sensitive Area surrounding Mona Island – Mona Island Wildlife Reserve is one of the more sensitive areas in the region with regards to the number of threatened and endangered species present. There was some variance in opinion over what constitutes a substantial threat of discharge with regards to abandoned vessels. The NOAA SSC was consulted to help inform the determination of substantial threat in accordance with the NCP. Immediate impacts by oil and other hazardous substances to species were determined to pose an unacceptable risk.

Hurricane Season and Procedural Delays – Significant weather patterns in the Caribbean during late summer present a significant threat of tropical disturbances and hurricanes. Numerous weather delays hindered operations, causing shutdowns on several occasions and driving up the final removal cost. Contingency plans were developed to run ground tackle from the stricken vessel, thereby preventing it from running further ashore. In areas that face significant weather patterns, planning in support of pollution removal and vessel disposal activities should be done expeditiously with consideration of continued vessel deterioration.

Remote Location – Operations in remote locations are more complex. The movement and staging of equipment, as well as the sourcing of specialty equipment and disposal of wastes and recyclable materials, was found to be more difficult due to the remote location of Mona Island, 40 miles west of Puerto Rico. In these cases, it is vitally important that preplanning consider all possible contingencies, such that requisite resources are available in advance of their need.

M/V SEA BREEZE, Spruce Head, Maine

Vessel Description: 35-foot lobster boat.

Incident: The M/V SEA BREEZE, a wooden vessel, sank in a mooring field off Spruce Head, Maine in December 2011. Maine Marine Patrol (MMP) had been working with the owner (to no avail) for some time on repairing or removing the vessel. The vessel sank with an unknown quantity of diesel (estimated 50 gallons), other engine oils, batteries, and other packaged hazmat aboard.

Removal Actions Included: USCG and Maine Department of Environmental Protection (DEP) discussed response options, and determined that removal of the vessel was the best option. USCG explained that although it could arrange for the vessel to be raised and the pollution removed, it could not remove or destroy the vessel. The state did have a statute in place that allowed for the removal of abandoned vessels after due process requirements were met (see Title 12 Maine Revised Statute Annotated (MRSA) § 1866), but could not cover the entire cost of the cleanup.

Funding Mechanism for Removal: A plan was developed to use OSLTF/CERCLA funds to raise and clean the vessel, and utilize Title 12 MRSA § 1866 to remove the vessel. The actual salvage of the vessel to remove oil and hazmat had to be scheduled in conjunction with due process notice requirements under the state law allowing for removal, but the process was expedited under an emergency exception in the state law. Essentially, responders had to wait until the statutory amount of time under the state law had passed, otherwise the state would not have been able to complete the removal of the vessel after USCG raised and cleaned the boat.

Final Vessel Disposition: Dismantled in place for disposal on land.

Significant Challenges and Solutions: At the time of the sinking, the owner had no address and was not answering his cell phone. The USCG Sector responded in conjunction with Maine DEP, which placed boom around the vessel to contain sheening. USCG utilized MMP officers to attempt to contact the owner and deliver case paperwork, including a Notice of Federal Interest. The owner was never heard from.

On the day of the response, divers noted the vessel was coming apart underwater, so it ultimately was raised in pieces. Fuel tanks were pumped dry and batteries were located and removed. The vessel was brought by barge to a nearby concrete pier approximately 100 yards away from the mooring field station where the state then removed the pieces under its authority.

Notes:

- Before engaging in this type of joint operation, OSCs need to ensure the NPFC has approved the operations. Moving a vessel after it has been cleaned so that others can remove it may run afoul of the OSLTF or CERCLA. In the case of a beached vessel or one floating at a pier, this often means the use of OSLTF/CERCLA will be of no benefit towards the ultimate removal of the vessel, since pollution removal can be accomplished in those cases without moving the vessel. In this case, a decision was made that some of the cleaning would be most safely accomplished at the pier, so movement was not considered a real issue. If a longer move is necessary, USCG and the state could arrange for the cleanup contractor to charge the entity covering the removal for the transit if costs were involved. Confirmation in writing that the state, local, or other entity intends to remove the vessel once the OSC has raised and cleaned it will help obtain that approval.
- OSCs should confer with other jurisdictions that could be affected even if they are not participating in the actual response. In the case of the M/V SEA BREEZE, the local Selectman was upset that equipment (large trucks, front-end loaders, etc.) had been brought into town by the state, apparently in excess of the weight limit on the local bridge. The Selectman then sought to fine the responders hired by the state. The situation was resolved amicably, but had responders briefed the Selectman on the plan in advance, the issue could have been avoided.

Hurricane Ike Response, Houston/Galveston, Texas

Incident: Hurricane Ike response. SUPSALV provided a representative as requested by the COTP in Houston to augment USCG in responding to environmental and/or vessel salvage incidents as a result of Hurricane Ike. Primary focus quickly shifted to supporting USACE in clearing the Intracoastal Waterway between Freeport and Galveston, Texas. SUPSALV contractors deployed to remove vessels and debris that had sunk in this 65-mile stretch of the waterway to allow resumption of tug and barge traffic. Closure of the waterway had potential impacts to national refining capabilities and significant negative impacts to the local economy. The salvage team quickly and efficiently removed numerous vessels (primarily fishing boats) and accumulated household debris that had been swept into the waterway over a six-week timeframe to reopen the waterway.

Funding Mechanism: Stafford Act Funding, ESF-3

Final Vessel Disposition: Removed and disposed of via various methods.

Significant Challenges and Solutions: Logistics of mobilizing and contracting for salvage assets and teams to remote locations along the Intracoastal Waterway to accomplish timely removal of vessels and debris was challenging. Communications with customer and command element was difficult due to operations in remote locations.

In order to maximize on-site time, federal and commercial resources contracted for a berthing barge and support craft to allow the salvage team to stay on site as they moved farther down the waterway. Communications eventually improved as infrastructure came on line. Reliance on the onsite integrated team consisting of highly trained contractor Salvage Masters (commercial salvage) and SUPSALV representative to conduct independent real time clearance operations allowed for condensing the timeline and faster resumption of commercial traffic. Standing SUPSALV contracts allowed for rapid response and flexibility to contract for salvage assets as the situation evolved and needs became identified.

Outcome: 65 miles of the Galveston Intracoastal Waterway were cleared of debris allowing for the resumption of commercial shipping in an expeditious manner. USCG, USACE, COTP Houston, and commercial shippers were highly satisfied with the results of the operations performed.

Notable Lessons for OSC: The use of Basic Ordering Agreements (BOAs) greatly improved the Incident Command's ability to mobilize and hire local contractors to respond rapidly to natural disasters in a timely and efficient manner. Use of existing MOU with SUPSALV provided the OSC with increased flexibility and the ability to augment his/her salvage expertise for timely response to natural or manmade disasters.

Petaluma Precedent Site, Petaluma River, California

Vessel Description: 11 vessels, six river debris sites, three vehicles, and three barges.

Incident: In 2011, CalRecycle approached EPA Region 9 regarding the evaluation, assessment, and removal of numerous abandoned vessels and wrecks throughout the Petaluma River. Initial assessments of the inland river sites identified elevated levels of PCBs, arsenic, nickel, lead, asbestos, and substances exhibiting RCRA characteristics of hazardous waste, e.g., ignitability.

Removal Actions Included: Working with CalRecycle, EPA removed all hazardous substances and abandoned vessels and debris; transported and disposed of all hazardous wastes at approved facilities; conducted confirmation sampling; and conducted underwater surveys of all submerged obstructions and potential abandoned wrecks in Petaluma River. [82]

Total Products Recovered:

- 445 cubic yards of non-friable asbestos
- 18 cubic yards of hazardous waste solid
- 1,090 pounds of miscellaneous hazardous waste
- 72 lead acid batteries

Cost and Funding Mechanism for Removal:

- CERCLA/Hazardous substances - $651,586
- CalRecycle: Solid waste - $495,000
- Sonoma County Sheriff's Marine Unit: Adjudicated Vessels Abandoned

Final Vessel Disposition: Hazardous substances and contaminated debris disposed of via approved facilities. Vessels and marine debris associated with the case were scrapped and disposed of via landfill.

Significant Challenges and Solutions:

EPA's decision to engage in evaluation and removal actions was based on several factors, including:

- Actual or potential exposure to nearby human populations, animals, and/or ecosystems from hazardous substances or pollutants;
- Actual or potential contamination of drinking water supplies or sensitive ecosystems;
- Hazardous substances or pollutants in drums, barrels, tanks, or other bulk storage containers that posed a threat of release;
- Weather conditions that may cause hazardous substances to migrate or be released; and
- Threat of fire or explosion.

[82] EPA Memorandum. (2011). *Request for a Time-Critical Removal Action at the Petaluma Precedent Site, Petaluma, Sonoma County, California*.

Sacramento LASH Barges, West Sacramento, California

Vessel Description: Initial evaluations by USCG, EPA, state agencies, and the Port of Sacramento identified 22 former military Lighter Aboard Ships (LASH), and four derelict vessels. Two LASH barges and one drydock became the subject of this response.

Incident: On August 8, 2013, Sector San Francisco conducted a joint site assessment with EPA, state agencies, and the local port of a group of 22 LASH Lighters, including a dry dock located on Lake Washington, a tributary of the Sacramento River within the Sector San Francisco COTP Zone. These barges had been used as dumping grounds for many years, accumulating large quantities of petroleum, mixed hazardous materials including low-level radiation, and additional unknown hazards. The barges were in various states of disrepair and due to significant structural modifications, had questionable stability and buoyancy. This factor, coupled with the significant amount of hazardous wastes on-board, led the city, state and federal agencies involved to initiate emergency response actions. Because the potential responsible parties would not take action, the barges were acquired by the City of West Sacramento through legal injunction, and federal and state funding was accessed for the abatement of the pollution threats and disposition of non-contaminated debris.

Removal Actions Included: The USCG, teaming with BOA contractors, National Strike Force, California Department of Resource Recycling and Recovery, Department of Toxic Substance and Disease Control, and EPA, successfully removed all hazardous substances, miscellaneous oils and debris; conducted material sampling and hazard categorization; and transported and disposed of all hazardous wastes at approved facilities. Once the operations were completed, the remaining uncontaminated debris and vessel hulls were transferred to the State of California Department of Resource Recycling and Recovery for final disposal.

Total Products Recovered:

- 4,502 gals of oil/oil-water
- 252.5 gals miscellaneous hazardous substances
- 1,000 pounds of miscellaneous hazardous waste
- 50 lead acid/lithium batteries

Cost and Funding Mechanism for Removal:

- OSLTF: Cost to date - $325,320
- CERCLA: Cost to date - $0. Miscellaneous hazardous wastes, radiation sources, cylinders, and toxic chemicals were disposed of under state programs for toxic substances, thereby conserving CERCLA costs.
- Deliberate partnerships with the City of West Sacramento, State of California and USCG allowed each agency to leverage authorities for funding, ultimately keeping expenditures low, yet allowing for the complete abatement of pollution threats as well as debris.

Final Vessel Disposition: Hazardous substances and contaminated debris were disposed of by the State of California's Department of Toxic Substance and Disease Control via approved facilities. All oils were abated and disposed of using a commercial contractor hired by USCG. Vessels and non-contaminated marine debris associated with the response will be scrapped and disposed of via landfill.

Significant Challenges and Solutions:

USCG's decision to engage in evaluation and removal actions was based on several factors, including:

- Actual or potential exposure to nearby human populations, animals, and/or ecosystems from hazardous substances or pollutants; and
- Hazardous substances or pollutants in drums, barrels, tanks, or other bulk storage containers that posed a threat of release.

In this case study, it was the collaborative effort of all parties that resulted in the successful outcome of the removal of all pollutants and the vessel remnants as well. However, this will not be the case in every city and state. In scenarios where the vessel may remain, OSCs should investigate vessel removal options using internal authorities or the broader federal partnerships discussed in this guidance. In the coastal zone, the USCG OSC should investigate the use of the Commandant's Vessel Destruction request process. However, if this process is to be used, it is advised that District support be engaged early in the process to assist in coordinating with Area and Headquarters commands.

This case study represents the core elements for successful pollution abatement from derelict and abandoned vessels, concurrently realizing benefits to all parties and the environment, and underscores cooperative practices described in this document.

Appendix B: Technical Specialists and Special Teams

Appendix B includes information on the following technical specialists and special teams to assist the OSC/COTP:

- SUPSALV
- EPA Environmental Response Team (ERT)
- NOAA SSC
- NOAA MDP
- USCG Marine Safety Center (MSC) SERT
- USCG National Strike Force (NSF)
- The National Strike Force Coordination Center (NSFCC)
- Area Committee Members
- RRT

Special teams are outlined in the NCP, 40 C.F.R. Part 300.145. Special teams applicable to salvage and abandoned vessel operations include SUPSALV, NSF components, NOAA's SSC, and EPA's ERT. Title 40 C.F.R. Part 300.145(e) specifically addresses coordinated efforts of special teams for the purpose of salvage operations led by OSCs, noting that OSCs should seek assistance from special teams directly to ensure proper actions are taken. Further, technical specialists can be drawn upon, such as partner Area Committee members and the commercial response industry (e.g., the American Salvage Association).

SUPSALV

Under the Naval Sea Systems Command (NAVSEA), SUPSALV consists of four technical and operational divisions:

- The Diving Program Division is responsible for setting diving policy and approving U.S. Navy diving equipment.
- The Diving Certification Division serves as the System Certification Authority for U.S. Navy shipboard and portable hyperbaric systems.
- The Underwater Ship Husbandry Division develops techniques, procedures, and equipment to perform ship repairs.
- The Operations Division is a small cadre of government employees who manage and provide technical assistance for Salvage, Deep Search and Recovery, Towing, and Oil Spill Response operations. These operations can be accomplished using civilian contractors, military assets, or a combination.

SUPSALV has extensive experience in oil spill response and salvage in austere and logistically challenging environments. Operations include wreck re-floating, wreck removal, oil removal from submerged vessels, ship strandings/de-beaching, ship lightering, oil spill response (off shore, near shore, and in shore), towing/heavy lifting, and deep object search and recovery. Examples of SUPSALV assistance include:

- The survey of the M/V Montebello in the summer of 2011. SUPSALV sent two people to sit on the technical review board to help select the company that would perform the operation.
- The F/V MARGUN grounding near St. George Island, Alaska in 2009. The vessel was a 112-foot long fishing vessel that was grounded, requiring fuel removal to prevent pollution. Due to the remote location, it was difficult to find all the proper equipment to support the offload. SUPSALV maintains an ESSM base in Anchorage, Alaska with pre-positioned response

equipment. USCG requested 1,050 feet of 2-inch arctic grade hose that was quickly made available via C-130 transport.

- Fuel removal operations during the ex-USS CHEHALIS in Pago Pago, American Samoa. SUPSALV coordinated operations in conjunction with the Pacific Strike Team (PST) and Sector Honolulu in the removal of volatile fuels from the submerged wreck.

Under the Salvage Facilities Act (10 U.S.C. § 7361), the Navy is authorized to maintain a salvage capability that includes a capability for oil spill response. The Navy performs this function through both specialized Fleet Operating Forces (primarily salvage ships, tugs, and Mobile Diving Units) and SUPSALV. In addition, SUPSALV functions as an OSRO (33 C.F.R. Part 154) for most DOD facilities.

SUPSALV is a DOD representative to the NRT. Under the NCP, SUPSALV is designated as a special team to the OSC, and is a support agency under ESF-3 and ESF-10 when activated under the NRF for debris and pollution removal, respectively. During normal operations, SUPSALV would contract through its standing contracts, executing a military interagency purchase request (MIPR). In post-disaster operations where a disaster has been declared, unless the OSC is the DOD, FEMA may mission assign and fund this support via the Stafford Act, provided through USACE (ESF-3, as a channel clearance activity) or the USCG or EPA (ESF-10, as an oil or hazmat response activity). All Navy assets—SUPSALV and military—can be accessed by EPA or USCG OSCs, when available and at the approval of the CNO or appropriate Fleet Commander. For USCG OSCs, activities, both pre and post-storm, are accomplished with the USCG per a MOU dated 13 August 13 1980 and with USACE per an Inter Service Support Agreement dated 01 January 2011. EPA OSCs would access SUPSALV assets by activation of a standard pollution removal funds authorization (PRFA) request.

EPA ERT

The ERT is a group of EPA technical experts within the Office of Solid Waste and Emergency Response, who provide technical assistance on oil and hazardous substance releases, primarily to OSCs, in the U.S. and international waters. The ERT offers expertise in such areas as biology, chemistry, hydrology, toxicology, engineering, and health and safety. For oil spill incidents related to submerged or abandoned vessels, the ERT can perform the duties of SSC and/or serve as the head of the Environmental Unit under the ICS.

The ERT technically supports the NCP Subpart J (use of dispersants and other chemicals) program during oil spill response and recovery operations. The ERT technically evaluates alternative cleanup response technologies and assists with field implementation. The ERT can evaluate plans or implement the special monitoring of advanced response technologies (SMART) protocol. The ERT can provide advice on boom strategies/containment during abandoned vessel oil recovery operations.

For spills related to vessels, the ERT assists with hazard assessment, multimedia sampling and field analytical tools, the evaluation of the potential impacts to sensitive ecosystems and eco-toxicity risk to organisms in water and sediment, and the assessment of cleanup options. The ERT uses in-house oil fingerprinting techniques to evaluate mystery oil spills or weathered oil samples for source identification. The ERT evaluates innovative treatment methods, including potential biodegradation of oil constituents, based on analysis and rapid bench scale testing.

For submerged vessels, the ERT and EPA dive program have scientific divers, ROVs, and remote sensing tools to locate and evaluate environmental conditions in the vicinity of submerged vessels. ERT divers can provide technical support for commercial diving operations, including review of work plans and dive safety plans. The ERT and other EPA Dive Units have expertise in polluted water diving, proper personal protective equipment (PPE) for diving and topside personnel, and proper diver decontamination procedures.

NOAA SSC

NOAA science support is for "all hazards." The NOAA SSC experience can benefit an OSC/COTP during emergency responses to many types of incidents, including natural disasters, ship groundings, and terrorist incidents. For example, following the devastation from Hurricanes Katrina and Rita in 2005, NOAA Scientific Support Teams played major roles in rescue support, response to the multiple large oil spills, chemical container location and cleanup, and debris removal. The NOAA SSC also frequently supports vessel salvage and abandoned and derelict vessel operations and can access the NOAA hydrographic survey resources and the National Weather Service for incident specific weather forecasts. In addition, the NOAA SSC can provide support regarding legacy and historic shipwreck assessment and remediation, including access to the Remediation of Underwater Legacy Environmental Threats (RULET) database (Appendix D). The SSC can also be the liaison for NOAA and DOI trust resource programs, including scientists responsible for oil spill and coral grounding damage assessments, and NOAA's Maritime Heritage program, which includes a significant number of underwater archaeologists that can assist with the Sec 106 NHPA reviews.

NOAA Marine Debris Program

The mission of the NOAA MDP is to investigate and address problems that stem from marine debris through research, prevention, and reduction activities in order to protect and conserve our nation's marine environment and ensure navigation safety. The MDP has a history of assisting federal, state and local partners to address abandoned vessels, whether the boats are individual cases or many vessels abandoned from severe weather events such as Hurricanes Katrina and Rita and Superstorm Sandy. Though the MDP does not have dedicated funding to support a national abandoned/derelict vessel (ADV) effort, in the past, the MDP has:

- Provided scientific support to describe the movement of floating ADVs and determine potential environmental impacts;
- Assembled spatial, environmental and economic data vital to prioritizing ADVs for removal and disposal; and
- Hosted an ADV workshop providing a forum for many coastal state agencies to discuss unique challenges and develop solutions to address their ADV problems.

USCG MSC SERT

USCG MSC SERT is available to provide technical assistance. It has 8 – 10 staff engineers on call 24 hours a day, 7 days a week to provide immediate salvage engineering support to the USCG COTPs and OSCs. SERT can provide technical evaluations, including assessment and analysis of vessel stability, hull stress and strength, grounding and freeing forces, prediction of oil/hazardous substance outflow and expertise on passenger vessel construction, and fire protection and safety. SERT has mobile computing capability for on-scene deployment. The MSC maintains a database of over 5,000 hull files that can be used to generate computer models of vessels for salvage engineering. SERT maintains relationships with external agencies as well, including SUPSALV.

USCG NSF

40 C.F.R. Part 300.145(a) speaks specifically to the preparedness and response duties of the five components that make up the NSF. The NSF's area of responsibility covers all USCG Districts and Federal Response Regions.

NSFCC

Located in Elizabeth City, North Carolina, the NSFCC is responsible for support and standardization guidance to the Atlantic Strike Team (AST), Gulf Strike Team (GST), PST, and Public Information Assist Team (PIAT). The NSFCC also oversees the maintenance of the OPA 90 mandated Response Resources Inventory (RRI), OSRO Classification Program, and National Maintenance Contract (NMC)

for Strike Teams and other pre-positioned oil spill response equipment across the country. During an incident or potential discharge, the NSFCC can provide assistance in locating spill response resources, coordinating the use of private and public resources, and implementing ACPs.

- PIAT, also located in Elizabeth City, North Carolina, is responsible for assisting OSCs in meeting the demands for public information during a response. PIAT brings interagency crisis communication experience and technical expertise to help OSCs meet their objectives of truth and transparency of operations for the public. PIAT's use is encouraged any time the OSC/COTP requires outside public affairs support.
- AST is located in Fort Dix, New Jersey on Joint Base McGuire-Dix-Lakehurst.
- GST is located in Mobile, Alabama.
- PST is located in Novato, California.

The three NSF Strike Teams are the operational response components of the NSF and are responsible for providing highly trained personnel, technical expertise, and specialized equipment to assist OSCs during a pollution incident or threat of a pollution discharge. NSF Strike Teams assist with oil and chemical spill response, spill stabilization and containment, and monitoring or directing the response actions of responsible parties and/or contractors. OSCs may contact NSF Strike Teams directly for any assistance.

The NSF has extensive experience in oil/chemical spill response and vessel salvage assistance, usually working in concert with other special teams during salvage operations. Specific operations include product pumping capabilities, vessel damage assessment, source control, vessel lightering, protective booming, product spill containment, skimming, temporary storage, alternative response technology (dispersants and in-situ burns) components, and overall incident management/ICS implementation. Since its establishment in 1973, the NSF has been deployed during every major and many medium-sized pollution responses and salvage cases in the U.S.

American Salvage Association

The American Salvage Association was created as an association of professional salvors to provide an identity and assist in professionalizing the U.S. marine salvage and firefighting response capability. By doing so, the Association has helped to improve marine casualty response in North American coastal and inland waters. The American Salvage Association also educates government, industry, and the general public about the role of the marine salvor in protecting life, the environment, and property from the consequences of the perils of water transportation. To achieve these goals, the American Salvage Association promotes cooperation among its members to assure an effective, successful response in major incidents. As a commercial entity, the American Salvage Association can be a reference to the OSC/COTP during complex salvage and removal cases.

Area Committee Members

Each OSC/COTP in the Area Committee should document, as well as possible, the abandoned, derelict, and submerged wrecks throughout his/her Area of Responsibility and determine, as close as practicable, the degree of risk posed. Regional resource capabilities should account for any threat of discharge posed by the vessel or wreck, as appropriate. The information gathered should be incorporated into each applicable ACP, documenting the threat to the region and proximity to environmentally sensitive areas. This process will help identify potential risks within the area, and foster development of response and/or protection strategies.

RRTs

There are 13 RRTs, one for each of 10 federal regions, plus one for Alaska, one for the Caribbean, and one for the Pacific Basin. Each RRT maintains a RCP and is composed of state and federal representatives. Regional EPA and USCG officials co-chair the RRTs. Like the NRT, the standing RRTs are planning, policy, and coordinating bodies and do not respond directly to the scene. The RRT provides assistance as requested by the OSC during an incident.

Appendix C: State Abandoned Vessel Programs

The following summary contains applicable state statutes that relate to abandoned and derelict vessels. This section describes the statute as well as whether the program is funded. In some cases, such as Georgia, programs were funded for a time before funding was reallocated to other internal state programs. These state programs will provide the OSC/COTP with a broader awareness of possible partnership opportunities in their respective states. These partnerships can be utilized to leverage federal authorities toward pollution removal from active threats, and state authorities toward the abandoned vessel's removal and ultimate disposal. Many states are addressing the problem of abandoned vessels in their waters and many are considering new laws and regulations. This summary is only a starting point for understanding state programs and capabilities.

Table 3 – Summary of State Abandoned Vessel Programs

State	Statute	Description	Funding
Alabama	No program at this time.	No definition for abandoned vessel. Although Alabama does not have an abandoned vessel law, the state's salvage laws provide that any person may take up and secure "all property adrift." (*Id.* § 35-13-1)	No
Alaska	Alaska Stat. § 30.30.120	Abandoned and Derelict Vessels – A vessel left unattended for more than 30 days in state waters or on private property without authorization may be taken into custody.	No
California	HNC § 510-527	Wrecks and Wrecked Property of the Harbors and Navigation Code - Sec. 522 specifically addresses abandonment and removal.	Yes
Connecticut	Conn. Gen. Stat.§ 15-140c	Connecticut does not have a formal abandoned vessel program. CONN. GEN. STAT. § 15-140c provides local police departments and the Connecticut DEP with the authority to take abandoned vessels into custody.	No
Delaware	Del Code § 1303	Vessels Adrift or Abandoned on Public Property and Lost, Stolen, or Abandoned Property Relating to Vessels. Abandonment means 30 days without action by owner.	Yes; under Delaware National Resources and Environmental Control (DNREC)
Florida	FL Statutes - Title 28 FLC § 376.15 and 376.16	Derelict vessels; removal from public waters. Florida's Fish and Wildlife Conservation Commission (FWCC) is authorized and empowered to remove any derelict vessel as defined in §823.11(1) from public waters.	Florida State Grants
	§ 705.101 to 705.19 of Chapter 705	Lost or Abandoned Property. Authorizes law enforcement to remove abandoned property.	
Georgia	GA. Code Ann. § 52-7-72(a)	Abandoned/derelict vessels (defined as 5 days) posing a threat to public health or safety may be taken into custody.	Past funding via DNR

State	Statute	Description	Funding
Hawaii	HI. Rev. Stat. § 200-41 – 200-55	There is no formal state program in Hawaii. The Department of Land and Natural Resources addresses abandoned vessels through a collection of laws.	No
Illinois	625 ILL. Comp. Stat.45/3C-3(a)	The Illinois lost and abandoned watercraft laws do not expressly define "abandoned vessel". However, law enforcement agencies can authorize removal of a watercraft abandoned on waters for 24 hours or more.	No
Louisiana	LA Rev. Stat. § 34:843	The Coordinator is authorized to remove any vessel described in § 30:2469(A) and recover the costs of removal from the owner or operator of the vessel or structure. Louisiana Oil Spill Co-op has an abandoned oil barge program.	No
Maine	ME. Rev. Stat. Ann. tit. 12, § 1866(4)	Defined as "any watercraft that is inoperative and neglected…or that has been left by the owner in coastal waters without intention of removal."	Sub Lands Fund
Maryland	Maryland Code Title 8, Subtitle 7	State Boat Act. 8-721 to 8-723 and section 8-725-1 state that authorities may dispose of unclaimed vessel by auction/other means.	Waterway Improvement Fund (WIF)
Massachusetts	MA. Gen. Laws Ch. 91	In 2008, MA Legislature established the Abandoned Vessel Trust Fund to assist the Department of Conservation and Recreation (DCR) with the removal of abandoned vessels.	DCR Trust Fund
Michigan	MI. Comp. Laws § 324.76101 (a)	Michigan does not have a formal state program addressing abandoned vessels. This citation notes legal definition of "abandoned."	No
Minnesota	None	No formal state program addressing abandoned vessels.	No
Mississippi	MS. Code Ann. § 49-27-71	Mississippi Department of Marine Resources (DMR)'s Derelict Vessel Removal Program is authorized and funded through the state's Derelict Vessel Fund and Tidelands Trust Fund.	Yes
New Hampshire	N.H. Rev. Stat. Ann. § 270-B	There is no formal program; however, the Department of Safety has removal authority under chapter 270-B and the Pease Development Authority has authority to address abandoned vessels located in the state's ports and harbors.	Yes
New Jersey	N.J.S.A. 12:7C-7 et seq.	Pursuant to the Abandoned Vessel Disposition Law, abandoned vessels may be scrapped or disposed of via any means once custody is obtained. Abandonment means 30 days without action by owner.	No
New York	Title 10, § 130-139	Navigation Law. Derelict vessels; removal from public waters. Sheriff is authorized and empowered to remove any derelict vessel.	No

State	Statute	Description	Funding
North Carolina	N/A	North Carolina has no formal program to address abandoned vessels. North Carolina, at one time, had a pilot program for removal of abandoned vessels in the Neuse River Basin. The program has since expired.	No
Ohio	OH Rev. Code § 1547.01(B)(1)	There is no formal state program in Ohio that manages the removal and disposal of abandoned vessels. A collection of state laws sets forth the procedures for local law enforcement officers and private individuals to remove and claim abandoned vessels.	No
Oregon	Vol. 17, § 830.907 to 830.935	Navigation Law § 830.912. Derelict vessels; removal from public waters. Oregon State Marine Board is authorized and empowered to remove any derelict vessel.	Yes
Pennsylvania	30 PA. Cons. Stat. § 102	There is no formal state program that addresses abandoned vessels. This citation notes legal definition of "abandoned."	No
Rhode Island	R.I. GEN. LAWS § 46-22-2(7)	While Rhode Island passed abandoned vessel legislation, there is no formal state program yet to address abandoned vessels, due to re-allocation of program funding to other state programs.	No
South Carolina	S.C. CODE ANN. § 50-21-10(1)	South Carolina has a formal abandoned vessel removal program. South Carolina's abandoned vessel removal program is a multi-pronged effort involving a variety of state agencies and local governments.	Yes
Texas	TX Nat. Res. Code § 40.108	The Texas General Lands Office (GLO) has an Abandoned Vessel and Structure Removal Program.	Yes
Virginia	N/A	Virginia does not have a formal program to address abandoned vessels. Virginia Marine Resources Commission has authority to remove obstructions from state waters.	Marine Habitat Fund
Washington	Title 79, Chapter 79.100,	79.100.050 – Vessel may be scrapped or disposed of via any means once custody is obtained.	Yes

Appendix D: Pollution Mitigation from Legacy Wrecks

This Guidance defines "submerged legacy wrecks" as entirely beneath the surface and not presenting a hazard to navigation. Submerged wrecks are almost never economical to salvage for their intrinsic value. However, circumstances that may require raising sunken wrecks include intelligence value (e.g., GLOMAR EXPLORER operations), and historical interest (e.g., USS MONITOR). More frequently, the cargo or contents may be of interest, sometimes for historical artifacts (e.g., TITANIC) or intrinsic value (e.g., precious metals) but increasingly, sunken wrecks may need to be addressed to remove a potential environmental hazard from oil or hazardous substances. It is in this latter case that NCP OSC responsibilities most commonly intersect with submerged wrecks and, hence, the removal of oil and hazardous substances from these wrecks is the focus of the following discussion and flowchart.

Assessments

NOAA has spent a great deal of time and effort researching wreck assessment programs throughout the world and has applied its work toward the RULET program. In 2010, Congress directed NOAA to develop a list of the most ecologically and economically significant potentially polluting wrecks in U.S. waters, focusing on threats from oil pollution. NOAA ranked vessels as high, medium, or low potential oil pollution threats based on a broad multi-disciplinary weight of evidence that combines the historical evidence, archaeological interpretation, salvage engineering, and ecological and economic modeling. NOAA noted other pollution threats and hazards, including chemical cargoes and munitions when known, but these non-oil threats were not used in the ranking. Each vessel identified in the RULET assessment has been assigned a risk profile by NOAA, which has subsequently been delivered to each RRT and USCG Sector with recommendations based on the agencies' scientific and technical as well as resource trustee expertise. The national RULET report and the 87 individual risk assessments are available at: http://sanctuaries.noaa.gov/protect/ppw/.

The following list of characteristics was used by NOAA analysts to help determine the risk posed by latent pollution threats aboard legacy wrecks:

Characteristics and Remarks

Vessel Age

Vessels built prior to 1891 most likely did not use oil as their primary fuel source and therefore would not carry quantities posing a significant threat.

Vessel Location

Although any discharge is harmful, those wrecks within the U.S. EEZ located closer to environmentally sensitive areas warrant further scrutiny.

Vessel Construction

Vessels constructed during and after the 20th century will likely be constructed of steel, iron, or other resilient material.

Vessel Type

The vessel's service (e.g., tank ship, freight carrier, or passenger vessel) can give indications as to its potential capacities and fuel type.

Casualty Information

Whether the vessel sank due to catastrophic explosion or grounding will make a great deal of difference as to its potential remaining cargo aboard.

Route of Service/Logs

Consideration should be given as to the vessel's route of service and the type of cargo. If the vessel was beginning her voyage, it is probable she would be laden with fuel. Logs may also indicate where bunkers were last taken on.

Proximity to Sensitive Areas

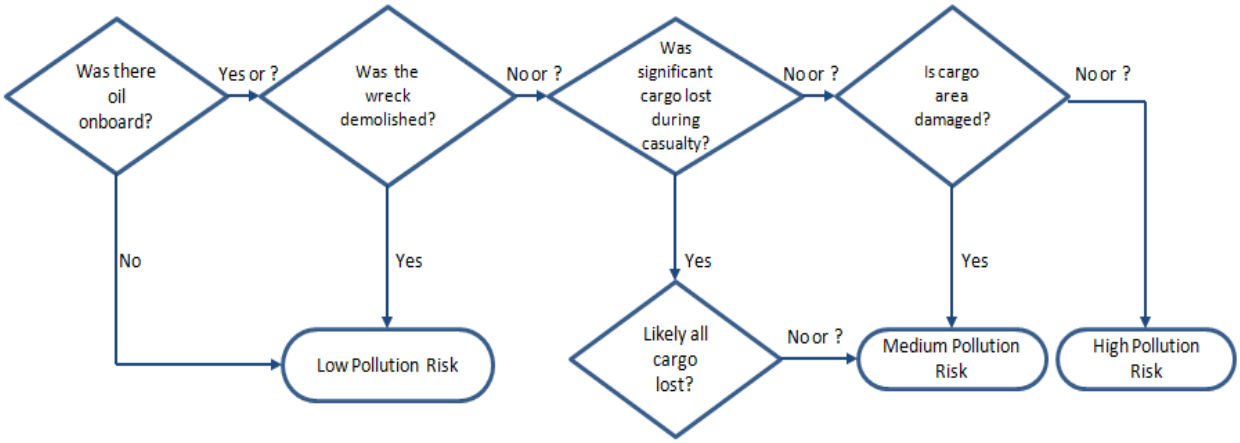
Identify the geographic area of oiling to water column, water surface, and shoreline resources, considering threatened resources at risk.

Socio-Economic Impacts

Spills from sunken wrecks have the potential to cause significant social and economic impacts, including fisheries, tourism, commerce, water supplies, and archeological sites.

Based on this NOAA assessment work, the figure below provides a guide for pollution threat decision making. The decision tree, which only evaluates physical integrity, was developed by the USCG SERT and used by NOAA in the development of the RULET Risk Assessment Vessel Profiles, and should be used to help inform OSCs on the decision-making process for potential pollution mitigation activities.

Figure 4 – Pollution Risk Decision Guide[83]



Typically, plans of the vessel or similar vessels are available. In addition, conditions of bunker and cargo loading may be on record. For 47 of the 87 vessels scored, an initial survey has been done or diver information is available that can give an idea of the condition and orientation (upside down, on side, or on keel; the more upright, the less chance of fuel remaining). This data can provide an idea of the likelihood of oil or hazardous substances remaining entrapped. From the total oil or hazardous substances potentially remaining on board as well as the orientation, compartmentalization, and condition of the vessel, an idea of the quantity and likelihood of a worst case discharge (WCD) can be derived. At that point, an assessment of the fate and trajectory of a WCD, given the type of oil, climatology, and currents can be performed through NOAA or other models. From this modeling, the probability and severity of potential impacts to environmentally sensitive areas can then be ascertained. No action or a plan for future defensive action (booming/skimming/dispersants if a discharge occurs) may be the most cost effective and environmentally benign alternative.

[83] Michel, J., Schmidt Etkin, D., et al. (2005). *Potentially Polluting Wrecks in Marine Waters.* Proceedings of the 2005 International Oil Spill Conference. American Petroleum Institute, Washington, D.C.

Authorities and Funding

The designated OSC/COTP has the authority to identify and address an environmental threat as described in previous sections of this document. In most cases of legacy submerged wrecks; however, the RP is either unknown or the subject of legal disputes of indeterminable longevity, and the eventual payment for operations or damages is questionable. Weighing the environmental risks against cost, the OSC/COTP can decide to proceed using the OSLTF (when the source is discharging or substantially threatens to discharge oil) or other appropriate government funds in these cases. Examples of this include the SS PRINCESS KATHLEEN (Alaska), M/V MONTEBELLO (California), and ex-USS CHEHALIS (American Samoa).

Priorities

Response priorities with regard to submerged wrecks have many influencing variables. However, there are several paramount response priorities that remain constant:

- Safety of responders and the public
- Minimize adverse impacts to the environment
- Minimize impacts to commerce infrastructure
- Public affairs outreach
- Stakeholder/community engagement

Key actions and decisions by the OSC/COTP that become the underpinning of the response include:

- Determining authority and identifying funding
- Conducting the initial assessment and determining courses of action
- Operational planning/management and execution
- Assessing current operational plan and making plan adjustments
- Reviewing public affairs program/transparency of operations

Contract Management

In cases where the RP is not known or in doubt, the OSC can choose to work with either a commercial contract (SS PRINCESS KATHLEEN, M/V MONTEBELLO), government assets (ex-USS CHEHALIS) or a combination. USCG OSCs should also engage their respective NPFC case manager, as well as the SILC Contracting Officer, prior to commencing operations.

With commercial contractors doing large projects, competitively bid contracts are usually required and must be carefully administered so that lengthy delays, generated by contractor protests, are not encountered. Bidders should be required to include a preliminary safety analysis and plan. In addition, to avoid extra costs, the SOW must be detailed enough to describe the full requirement/end state. However, the SOW should not be so detailed as to be overly prescriptive as to technical method of fulfilling the requirement (divers vs. Remote Operated Vehicles [ROVs], identity/type of platform, testing/sampling methods, etc.). The proposed technical methods must, however, be required to be disclosed by bidders so that the Technical Reviewers can fairly compare value and risk between proposals.

The required cost structure can prescribe fixed mobilization and demobilization costs combined with an operational day rate with number of shifts and estimated days to complete or, alternatively, an overall firm fixed price. Most other cost structures make price difficult to predict and control. Cost predictability and clarity is greater with government pre-negotiated contracts (BOAs, SUPSALV), but their use may not be appropriate and they may or may not be cheaper.

In the Action Plan Development section below, there are a number of decision points that should be reflected in the SOW. Foreseeable operational decisions made before the contract is competed will reduce both cost and controversy.

Action Plan Development

Assuming the initial assessment identifies a potential environmental threat that may be cost beneficial to remove, an Action Plan must be developed that, in rough form at least, informs the SOW. Key decisions include:

- ***Should removal actions be combined with the survey?*** In most cases, the assets required to remove oil or hazardous substances are different and considerably greater than those required to conduct a survey. Further, much is known about some wrecks and little about others. While the decision is a case-by-case judgment call, in most cases it is easier to control cost and risk by conducting a detailed survey that can inform removal planning (M/V MONTEBELLO, ex-USS CHEHALIS, and USS MISSISSINEWA). There are cases, however, where much is known of the wreck and necessary removal assets are reasonably available. In these cases, it may be cost beneficial to combine the survey and the removal operations (SS PRINCESS KATHLEEN).
- ***What tanks/areas should be accessed?*** Ships can have large cargo tanks; will have bunker fuel tanks, oil in machinery sumps/crankcases, small machinery space "day" tanks, and oily waste tanks; and may have oil or hazardous substances in drums and/or containers. These may have leaked and oil or hazardous substances may be trapped in spaces above. Due to difficulties locating and accessing these materials, it may take considerably more risk, time, and cost to either survey or remove oil or hazardous substances from some areas than others. Typically, the larger tanks are the easiest to access. At some point, there is usually a point of diminishing returns where large amounts of risk/cost are chasing small potential pockets of oil or hazardous substances. This point should be carefully analyzed and decided upfront.
- ***Divers vs. ROVs:*** By far the greatest determining factor in the efficient use of divers is depth. Interior surveys and the mechanical work associated with removal require surface-supplied or surface-tethered (vice free swimming scuba) divers at any depth. As depth and decompression requirements increase, the logistics footprint and cost increase dramatically. Shallower than 60 feet, most tasks can be done without delay for decompression. Depending on the dive profiles, a step increase in cost occurs somewhere in the 60 – 90 foot range as many dives may require decompression stops. Costs ramp up steeply between 100 – 190 feet as most dives require decompression stops, which become quite lengthy at the upper end. Another large step increase occurs at the 190-foot depth as divers must shift to mixed gas. Somewhere in the 120 – 300-foot range, depending on the work needed, saturation diving becomes more efficient and represents an exponential cost increase. Pressurized diving becomes impossible at around 1,500 feet and usually completely impractical well before that. Atmosphere (non-pressurized) diving is possible to around 2,000 feet and can be efficient in some applications; however, the cost, bulk, and handling requirements usually do not represent a worthwhile gain.

  Small, man-handled ROVs are typically simple optical/sonar sensors commonly used for searches, external inspections, and to monitor or guide divers. They are cheap and effective but do not have the power to perform the work necessary for surveys (sample hole drilling/grinding) or extraction operations. Larger working ROVs with sufficient power and manipulator functionality to perform mechanical work require extensive handling systems, skilled operators, and on-board technicians. Specialized tools for the specific extraction must usually be developed and tested on the ROV. That said, somewhere in the 190 to 1,000-foot range, ROVs become the best option in terms of cost and risk, especially for surveys. Useful work can be performed to around 20,000 feet but size, handling requirements, and logistic support increase dramatically with depth.

- ***Platforms:*** Platforms can range from a small boat to support a shallow external survey to a number of large ships and barges supporting a large recovery operation. The following focuses on larger platforms to support large operations. Platforms must be capable of supporting diving and/or ROV operations in the depth and weather conditions contemplated for the duration required. Action Plan development must specify the expected and worst case weather conditions, berthing requirements, deck space requirements, fueling requirements for topside equipment, communications requirements, freeboard requirements for both handling over the side (maximum) and weather (minimum), fendering requirements, personnel and cargo transfer, station-keeping requirements, waste disposal requirements (especially in waters where overboard sewage discharge is not permitted), decontamination requirements, and storage requirements for recovered product.

  The platform from which the underwater work is to be performed can be either a barge or a ship. Barges are much cheaper than ships, but must typically be fitted with portable living accommodations and weight handling equipment. In addition, ships or barges are safer, more reliable, and more stable in underwater operations than smaller platforms. However, barges typically must be moored. This can be done to thousands of feet but becomes less and less cost effective and less positionally secure as depth increases. Generally, the shallower and longer an operation, the more likely a moored barge or ship is the best option. If an unmoored ship is to be used as the underwater work platform, it must be able to maintain station either by constant maneuvering or with a dynamic positioning (DP) system. DP systems are designated DP1 through DP3 with increasing numbers reflecting increased redundancy and safety. Station keeping is tiresome and difficult to maintain without DP and risk of ROV accidents increases. Manned underwater operations require at least level DP2. Another consideration is the reliability of the ship's engineering plant. All the support equipment, the ROVs, and divers are idled but being paid if the ship has an engineering casualty. Further, ships must have enough open deck space to support the operational footprint. The cost and availability of suitable ships varies greatly with spot market conditions.

- ***Oil or hazardous substances removal methods:*** The basic technique for removing oil or hazardous substances from a submerged tank is a "hot tap" system, essentially a bolt-on flange with a valve mounted on it through which a hole is drilled into the tank. After the valve is closed, hoses and pumps can be mounted. As depth and fluid viscosity increase and temperature decreases, products become more difficult to pump. Injection of steam or hot water and/or use of a ring of injected water to reduce hose friction have made pumping possible to deeper depths (SS JACOB LUCKENBACH, SS PRINCESS KATHLEEN). However, depending on the viscosity and temperature, at some depth pumping through hoses becomes impractical and a specifically engineered solution must be devised. In M/V PRESTIGE, a tanker sunk off Spain, a lowered aluminum bell arrangement captured oil and it was raised and lowered to over 10,000 feet, at huge expense. Hot tap arrangements are unsafe for gasoline but work for diesel and all heavier oils.

- ***How clean is clean?*** This is related to the issue above (what tanks/areas should be accessed). There will invariably be small pockets of oil remaining in tank webbing and framing in tanks that have had product removed. Consider that the most easily available access points for tanks may not be at the absolute highest point. Will the decision be made to cut larger or new accesses and remove remaining pockets? The Action Plan should discuss at what point accessed tanks/areas are clean enough.

- ***Disposal of recovered oil or hazardous substances:*** The Action Plan should address the disposal of recovered product all the way to final disposition. Failure to have the disposal arrangements in place, permitted as necessary and verified, before product (characterized as hazardous waste) is removed can result in delay and increased costs. Removed oil or hazardous substances can be pumped to a barge, tanker, tank, or bladder. These in turn must take the oil or hazardous substances to a permitted facility ashore where it must be transferred by road or rail to a disposal or reuse facility.

- ***Wildlife Operations:*** Potential wildlife operations may be necessary (as with the LUCKENBACH operation) to protect state and federal trust resources. Best Management Practices (BMPs) should be

identified during the consultation phase of operational planning. Increased wildlife operations may require additional support on site, including observer platforms as well as the potential for prepositioned equipment and emergency response resources.

- ***War Graves and Historically Significant Wrecks:*** Procedures need to be in place to record and avoid disturbing artifacts and address human remains, if found.
- ***Operations Safety:*** The Action Plan should identify anticipated safety issues. In this regard, the Action Plan informs the SOW. In turn, the SOW will facilitate contract bidder requirements to include a preliminary safety analysis and plan. More detail appears below in the site safety section.

The following decision diagram should be used to develop an operational plan based on initial assessments of the wreck against a WCD, as described above.

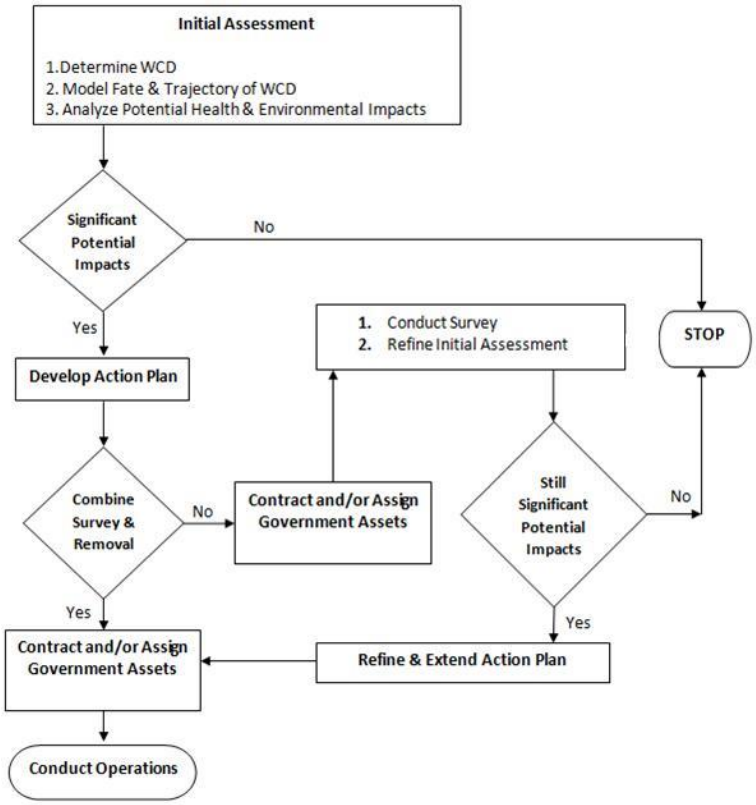


Figure 5 – Operations Plan Development

Site Safety Issues

Site safety and risk analysis are the most important part of any mission. Salvage and wreck operations are certainly no exception. Diving operations and fuel transfer make these types of operations even more hazardous. Thus, site safety should remain a top priority of all involved. Risk analysis begins with a job safety analysis, e.g., what are the tasks being conducted and what are the risks posed to responders/workers? A combination of the General Assessment of Risk model, as well as the ICS-form 208, Emergency Response and Site Safety Plan, will provide an excellent starting point.[84] Although not an inclusive list, some major safety issues may include:

[84] It is important to note that the General Site Safety Plan is a requirement set forth in Title 29 C.F.R. 1910.120(b)(4), as well as the Dive Safety Plan required by Title 29 C.F.R. § 1910.420 and § 421(d).

Hazard	Mitigation
Diving	
Cold water diving	Adjust dive tables to account for colder temps.
Wildlife contact	Implement Wildlife Monitoring Teams to monitor and report wildlife activity.
Depth of diving/amount of work required below surface	Diver work/rest should be regularly monitored. Dive Supervisor will ensure this activity is conducted.
Decontamination of personnel diving in contaminated waters	Expedited emergency diver decontamination should be established in advance to support rapid decontamination and employment of surface decompression in chamber.
Product Removal	
Explosion/static accumulation of oil product in containers	Ensure proper transfer protocols are followed and that safety precautions are taken to mitigate possible explosive atmospheres.
Hydrogen sulfide (H_2S) exposure from removed product (heated bunker oils, crudes, etc.)	Some operations require product to be heated. Ensure atmospheric monitoring and exclusion zones are appropriately established based on OSHA permissible exposure limits/ American Conference of Governmental Industrial (ACGIH) threshold limit values.[85]
Flammable vapors (gasoline, naphthalene, jet-a, etc.)	Ensure proper transfer protocols are followed and that safety precautions are taken to mitigate explosive atmospheres.
Heavy lift/overhead operations	Crane operations are common during major operations such as this. Proper site safety protocols include safety zones, licensed operators, and safety observers among others.
General Safety	
Slips, trips, and falls	General awareness should always be taken when on-site, considering the number of trip and fall hazards present. Non-essential personnel should be limited.
On-water operations	Personal Floatation is required for all on-water operations.
Thermal exposure (heat/cold stress)	Exposure standards should be consistent with OSHA recommendations, included in the Site Safety Plan, and briefed to all teams.
Crew fatigue	Exposure standards should be consistent with OSHA recommendations, included in the Site Safety Plan, and briefed to all teams.

Table 4 – Major Site Safety Issues

Fuel and Pollution Mitigation

Experience has shown that there are many ways to remove product from a submerged wreck. Numerous technical papers have been written on the subject and present good case studies on a variety of removal methods, including tank stinging, hot-tapping, and direct transfers. Considering that more than one option exists, OSCs should consider all options, and in many cases, a combination of options available to mitigate the pollution threat remaining aboard.

Within each of the above removal tactics, there are a multitude of activities and associated resources that make up a successful removal operation. The hot-tapping process is further described in the removal description noted in the case narrative on the SS PRINCESS KATHLEEN below.

Product Removal Process

[85] It is recommended that operational action levels be established that recognize the most stringent exposure level.

The product removal process contains many steps, but will always generally contain the same five core activities, noted below.

Figure 6 – Product Removal Process

Operations of this nature seldom include just one contractor or salvor. In many cases, operations will require multiple response entities, each providing a separate technical specialty. These providers should be managed by a project manager designated by the OSC for the purposes of coordinating the multi-faceted operation. The project manager should work in concert with the designated Operations Section Chief.

Product Removal Case Examples

The following examples consist of two methods of removal of product from a submerged wreck. These processes should be developed by the salvor after assessments have been completed and as much information has been captured as possible.

Despite the raging fire that sank her, the ex-USS CHEHALIS was able to keep her cargo of volatile aviation gasoline intact. Normally, a less volatile product could be removed using the "hot tap" method, as was used during the SS PRINCESS KATHLEEN. However, this method could create an explosive environment when considering the cargo remaining within the tanks of the ex-USS CHEHALIS. To circumvent hot tapping the tanks, a buoyed oil skimming system was introduced into the cargo tanks via the wreck's cargo hatches. The product was then removed using a pneumatic pump on a floating platform above the wreck. Several precautionary measures were put in place to prevent static accumulation, which is a universal risk with light cargos such as gasoline.

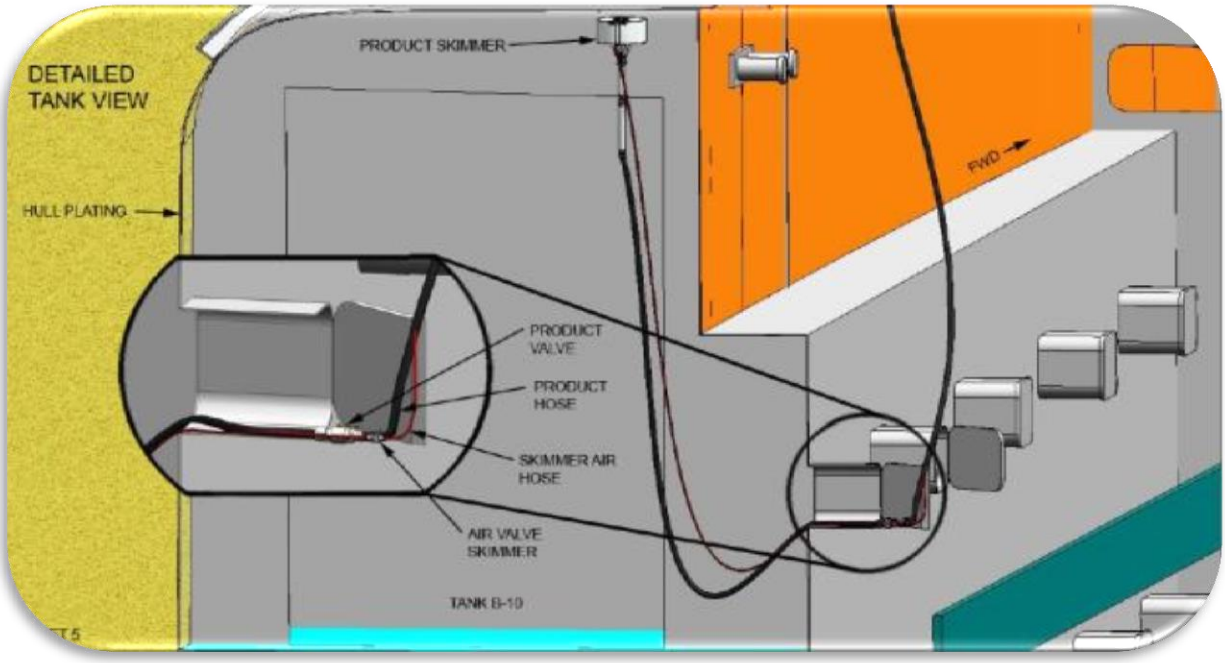

Figure 7 – EX-USS CHEHALIS Product Removal Process

In the early planning phases of the ex-USS CHEHALIS, it was assumed Singapore would receive the offloaded cargo as they had done for the USS MISSISSINEWA wreck oil operation. When the Singapore Port Authority was presented with a formal agreement, representatives from Singapore (Singapore National Environment Agency (NEA)) refused to allow any barge with recovered product to enter the country, citing the Basel Convention. This forced a last minute change to a critical element of the operation. Ultimately, a plan was developed whereby the recovered product was shipped back to the U.S. and transported and incinerated in Kansas.

To facilitate removing the cooled viscous bunkers of the SS PRINCESS KATHLEEN, the operations team developed a closed-circuit system of heating, re-circulating, and recovering bunkers from the wreck. A 20,000 gallon portable tank with heating coils was fastened to the deck of the primary work platform along with a hot water boiler, pumping, and heating equipment. The tank was filled with water and heated. The tanks on the SS PRINCESS KATHLEEN had been fitted with landing plates and flanges in advance using hot tap. A closed circuit loop was established from the tank being defueled on the wreck to the heated portable tank topside. As product was drawn from the wreck, clean heated water was gravity-fed back to the wreck via a closed-recirculation loop, cycling heated water through the tanks and freeing the viscous oil.

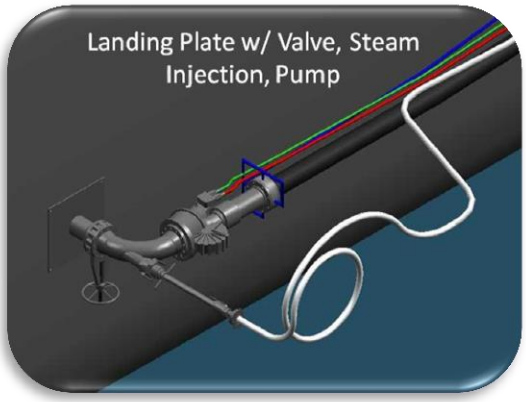

Figure 8 – SS LUCKENBACH Transfer Operations (1)

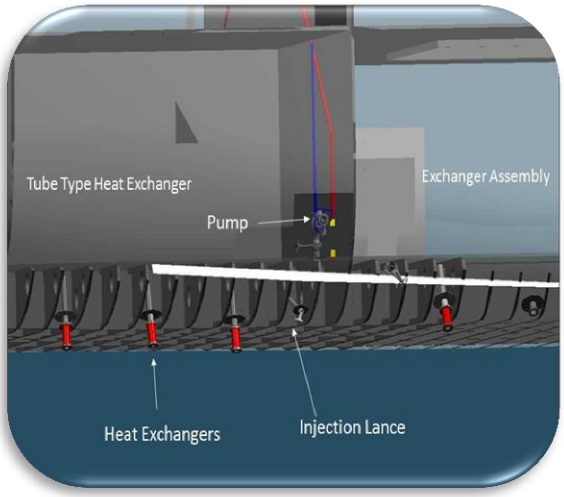

Figure 9 – SS LUCKENBACH Transfer Operations (2)

During the SS PRINCESS KATHLEEN's removal phase, once product was offloaded, the removed bunkers, when heated, created a higher level of H_2S than was expected from the original product analysis. Although atmospheric monitoring was regularly conducted and logged throughout the removal operation, additional measures were immediately activated after a mandatory stand-down, including vapor barrier; respiratory protection during tank monitoring and skimming; establishment of restricted areas; and chemical additives cycled through the product to reduce H_2S vapor.

The regular, daily evaluation of on-site operations proved to be a priceless effort throughout the operation, allowing the Operations and Planning staff to make minor operational adjustments and plan augmentations where necessary.

The SS JACOB LUCKENBACH, mitigated in 2003, drew many similarities to the SS PRINCESS KATHLEEN removal operations. The contents of the SS JACOB LUCKENBACH; however, were far more viscous, in some cases measuring nearly 200,000 centistokes (cSt). In an effort to remove the oil from the wreck, the oil within the tanks needed to be heated to over 78 degrees Fahrenheit. This was accomplished by hot-tapping the hull of the vessel and inserting specially designed heat exchangers and steam lances to increase the internal temperature of the tank and thereby decrease the oil's viscosity. Additionally, the submersible pumps were affixed with an annular water injection flange. The flange, affixed to the pump with a collar, injects a water sleeve within the discharge hose, thereby lubricating the inside of the hose and allowing the heavy viscous oil to move more freely with less internal surface tension. The operations removed nearly 94,000 gallons of fuel oil.

Appendix E: Abandoned Vessel Program Development

This appendix provides example programs proven successful in abandoned vessel removal and makes recommendations for local and regional abandoned vessel program development. The best programs are those that work in concert with one another. The following proposal for Regional Standardized Control Systems considers the cooperation of federal, state, and local agencies. These example programs in this Guidance can be shared with Area Committee and regional workgroup members to assist in developing regional solutions to the issue of abandoned vessels.

Utilization of a Central Reporting Entity and Database for Tracking of Abandoned Vessels

A central clearinghouse for abandoned vessel reports should be accessible by any entity, such as a local marina or harbormaster. Reports should be followed up on by the appropriate state environmental response entity. Vessels of significant threat should be documented in local ACPs.

Warning System

State and federal entities with jurisdiction over safe navigation and environmental protection should develop and deploy warning communication systems at the local level, either via the local COTP office, or through engagement with harbormasters and marinas. A warning system should clearly establish and articulate penalties for vessel abandonment. If state/local authorities can track or identify ownership interests before a vessel presents a hazard, it will help with administrative processes preceding removal.

Actions by State and Federal Entities to Identify Owners

The identification of a documented vessel owner is the best chance of removing a vessel that has been abandoned. Vessel registration is required in most states and can be used to track ownership.

Adoption of Standard Criteria for Hazard to Navigation and Environment

Criteria such as those used by USACE for hazards to navigation and USCG and EPA for environmental concerns should be employed as a benchmark for regional programs.

Establish Measures to Encourage Owner-Removal

Some state programs offer vessel turn-in opportunities or reimbursement of a percentage of disposal fees. These programs encourage owners to properly dispose rather than abandon.

Strict Liabilities for Non-Compliance of Vessel Disposal and Marking Requirements

Increased civil penalty standards may discourage owners from abandoning vessels when considering an affordable, legal alternative.

Award Rights to Marinas/Harbormasters

In the event of vessel abandonment within a marina or public harbor, states and local municipalities should consider the ability to award rights to the marina or harbormaster to facilitate removal and disposal. Further, created regional programs should reimburse marina/harbormasters for the cost of recovery and disposal.

Example of an Abandoned Vessel Program

Washington State Derelict Vessel Removal Program (DVRP)

This program has been developed for authorities in the State of Washington and is only presented here as an example.

Washington's 2001 Legislature authorized the use of money in the state toxics account for a grant program for local governments to clean up and dispose of hazardous substances on abandoned and derelict vessels. The 2002 Washington State Legislature then passed the Derelict Vessel Act, which provides certain local and state agencies with the authority and funding for the removal and disposal of derelict and abandoned vessels from the waters of the state. Prior to the 2002 legislation, the DNR had to rely on cooperation by the vessel owners, lengthy legal approaches such as trespass and nuisance abatement actions, and federal actions to address derelict vessels. The Program was further strengthened on May 13, 2013 when Governor Inslee signed legislation to hold vessel owners more accountable, as well as to help prevent vessels from becoming derelict or abandoned in the first place, improve enforcement, and bolster funding.[86]

Key Elements of the 2013 Enhancements to the DVRP:

- Permanently establishes the $1 surcharge on vessel registration that was set to expire at the end of 2013.
- Gives authority to the Washington Department of Ecology and authorized public entities to board vessels that meet the definition of "abandoned" or "derelict" for the purpose of assessing and correcting any potential threats to health, safety, and the environment.
- Changes registration-related offenses (such as failing to register) from a criminal misdemeanor to a civil infraction, making enforcement and collection of fines more realistic and efficient.
- Increases owner accountability by requiring owners of vessels longer than 65 feet and older than 40 years to obtain a vessel inspection before transferring ownership of the vessel to another party.

The DVRP Provides:

- Reimbursement of up to 90% of the cost of removal and disposal.
- Authorized public entities not able to undertake the removal of a derelict vessel may ask DNR to assume the lead.
- Priority for the use of funds is for vessels in danger of breaking up, sinking, or blocking a navigational channel, or vessels that present a risk to human health, safety, or the environment.
- Funding for the Program comes from an additional fee placed on annual vessel registration fees.
- Only authorized public entities in Washington State (DNR, Department of Fish and Wildlife Service, Parks and Recreation Commission, Metropolitan Park Districts, Port Districts, and any city, town or county with ownership, management or jurisdiction over the aquatic lands where the vessel is located) may participate in this program.

Appendix F: EPA Ocean Disposal Permitting Program

40 C.F.R. Part 229.3 Transportation and disposal of vessels.

(a) All persons subject to title I of the Act are hereby granted a general permit to transport vessels from the [U.S], and all departments, agencies, or instrumentalities of the [U.S.] are hereby granted a general permit to transport vessels from any location for the purpose of disposal in the ocean subject to the following conditions:

(1) Except in emergency situations, as determined by [USACE] and/or [USCG], the person desiring to dispose of a vessel under this general permit shall, no later than 1 month prior to the proposed disposal date, provide the following information in writing to the EPA Regional Administrator [RA] for the Region in which the proposed disposal will take place:

(i) A statement detailing the need for the disposal of the vessel;

(ii) Type and description of vessel to be disposed of and type of cargo normally carried;

(iii) Detailed description of the proposed disposal procedures;

(iv) Information on the potential effect of the vessel disposal on the marine environment; and

(v) Documentation of an adequate evaluation of alternatives to ocean disposal (i.e., scrap, salvage, and reclamation).

(2) Transportation for the purpose of ocean disposal may be accomplished under the supervision of the District Commander of [USCG] or his designee.

(3) Except in emergency situations, as determined by [USACE] and/or the District Commander of [USCG], appropriate measures shall be taken, prior to disposal, by qualified personnel to remove to the maximum extent practicable all materials which may degrade the marine environment, including without limitation:

(i) emptying of all fuel lines and fuel tanks to the lowest point practicable, flushing of such lines and tanks with water, and again emptying such lines and tanks to the lowest point practicable so that such lines and tanks are essentially free of petroleum, and

(ii) removing from the hulls other pollutants and all readily detachable material capable of creating debris or contributing to chemical pollution.

(4) Except in emergency situations, as determined by [USACE] and/or [USCG], the dumper shall, no later than 10 days prior to the proposed disposal date, notify the EPA [RA] and the District Commander of [USCG] that the vessel has been cleaned and is available for inspection; the vessel may be transported for dumping only after EPA and [USCG] agree that the requirements of paragraph (a)(3) of this section have been met.

(5) Disposal of these vessels shall take place in a site designated on current nautical charts for the disposal of wrecks or no closer than 22 kilometers (12 miles) from the nearest land and in water

no less than 50 fathoms (300 feet) deep, and all necessary measures shall be taken to insure that the vessels sink to the bottom rapidly and that marine navigation is not otherwise impaired.

(6) Disposal shall not take place in established shipping lanes unless at a designated wreck site, nor in a designated marine sanctuary, nor in a location where the hulk may present a hazard to commercial trawling or national defense (see 33 C.F.R. Part 205).

(7) Except in emergency situations, as determined by [USACE] and/or [USCG], disposal of these vessels shall be performed during daylight hours only.

(8) Except in emergency situations, as determined by [USACE] and/or the District Commander of [USCG], the [COTP], [USCG], and the EPA [RA] shall be notified forty-eight (48) hours in advance of the proposed disposal. In addition, the COTP and the EPA [RA] shall be notified by telephone at least twelve (12) hours in advance of the vessel's departure from port with such details as the proposed departure time and place, disposal site location, estimated time of arrival on site, and the name and communication capability of the towing vessel. Schedule changes are to be reported to the COTP as rapidly as possible.

(9) The Nautical Data Branch, N/CS 26, Station 7350, National Ocean Service, NOAA, 1315 East West Hwy, Silver Spring, MD 20910, shall be notified in writing, within 1 week, of the exact coordinates of the disposal site so that it may be marked on appropriate charts.

Case Studies

Maritime Salvage & Intervention

PLACES OF REFUGE

CASE STUDIES

DOLE AMERICA: Private wharf owner refused access to dry-dock services.

The MV DOLE AMERICA struck the Nab Tower in the Solent Approaches and sank with a cargo of fruit.

After re-floating this vessel needed dry-docking facilities to enable jury repairs to be affected to the vessel and in particular to a 13m gash in the way of holds 1 & 2 below the waterline.

Although the dry-dock was empty at the time there was a major ship refurbishment contract due in one week's time. Access to the dock was granted at first but later refused even as the casualty had covered over half of the passage from the site of re-floating, under tow and supported by sheerlegs, towards it.

The refusal was not lifted and the vessel had to make a further dangerous journey (still supported by the sheerlegs) to another repair facility.

Small general cargo vessel off Shetland: Refused entry by the SOSREP because of value of fish farm stocks.

During a severe storm this small cargo vessel was swept by a wave and the cargo of fishmeal was displaced. The vessel took on a severe list (35 degrees) and the crew were lifted off by CG helicopter. However a second vessel appeared as the weather began to moderate and managed to get a line onto the casualty. They requested haven in a nearby sheltered loch.

The loch in question however was populated by a large number of salmon farms containing aggregated stock of around £15 million.

The vessel itself only contained the cargo of fishmeal and MDO fuel; there was no risk to life and no significant risk to the environment if it sank on the open sea. The cost of contaminating the fish stocks with the MDO on the other hand was a real one and haven was refused on grounds of comparative value.

The vessel did subsequently enter the loch when its stability was assured and the weather had moderated further.

M/T MAGNITUDE: Granted entry to Milford Haven laden with 90,000 tonnes of HFO and a split in side of vessel.

Six days after the M/T PRESTIGE (70,000 tonnes HFO) sank we dealt with this vessel which was awaiting entry to the Haven to discharge. At daybreak the crew found themselves in the centre of an oil slick which was issuing from a visible crack in the side of the vessel.

Whilst the casualty transferred cargo from the tanks near the crack the SOSREP made contact with the Milford Haven Harbour Master who also held a meeting with his local environment Group to explain the situation. It was agreed that, despite the risk of pollution from the vessel by HFO, bringing the vessel into the port presented the least risk of pollution to the greater environment.

The vessel was finally brought into the port, boomed and discharged successfully with little or no pollution.

Since then the decision to allow the vessel to enter the Haven has been reviewed by the port authority and the Harbour Master has been instructed to refuse entry to a future vessel in similar circumstances.

Milford Haven have very good reason to feel the need for protection from legal action ensuing from pollution within their port and would insist that the Government took full responsibility for the risk in this sort of event by requiring a direction to admit the vessel.

AB BILBAO: Dangerous cargo – given shelter offshore and later brought into port for temporary repairs.

The AB BILBAO was making passage down the North Sea towards the Dover Strait into a south-west gale when an explosion blew off the first section of her single hatch-cover. This exposed her cargo of 3,300 tonnes of fero-silicone to sea and rain. The datasheets for the cargo showed that the presence of moisture would cause emissions of the gasses hydrogen, acetylene, arsine and phosphine.

The vessel was instructed to take shelter from the south-west winds offshore in the Margate Roads. It was realised that the vessel could not lie in this position for any length of time however as the weather was forecast to strengthen to force ten from the south-east. The problem was how to evaluate the real risk posed by the wet cargo.

The response team led by the SOSREP set about locating an expert source of information about the behaviour of the cargo. Eventually two sources of information were found – one of whom worked for the owners and the other as independent advisor to the SOSREP.

The risk was evaluated as low in real terms and the casualty was brought into the Medway Ports under Direction and there given temporary repairs without landing the cargo.

At one time there was a considerable body of environmental advise which indicated that major parts of the south east UK and parts of Holland should be evacuated. It was the impartiality and value of the independent expert advice that enabled the frontline parties involved to properly evaluate the real risk posed by the situation and take meaningful decisions.

MV WESTER TILL: 7,300 gt general cargo/container vessel on fire, IMO classified substances, suddenly diverted into a port of refuge

During the evening pallets of rolled paper on fire and stowed in the after hold beneath a deck cargo of containers was discovered as the vessel headed down the Channel from Antwerp. Attempts to extinguish the fire with CO2 were unsuccessful and a shore based fire fighting team and a salvage crew were transferred onto the casualty. It was known that there were quantities of cargo described as flammable liquids, corrosives, poisonous toxins and miscellaneous IMO classified items on board some of which were close to the site of the fire.

By the early hours of the morning the fire was considered to be smouldering and under control. Arrangements were made to bring the vessel into the port of Southampton so that cargo could be removed and water from shore-based fire appliances used to ensure the fire was out. All available fire appliances were tasked to the quayside at Southampton.

During the passage fire fighters entered the hold every 30 minutes to quench small flames and keep control of the fire. At around 10:50 the Salvage Master on board the casualty reported the fire had reasserted itself and was spreading rapidly – it could not be fought with the onboard resources and he needed to bring the vessel alongside at the earliest possible moment.

Within ten minutes all arrangements had been made to divert the vessel into the Portsmouth naval dockyard. Within 45 minutes of the fire report the vessel was manoeuvring alongside and the shore-based fire appliances from Southampton were making arrangements to fight the fire.

Because of the time constraints in this case the risk assessment had to be rough and ready and the co-operation of the Queen's Harbour Master at Portsmouth was vital – it was a case of independent responders each trusting in the others professionalism and working to what became a common objective – to extinguish the fire before it gained sufficient hold to disperse the known pollutants on board the casualty.

Annex WW

Assortment of Plans

Site Safety and Health Plan

Site Safety and Health Plan ICS-208-CG (rev 9/06)

Incident Name: _____ Date/Time Prepared: _____ Operational Period: _____

Purpose. The ICS Compatible Site Safety and Health Plan is designed for safety and health personnel that use the Incident Command System (ICS). It is compatible with ICS and is intended to meet the requirements of the Hazardous Waste Operations and Emergency Response regulation (Title 29, Code of Federal Regulations, Part 1910.120). The plan avoids the duplication found between many other site safety plans and certain ICS forms. It is also in a format familiar to users of ICS. Although primarily designed for oil and chemical spills, the plan can be used for all hazard situations.

Questions on the document should be addressed to the Coast Guard Office of Incident Management and Preparedness (G-RPP).

Table of Forms

Real World Site Safety Plan

ATHOS I

Site Safety Plan

MV ATHOS I
November 27, 2004

Prepared for Unified Command Staff
Revised December 7, 2004

SITE DESCRIPTION

Site generally referred to as: MV ATHOS I

Location: Delaware River near Paulsboro, New Jersey

Surrounding area: _x__ industrial, _x_ residential, _x_ rural, _x_ unpopulated, _x_other:
Topography: ____ rocky, _X__ sandy beach, _X__ docks, ____ cliffs, _X__ marshes,

Other: _____

Potential Hazards:

_X_Chemical Exposure
_X_Oxygen Deficiency
___ Ionizing Radiation
_X_ Cold/Heat Exposure
_X_Slippery and Uneven Surfaces
_X_Slips, Trips & Falls
___ Fire/Explosion
___ Confined/Enclosed Space Entry
_X_ Biological Hazards
_X__ Noise
_X_ Boat Operations

SITE CONTROL

All work will be conducted in accordance with established procedures and developed work plans.

- Anyone entering or departing a WORK AREA, or associated control zones, will report to the site supervisor
- No person will enter a site without knowledge of the approved Site Safety and Health Plan and associated site hazards.
- No person will enter a site without adequate training in hazardous waste emergency response/safety and health based on work assignment and applicable hazardous conditions.
- All personnel entering a contaminated area are required to decon prior to exiting the zone.

In the event clean up activities involve entry to industrial/commercial facilities, safety rules of the facility will apply as long as the safety rules do not contradict this Plan.

SITE SAFETY/OPERATIONS MAP

The site safety map includes the location of items such as: zone boundaries, washing, toilet/hygiene facilities, first aid equipment, fire extinguishers, command posts, equipment staging/storage, eating/rest areas, animal rehab/hazing stations, and locations of identified hazards. Any additional hazards encountered on site will be marked on the site map.

See Attachment A

SITE ORGANIZATION

See Organizational Chart in IAP, ICS Form 207.

HAZARD EVALUATION:

CHEMICAL HAZARDS (check appropriate category and attach MSDS if available)

Oils composed of an indefinite petroleum mixture. May contain benzene, toluene, xylene, naphthalenes, and polyaromatic hydrocarbons (PAHs) in concentrations that may vary widely depending on the source of the oil, weathering and aging.

Hazard Descriptions: May cause dermatitis by skin contact, nausea by inhalation, and eye irritation. Benzene can effect the blood and blood forming organs and is a carcinogen. Exposure to benzene, toluene, and xylene is most likely around freshly spilled oil and in poorly ventilated areas (such as in pits or under docks). Benzo(a)pyrene, a PAH, can cause skin cancer with prolonged skin contact. As oil weathers and ages, benzeo(a)pyrene becomes more concentrated because it evaporates more slowly than other components.

Basic Precautions: Stay upwind from fresh spills. Wear respiratory protection and chemical resistant clothing to prevent skin or eye contact. Periodically change clothing to prevent the hydrocarbon from soaking through and immediately change clothing if the hydrocarbon comes in contact with skin. Wash skin with soap and water when changing into street clothing, before eating/drinking, or when exiting to a contamination reduction zone. Flush eyes with water if exposed directly to the hydrocarbon. Do not induce vomiting if hydrocarbon is swallowed - contact a physician immediately. A urinary phenol test is required at the end of the shift if exposed to benzene.

Initial air monitoring was completed as of 1400 Hours, 11/28/04. Results indicated no detectable concentrations of benzene at sites monitored.

Additional air monitoring will be conducted on an as needed basis or as requested by Unified Command.

GENERAL SAFE WORK PRACTICES

The following safe work practices will be adhered to while on site (check those that are appropriate & add any additional).

_X_ **BUDDY SYSTEM:** The buddy system will be observed inside the Work Area (EXCLUSION ZONES). Personnel must work within sight of their assigned partner at all times.

_N/A_ **OCCUPATIONAL MEDICAL MONITORING**: Personnel shall be provided occupational medical monitoring program in accordance with 29 CFR 1910.120.

_X_ **LIGHTING:** Fixed or portable lighting will be maintained in dark areas or for night work.

_X_ **SLIPPERY ROCKS AND SURFACES:** All personnel in the work area will wear chemical resistant safety boots (with steel toe). Neoprene is a common material/fairly resistant to many oils.

_X_ **WORK NEAR WATER:** All personnel working in boats, on docks, or near water, will wear Coast Guard approved personal flotation devices (PFDs) or work vests.

_X_ **HEAT STRESS:** Guidelines developed by ACGIH can be utilized in determining work/rest periods. fluids will be available and encouraged during rest periods.

_X_ **COLD STRESS:** Adequate warm clothing, rest opportunities, exposure protection, warm and/or sweet fluids will also be available. For prolonged water temperatures below 59 degrees F, or a combined water and air temperature less than 120 degrees F, exposure suits should be worn by personnel working/traveling in small boats, and immersion suits shall be available for vessel operations other than small boats.

_X_ **HIGH NOISE LEVELS:** Hearing protection will be used in high noise areas -- generally where noise levels require personnel to raise their voices to be heard or in areas exceeding 84dBA.

_X_ **ELECTRICAL HAZARDS:** Electrical hazards are designated on the site map, and shall be marked with suitable placards, barricades, or warning tape as necessary.

_X_ **CONFINED SPACES:** Open manholes, trenches, or similar hazards should be noted on the site map including work under docks and piers.

_X_ **MUD:** Dangerous mud flats posing a hazard are off limits to all personnel.

_X_ **CARBON MONOXIDE:** Equipment operators will ensure personnel do not linger near exhaust pipes.

_X_ **UV LIGHT EXPOSURE:** Sunscreens of protection factor 15 (or greater), and UV tinted safety glasses should be available for response personnel, as needed.

_X_ **HELICOPTER OPERATIONS:** Pilots shall provide safety briefing for all passengers.

_X_ **MOTOR VEHICLES:** Drivers will maintain a safe speed at all times.

_X_ **DRUM HANDLING AND SPILL CONTAINMENT**: To the extent possible, utilize mechanical devices, drum slings or other mechanical assisting devices to handle drums and containers.

Temporary holding/staging areas for drums and containers containing waste materials shall be constructed to contain spillage, run-off, or accidental releases of materials.

Manual lifting and handling of drums and containers shall be kept to a minimum.

_X_ **CONFINED SPACE ENTRY:** If a confined space must be entered or hot work conducted in a confined space, a specific confined space entry work plan and confined space work authorization (permit) will be developed for that operation.

_X_ **POISONOUS PLANTS:** (Poison ivy, oak, or sumac)

_NA_ **SPECIAL PPE**

___Thermal Protection Proximity Suits, short duration—close proximity at radiant heat temperatures as high as 2000°F. Respiratory protection must be provided.
___Fire Entry Suits, protection for brief entry into flame environment at temperatures as high as 2000°F. Not designed for rescue operations. Respiratory protection must be provided.
___Turn out gear—general fire fighting protective clothing.

_X_ **DECONTAMINATION PROCEDURES:** Contaminated personnel will decontaminate in accordance with the instructions of the Safety Officer. See the Decon and layout provided as Attachment B.

_X_ **SANITATION & PERSONAL HYGIENE:** Potable water, non-potable water, toilets and personal hygiene facilities shall be readily available.

PERSONAL PROTECTIVE EQUIPMENT (PPE)

Level D as described below will be used on site:

Level D (no known hazard(s))

- **Tyvek-type and/or rain gear.**
- **Hard hat when overhead hazards exist**
- **Safety glasses/goggles/face shield**
- **Work shoes**
- **Disposable boots**
- **Chemical resistant Gloves**
- **Hearing protection**

Level C (known hazard(s) are atmospheric contaminants, liquid splashes or other contact that will not adversely affect the skin.

- Hooded disposable - chemical resistant
- coveralls
- splash suit
- Cartridge Respirator - air purifying
  - Full face
  - Half-mask
- Gloves - chemical resistant
- Boots - chemical resistant (work shoes)
- Hard hat
- Escape pack
- Means of communication
- Safety glasses/goggles/face shield

Level B (The hazard type and atmospheric concentration have been identified and require a high level of general and respiratory protection.

- Pressure Demand
  - SCBA
  - Air supplied respirator
  - Escape pak
- Hooded Chemical resistant/disposable
  - Coveralls
  - 2 piece splash suit
  - Gloves - chemical resistant (inter-outer)
  - Boots - chemical resistant (work shoes)
  - Hard hat
  - Means of communication
  - Safety glasses/goggles/face shield

Level A (The hazard(s) have been identified and require the highest level of protection for skin, eyes and respiratory system)

- Pressure Demand
  - SCBA
  - Air Supplied Respirator
  - Escape Pack
- Fully encapsulated-chemical protective suit
- Coveralls
- Long underwear
- Gloves - chemical resistant (inter-outer)
- Boots - chemical resistant (work shoes)
- Hard hat
- Radio communication

NOTE: The SAFETY OFFICER may modify PPE on a case by case basis. Special operations may require a different PPE level.

EMERGENCY PROCEDURES

In all cases when an on-site emergency occurs, personnel will not reenter the work area or restart work until the condition resulting in the emergency has been investigated by supervisory personnel, hazards have been reassessed; the site safety plan revised, as needed; and site personnel briefed on any changes in the operation or safety plan.

Emergency Medical Procedures:

- Call for assistance if necessary. Report all injuries to your supervisor.
- Do not attempt to move seriously injured personnel, call for assistance.

Emergency Fire Procedures:

- DO NOT attempt to fight fires other than small fires. A small fire is generally considered to be a fire in the early stages of development, which can readily be extinguished with personnel and equipment in the immediate area in a few minutes time.
- YOU MUST call for help immediately. Alert nearby personnel and notify supervision.
- When the fire alarm is sounded, personnel shall immediately leave the work area to the designated entry/exit point for role call.
- The Site Safety Officer or the Fire Department shall ensure that the fire is extinguished BEFORE restarting work.

EMERGENCY NUMBERS

FIRE 911

MEDICAL 911

POLICE 911

EVACUATION PROCEDURE

All contractors will develop the following procedures to specific to their work force/site.

EVACUATION & FIRE SIGNAL(S)

PRIMARY EVACUATION ROUTE

SECONDARY EVACUATION ROUTE

ASSEMBLY POINT

COMMUNICATIONS

General signals:

- **THUMBS UP:** I'm OK/I agree.
- **THUMBS DOWN:** don't agree.
- **HANDS ACROSS THROAT:** out of air/trouble breathing.
- **GRAB HAND/ARM:** come with me.
- **HANDS ON HEAD:** I need assistance.

For more detailed communication procedures and information, refer to the Communications Plan as developed for the IAP.

SITE SAFETY BRIEFINGS/MEETINGS

All personnel, employees, contractors, subcontractors and visitors will be provided with an initial site safety plan briefing to communicate the work plan and nature, level and degree of hazards expected on site.

Personnel will also receive regular briefings when significant changes are made in the work procedures or safety plans. At a minimum these meetings will describe the work to be accomplished, discuss safety procedure changes, and note any items which need to be passed from others. General safety training topics should also be covered based on points raised in previous meetings and the site safety plan attachments. Document all safety meetings.

The responsibilities of the SITE SAFETY OFFICER include (but are not limited to):

- Coordination of all safety and health concerns for the entire work site;
- Keeping the plan current; and
- Liaison with safety officers from other organizations.

Information Officer

SAFETY AND HEALTH CONCERNS

Site safety plans must provide a set of control measures to minimize the risks to personnel. Possible site control measures are described below.

Site Security and Access Controls:

Safety and health risks can be significantly reduced by limiting access to work areas. People entering work areas, without adequate training, or without adequate supervision create a needless risk for other response personnel as well as themselves.

Response personnel and equipment need to leave contaminated areas in a manner which minimizes the spread of possible contaminants to clean areas or equipment.

Site security can also help prevent illegal disposal of other hazardous products in the response area.

Use of Control Zones. At hazardous materials incidents control zones are established to limit personnel access to contaminated areas and prevent the spread of contamination. This helps protect personnel and minimizes further damage to the environment.

Anyone entering or departing a work area, or associated control zones, should report to the designated recorder for that area. The site security officer enforces this policy at all times.

No person should enter a site without reading and subscribing to the approved Site Safety and Health plan.

No person should be allowed to enter a site without adequate training in hazardous waste operations safety and health; based on work assignment and applicable hazardous conditions.

Cold Zones. These are minimal exposure areas maintained as uncontaminated locations for support functions. Command posts, food service areas, and new equipment storage and staging areas are examples of cold zone support functions. This zone is also called a "clean zone" or "support zone".

Hot Zones. Defined areas of exposure hazards. Hot zones should extend far enough to prevent adverse effects to unprotected personnel outside of the zone.

For oil spills the impacted area where oil recovery is being conducted is typically treated as a hot zone. This zone is also referred to as "restricted zone", or "exclusion zone".

Warm Zones. These zones are where many control functions take place (e.g., personnel log in and out, personnel are decontaminated and dirty equipment is stored

or decontaminated). These zones are also called "decontamination," "contamination reduction," or "limited access zones."

Access control. The warm zone includes control points for the access corridor and thus assists in reducing the spread of contamination. A site recorder should keep track of personnel and equipment passing through the control points. This is important for project documentation and for safety considerations.

Decontamination area. An area within the warm zone (set aside) for decontamination of personnel, or equipment moving out of the work area (hot zone). The decontamination area should provide facilities for personnel to store contaminated clothing and equipment. Personnel must be able to wash their hands and faces before eating, drinking, smoking, or departing the work area. In some cases, showers may be required for personnel removing a contaminated clothing and changing into street clothing.

A clean sheltered area associated with the decon area, should be set aside for breaks. Rest and rehab will often be needed to control heat and cold stress hazards. Appropriate fluids (warm for cold stress conditions, and cool for heat stress conditions) should be available.

Smoking should be restricted to an area where hands can be washed first and where there is no significant fire hazard.

Marking of Zones. Zones should be marked as needed to control traffic and enforce decon procedures. Placards, barricades, traffic-cones, and/or boundary tape can be used for this purpose. The site safety officer should periodically inspect the effectiveness of boundaries.

An example of a color coding scheme might be orange, red, or black and yellow for exclusion zones,yellow for contamination reduction zones, and green or white for support zones.

Site map(s) should be developed and modified as necessary to cover the entire work area. It may be necessary to develop more detailed maps for individual sectors. Maps should be attached to the Site Safety Plan.

The site map(s) should include:

Control Zones.

The decontamination layout, equipment storage, temporary waste storage areas, toilets and personal hygiene facilities.

Emergency equipment such as fire extinguishers, first aid kits, eye wash stations, and stokes litters. If emergency medical evacuation can be accomplished by vehicle, maps should include routes to nearest hospital.

Evacuation routes and post-evacuation assembly areas.

Command post(s).

Staging areas for resources such as arriving personnel, new (clean) equipment, or visitors.

Rest and rehab support areas (e.g., food, fluids, and shelter).

Adjacent restricted operations (by other teams) should be noted on applicable maps. Examples include :

- animal rehab, capture, or staging;
- bird hazing stations; high pressure wash, bio-remediation, and dispersant work areas
- HAZMAT Team operations.

The location of identified safety hazards should be identified, known and understood by all personnel. The following are examples:

- underground electrical cables,
- overhead cables,
- pits, trenches, open holes/hatches,
- hearing protection areas,
- hard hat areas, and
- suspected locations of poisonous plants, insects, or animal hazards.

Access/Egress, and Dangerous Work Surfaces

Access/Egress. Spill response often requires getting personnel into isolated locations, damaged vessels or facilities, or other difficult to reach areas where it will be awkward for personnel to get to the work location. Adequate secured ladders, ramps, or other access must be provided.

Oily surfaces. Oily/slippery surfaces are a primary concern. Oil/chemical soaked boots present a skin contact hazard and slipping hazard. Personnel working around oily/chemical soaked surfaces should wear rubber safety boots with textured bottoms. Boat crews may consider substituting clean deck shoes with textured soles.

Damaged surfaces. Old or damaged deck plating, piers, or building floors may be a trip/fall hazard. Personnel should be restricted from working on

these locations or temporary surfaces should be constructed/installed as necessary.

Lighting. Fixed or portable lighting must be maintained for dark areas or work after sunset. Sufficient illumination should be provided at a minimum to meet the requirements of TABLE H-120.1 (Minimum Illumination Intensities) of 29 CFR 1910.120(m).

Work on or near the water. All personnel working in boats, on docks, or generally within several feet of water deeper than waist high, should wear Coast Guard approved personal flotation devices (PFDs) or work vests. Under hypothermia conditions it may be necessary to use insulated flotation suits. A boating safety briefing should be provided for all personnel using boats.

Small aircraft safety. Personnel working around or flying in rotary or small fixed wing aircraft should receive a safety briefing from the pilot before flight. In particular - safe approaches/exits, the locations of floatation gear, and emergency exits.

High Noise Levels. Hearing protection should be used by all personnel routinely working in high noise areas (84 dBA or 90 dBA). Locations likely to exceed this level include the vicinity of vac-trucks, heavy equipment, pumps, generators, and bird hazing stations. Generally, where noise levels require personnel to raise their voices to be heard, hearing protection should be used.

Animal hazards (insects, snakes, wildlife, etc.). These hazards are very site-specific. Specific controls should be developed in consultation with local game/wildlife officials, health service representatives, or other experienced individuals (e.g., local utility companies often face these hazards regularly). Personnel should be briefed on where potential hazards are and provided, if possible, visual familiarization.

Wildlife hazards are one of the most frequently encountered hazards. This can range from oily waterfowl to bears. Personnel should not underestimate the safety (and health) hazards associated with oily/injured bird or mammal species. Sharp bills can injure eyes in particular. These animals are frightened and very defensive at the approach of people, and are often stronger than they appear. Dead animals in general, should only be handled by specially trained personnel.

Insects Hazards (e.g., mosquitoes and ticks). General controls might include long sleeved clothing and insect repellent available for all personnel in designated areas.

Poisonous Snakes. General controls include identification training, knee high rubber boots, and snake bite kits for personnel in designated areas.

Poisonous Plants (e.g., poison ivy, oak, and sumac). Long sleeved clothing should be worn in areas containing these plants. Areas known to contain these plants should be marked/posted to the extent possible. Emergency medical personnel should prescribe first aid treatments.

Electrical Hazards. Electrical power lines (buried or overhead) should be marked on applicable project maps and physically marked in the field as necessary.

Carbon Monoxide. Vehicle/equipment operators should ensure that personnel are not allowed to linger or work near exhaust pipes.

Falling Objects. Hard hat areas determined by site safety personnel should be noted on site maps and enforced for all personnel entering these areas.

UV Light Exposure. Sunscreens of protection factor 15 (or greater) and UV tinted safety glasses should be made available for response personnel as needed to prevent overexposure to UV light.

Power Tools. Detailed requirements for hand and portable power tools (including jacks and lawn mowers) are found in 29 CFR 1910.241 through 247.

Use insulated tools with the insulation in good condition. Power tools should also be of the grounded type.

Ensure adequate guarding of hand tools.

Extension cords should also be grounded, have insulation in good condition, and have appropriate lengths and gauges.

Avoid electrocution hazards. In particular, power tools should not be used outdoors when it is raining or around wet surfaces.

Eye protection should be used when working with power tools.

Handling drums, containers, and heavy loads. 29 CFR 1910.120(j) has specific requirements regarding the handling of drums and containers on site. There may be many containers used at a spill site ranging from plastic bags to over pack drums to very large roll-off containers.

Some of the key elements:

- Use containers that are in good condition and adequate for the selected use.

- Containers being transported for disposal must be properly labeled.
- Containers being kept at temporary disposal staging areas must be held in containment areas that will prevent runoff and leaching of oily residues. Fire fighting-provisions should be reviewed.
- Personnel should not be allowed to work under equipment lifting loads.
- Unassisted manual lifting of heavy containers should be avoided. Mechanical equipment, lifting aids (hand trucks or support belts) , and partner lifts should be encouraged.
- Periodically personnel should be reminded of proper lifting procedures.

Confined Space Safety. Confined spaces should not be entered unless a specific plan has been developed for the space(s) of concern. Confined spaces must first be tested and appropriate documentation posted for entrants (e.g., confined space entry permit or marine chemist certificate). Personnel entering these spaces must be specially trained and equipped for confined space entry.

When confined spaces are present on a site, measures must also be taken to prevent accidental entry into confined spaces by untrained or unprepared personnel. Confined spaces should be noted on site safety maps and reviewed during site safety briefings. Warning signs or barriers may also be needed to prevent accidental entries. Personnel working around confined spaces must understand the nature, hazards, and policy regarding confined spaces.

Heat Stress Considerations. Safety personnel should make heat stress determinations throughout the day. If it is determined that a heat stress hazard exists an alert should be passed to all to implement periodic rest periods. Fluids should be readily available.

Health Concerns: Excessive exposure to a hot working environment can bring about a variety of heat-induced disorders.

Heat Stroke. Unless the heat stroke victim receives quick and appropriate treatment, DEATH CAN OCCUR. Any person with signs of symptoms of heat stroke requires immediate hospitalization. While waiting for medical assistance first aid should be administered.

Heat Exhaustion. In most cases, treatment involves rest in a cool place and drink plenty of liquids. Victims with mild cases of heat exhaustion usually recover spontaneously with this treatment.

Preparing For Work in The Heat. Healthy personnel are generally capable of adjusting to the heat. This adjustment usually takes about 5 to 7 days during which time the body will undergo changes that will make continued exposure to heat more endurable.

Work/Rest Periods. Whenever possible work should be distributed evenly with regular breaks scheduled. Providing cool rest areas in hot work environments considerably reduces the stress of working in the heat. Rest areas should be shaded and as close to the work area as possible. Short but frequent rest provides the best benefit.

Drinking Fluids. Most heat disorders involve excessive dehydration. It is essential that water intake during the workday be about equal to the amount of sweat produced.
Personnel should be encouraged to consume 5 to 7 ounces of fluids every 15 to 20 minutes to replenish the fluids.

There is no optimum temperature of drinking water. Most people tend to drink cool fluids.

Protective Clothing and Heat Stress. Clothing inhibits the transfer of heat. Where the air temperature is lower than skin temperature clothing reduces the body's ability to lose heat into the air. When air temperature is higher than skin temperature clothing helps to prevent the transfer of heat from the air to the body. The advantage of wearing additional clothes, however, may be nullified if the clothes interfere with the evaporation of sweat (such as rain slickers or chemical protective clothing).

Cold Stress. Frostbite and hypothermia are the two major hazards of working in cold temperatures. A cold environment can reduce the temperature of the body and cause shivering, reduced mental alertness, and sometimes loss of consciousness. However, a healthy worker who is properly protected and takes reasonable precautions can function efficiently and safely in cold environments.

Safety personnel should make cold stress determinations throughout the day when temperatures fall below 40 degrees F. Many of the protective methods for heat stress also apply to cold stress:

- Shelter (warm),
- fluids (warm), and
- work/rest cycling (to warm up in shelters).

Factors affecting cold exposures. Factors that can contribute to cold injury include exposure to humidity and high winds, contact with moisture or metal, inadequate clothing, age, and general health. Physical conditions that can worsen the effects include fatigue, allergies, vascular disease, smoking, drinking, and certain specific drugs or medicines. The actual effects of a cold environment on the body also depend upon how well the skin is protected. Environmental factors affecting cold stress include wind and humidity, as well as temperature.

Hypothermia. Hypothermia is perhaps the most serious cold injury because it is a generalized (threatening the whole body) injury which can therefore be life threatening.

Hypothermia is an abnormally low body temperature caused by exposure to cold in air or in water. Hypothermia results as the body loses heat faster than it can produce it. Air temperature alone is not enough to judge the cold hazard of a particular environment. Hypothermia cases often develop in air temperatures between 30-50 degrees. When you figure in such factors as wind chill, temperature can be significantly lower.

Warning Signs

Pain in the extremities may be the first warning of dangerous exposure to cold. Severe shivering must be taken as a sign of danger requiring removal from the cold exposure. A worker should go immediately to a warming shelter if any of the following symptoms occur:

- Pain in the extremities (or frostnip),
- Onset of heavy shivering,
- Excessive fatigue,
- Drowsiness, or
- Euphoria.

Other cold stress injuries:

- Frostbite is characterized by whitened areas on skin; a burning sensation; blistering; and the affected parts become cold, numb, and tingling.
- Frostnip is a condition where the skin turns white but without the severity of frostbite.
- Acrocyanosis is characterized by cold hands and feet that turn blue and sweaty.
- Trench foot is an edema (swelling) of the foot with tingling, itching, severe pain, and blistering. It is caused by the feet being exposed to cold and dampness.
- Raynaud's disease includes symptoms such as fingers turning white and stiff; intermittent blanching and reddening of the fingers and toes; the affected area tingles and becomes very red or reddish purple.

Evaluating cold exposure hazards. Common sense will generally dictate how much clothing to wear and when to get into a warm area in most cases. However, some work environments require more complex evaluation.

Preventing cold stress.

- Reduce manual work loads.
- Prevent dehydration.
- Provide warm locations and plenty of breaks.
- Provide wind or draft barriers both inside and outside to limit exposure to air movement.
- Schedule the coldest work for the warmest part of the day. Move work to warmer areas whenever possible. Assign extra workers to highly demanding tasks. Make relief workers available for workers who need a break.
- The buddy system is important when working in stressful environments.
- Avoid fatigue/stress by ensuring sufficient sleep and good nutrition are to maintain a high level of tolerance to cold.
- Provide sufficient warm clothing. The most important parts of the body to protect are the feet, hands, head, and face.

Medical Surveillance. 29 CFR 1910.120(f) requires medical surveillance for certain categories of personnel. The four primary categories are:

1. Members of hazmat teams (as defined in the OSHA standard, basically any group of personnel "who are expected to perform work to handle and control actual or potential leaks or spills of hazardous substances requiring possible close approach to the substance");
2. Personnel injured due to overexposure from an incident;

3. Personnel who are or may be exposed to hazardous substances or health hazards at or above the OSHA permissible exposure limits (PELs) or above other published exposure levels if no PEL exists for 30 days or more a year (exposure is assessed without regarding use of respirators as a mitigating control); and
4. All response personnel wearing respirators for 30 days or more a year.

Sanitation Requirements

Potable water. An adequate supply of potable water, or other drinking fluids, shall be maintained at all times. Containers for drinking fluids should close tightly and be equipped with a tap. These containers must be labeled so they are not accidentally used for other purposes. Where single service cups are supplied, the unused cups shall be maintained in a sanitary container; and a separate disposal container provided for used cups.

Non-potable water. Water intended for uses other than drinking or washing should be labeled as it is not accidentally used for drinking, washing, or cooking. There shall be no cross-connection of potable and non-potable water supplies.

Toilet facilities. Toilet facilities should be provided as follows (29 CFR 1910.120(n):

- 20 or fewer people: 1 facility
- 20-200 people: 1 toilet seat, and
- 1 urinal per 40 persons
- more than 200 people: 1 toilet seat, and
- 1 urinal per 50 persons

Toilets shall be provided such that they are readily accessible from all work areas. Mobile crews with ready access to toilet facilities using their own transportation do not need to have toilet facilities located at their temporary work sites.

Sewage shall be handled in accordance with local health codes using one of the following means:

- sanitary sewer,
- chemical toilets,
- recirculating toilets,
- combustion toilets, or
- flush toilets.

Food handling shall be conducted in accordance with the requirements of local jurisdiction.

Washing Facilities. Washing facilities shall be readily accessible by all employees. In addition to sanitary cleaning, these facilities shall be equipped to remove oily residues from the skin. Washing facilities shall be maintained free of contaminants above exposure limits.

Showers. For operations lasting more than 6 months, showers and changing rooms must be provided in accordance with 29 CFR 1910.120(n)(7);.141(d)(3);(e)

SAFE WORK PRACTICES

Cold Weather

Frostbite and hypothermia are major hazards of working in cold temperatures. A cold environment can reduce the temperature of the body and cause shivering, reduced mental alertness, and even loss of consciousness. However, a healthy worker who is properly protected and takes reasonable precautions can function efficiently and safely in cold environments.

Factors Affecting Cold Exposures:

- exposure to humidity and high winds,
- contact with moisture or metal,
- inadequate clothing, age, and general health.

Physical conditions that worsen the effects include:

- fatigue, allergies, vascular disease, smoking, drinking, and
- certain specific drugs or medicines.

Important Warnings:

- Pain in the extremities may be the first warning of dangerous exposure to cold.
- Severe shivering must be taken as a sign of danger requiring removal from the cold exposure.

A worker should go immediately to a warming shelter if any of the following symptoms occur:

- pain in the extremities,
- onset of heavy shivering,
- excessive fatigue, drowsiness, or
- euphoria.

Hypothermia: Hypothermia is an abnormally low body temperature caused by exposure to cold in air or in water. Hypothermia results as the body looses heat faster than it can produce it. Air temperature alone is not enough to judge the cold hazard of a particular environment. Hypothermia cases often develop in air temperatures between 30-50 degrees Fahrenheit. When you figure in such factors as wind chill, the effective temperature can be significantly lower.

Early warnings of hypothermia are:

- uncontrollable shivering and the sensation of cold;
- the heartbeat slows and sometimes becomes irregular, the pulse weakens, and the blood pressure changes;
- fits of shivering, vague or slurred speech, memory lapses, incoherence, or drowsiness are some symptoms which may occur; and

- other symptoms which may be seen before unconsciousness are cool skin, slow, irregular breathing, low blood pressure, apparent exhaustion, and inability to get up after a rest.

First aid for hypothermia: The main objective in handling potential cases of hypothermia is rewarming the body core evenly and without delay. HOWEVER, doing it TOO RAPIDLY can disrupt body functions such as circulation. Follow these guidelines:

- The outer layer of clothing should be removed when entering a warm shelter.
- The remaining clothing should be loosened to permit sweat to evaporate.
- Alcohol should not be consumed while in the warm environment.
- Anyone on medications such as blood pressure control or water pills should consult a physician about possible side effects of cold stress.

If medical help is not immediately available:

- Keep the person quiet, but keep them awake, if possible.
- Avoid unnecessary movement. If it's necessary to move a hypothermia victim, use a litter the exertion of walking could aggravate circulation problems.
- In case of mild hypothermia where the person is conscious, the body may be packed with heat packs or warm towels at the neck, groin, and armpits.
- As the extremities begin to recover warmth give conscious victims sweet, warm drinks. AVOID caffeine or alcoholic drinks.
- Don't re-warm the core and the extremities at the same time. The sudden return of the cool blood pooled in the extremities to the heart can cause shock.

Water Immersion Victims. Flotation is the most important factor in water immersion survival, but may not be available if not provided in advance.

How to Prevent Cold Stress Injuries:

- Wear the proper clothing to protect yourself
- Provide windbreaks & shelters.
- Schedule coldest work for the warmest part of the day.
- Move work to warmer areas whenever possible.
- Assign extra workers to highly demanding tasks.
- Relief workers available for workers needing a break
- Enforce the BUDDY SYSTEM.
- Minimize sitting/standing still for long periods.
- Older workers need to be extra careful in the cold.
- Sufficient sleep and good nutrition are important for maintaining a high level of tolerance to cold.
- Provide appropriate PROTECTIVE CLOTHING/EQUIPMENT.
- PRIORITY CLOTHING includes protection of FEET, HANDS, HEAD, and FACE. Keeping the head covered important because as much as 40% of body heat can be lost when the head is exposed.

Equipment and Clothing where there is the possibility of falling onto the water.

Flotation (personal or throwing devices)

Air trapped between layers of clothing will provide buoyancy and heat insulation, but personal Floatation Devices (PFDs) offer the best chance for survival in cold water.

Type III PFDs include float coats and mustang suits which provide floatation and thermal protection.

SAFE WORK PRACTICE - HOT WEATHER

Heat Stroke. Heat stroke is the most serious of health problems associated with working in hot environments. It occurs when the body's temperature regulatory system fails and sweating becomes inadequate.

A heat stroke victim's skin is hot, usually dry, red or spotted. Body temperature is usually 105 degrees F or higher, and the victim is mentally confused, delirious, perhaps in convulsions, or unconscious.

Any person with signs/symptoms of heat stroke requires immediate first aid or hospitalization. This includes removing the victim to a cool area, thoroughly soaking the clothing with water, and vigorously fanning the body to increase cooling.

Heat Exhaustion. Heat exhaustion symptoms may resemble the early symptoms of heat stroke. Heat exhaustion is caused by the loss of large amounts of fluid by sweating, sometimes with excessive loss of salt. Those suffering from heat exhaustion still sweat but experiences extreme weakness or fatigue, giddiness, nausea, or headache. In more serious cases, the victim may vomit or lose consciousness. The skin is clammy and moist, the complexion is pale or flushed and the body temperature is normal or only slightly elevated.

In most cases, treatment involves having the victim rest in a cool place and drink plenty of liquids. Victims with mild cases of heat exhaustion usually recover quickly with this treatment.

Fainting. A worker who is not accustomed to hot environments and who stands erect and immobile in the heat is susceptible to fainting. With enlarged blood vessels in the skin and in the lower part of the body due to the body's attempts to control internal temperature, blood may pool there rather than return to the heart to be pumped to the brain. By moving around, and thereby preventing blood from pooling, the patient can prevent further fainting.

Heat Rash. Heat rash, also known as prickly heat, is likely to occur in hot, humid environments where heat is not easily removed from the surface of the skin by evaporation and the skin remains wet most of the time. The sweat ducts become plugged, and a skin rash soon appears. When the rash is extensive or when it is complicated by infection, prickly heat can be very uncomfortable. The worker can prevent this condition by resting in a cool place part of each day and by regularly bathing and drying the skin.

Preparing For Work in the Heat

Gradual exposure to heat gives the body time to become accustomed to higher environmental temperatures. Heat disorders in general are more likely to occur among

workers who are not adjusted to working in the heat or among workers who have been away from hot environments.

The amount of heat produced during hard, steady work is much higher than that produced during intermittent or light work.

Rest Areas. Resting in cool, shaded areas can considerably reduce the stress of working in a hot environment.

Drinking Water. In the course of a day's work in the heat, a worker may produce as much as 2 to 3 gallons of sweat. It is essential that water intake during the workday be about equal to the amount of sweat produced. Most workers exposed to hot conditions drink less fluids than needed. Don’t depend on thirst to signal when and how much to drink. Instead, drink 5 to 7 ounces of fluids every 15 to 20 minutes to replenish the necessary fluids in the body. There is no optimum temperature of drinking water, but most people tend to drink cool fluids. Individual drinking cups should be provided--never use a common drinking cup.

SAFE WORK PRACTICE: MANUAL LIFTING

Lifting and moving objects such as drums, boxes and bags of debris are a routine part of work. However, incorrect lifting and moving of objects can cause serious injury to the lower back. Below are some helpful suggestions to avoid injury while lifting or moving objects.

Use available machinery and lifting equipment before lifting heavy loads manually.

Have someone help you with a heavy load (even a load within personal capacity can cause back injury). Use team work for numerous small loads (e.g., stock piles of trash bags full of debris).

Use of Chemical Protective Equipment will restrict movement and visibility. Use extra care while lifting in this equipment.

Position feet properly. It is important to maintain balance and avoid twisting motions while lifting. Feet should not be close together. The feet should be close to the load to help keep the body close to the center of gravity. One foot should be positioned in the direction the load will be moved to avoid twisting or turning of the back during the lift. Turn using your feet and not by twisting the back.

Before and during the lift pull the load close to you to keep the center of gravity over your feet.

Check your grip and test the weight of the load before lifting.

The back should be straight when starting the lift and the knees should be doing the bending. This will help to ensure that much of the lifting is done with the legs. To help keep the back straight the chin should be tucked in and head kept up.

Keep the stomach muscles tight while lifting. Keep your back straight during the lift and avoid twisting motions in particular.

Move slowly and deliberately.

SAFE WORK PRACTICE: HELICOPTERS

Basic Safe Work Practices for All Passengers/Ground Crews:

Passengers should receive a safety briefing from helicopter operators including safety features and equipment, their location on the individual aircraft and water landing procedures, when appropriate.

Passengers or ground crew members approaching helicopters shall stay in a crouched position, and shall be in clear view of the pilot while approaching or departing a helicopter.

Passengers and ground crew should approach/depart from the FRONT of the helicopter ONLY when signaled by the pilot; and should NEVER walk under or around the tail.

Loose fitting clothing, hats, hard hats, or other gear, which might be caught in rotor down wash must be secured or removed within 100 feet of operating helicopters.

Passengers shall maintain a distance of 50 feet from helicopters while rotors are turning. Ground crew should also maintain this distance unless specific work practices are developed for closer work.

Passengers shall wear seat belts at all times.

Passengers and ground crew shall wear hearing protection (including communications headsets, or helmets) at all times around operating helicopters.

Passengers shall generally assist the pilot in watching for other traffic or ground obstacles as directed by the pilot.

During emergency landings in water:

Do not exit until rotor blades stop turning or pilot signals all clear.

Do not inflate life preservers until outside of the helicopter.

SAFE WORK PRACTICE: BOAT OPERATIONS

Boat operators should familiarize themselves, and passengers with safety features and equipment on their boats. Boats are to be operated only by qualified personnel.

Life jackets, work vests, mustang suits, or other appropriate Coast Guard approved Personal Flotation Devices (PFDs) should be worn by personnel in small boats. Exposure suits are particularly critical in extremely cold conditions.

Types of Personal Flotation Devices (PFDs)

TYPE I Off-shore life jacket provides the most buoyancy. It is effective for all waters and intended specifically for open, rough or remote waters where rescue may be delayed.

Type II Near-shore buoyancy vests are intended for calm, inland water or where there is a good chance of quick rescue.

Type III Flotation aids are good for calm, inland water, or where there is a good chance of quick rescue. Examples: float coats, fishing vests, and ski vests.

Type IV These are throwable devices, not intended to be worn or to replace those that are worn.

Type V (Special Use) These are intended for specific activities (according to the conditions on the labels). Some examples: deck suits, mustang suits, work vests, and hybrid PFDs below.

Type V (Hybrid Inflatables). These PFDs contain a small amount of inherent buoyancy and an inflatable chamber.

Small boats should generally not be operated for after sunset. If this is required and poses minimal risk, routes of operations, communication requirements should be carefully prescribed. Each boat will be fully equipped with appropriate running lights and emergency signaling devices.

Distress signals (three or more for day and three or more for night) should be carried on board all vessels.

Boat operators must keep their supervisors informed of their area of operations.

Boat operators should never anchor their boats by the stern. This is typically the lowest point on the boat due to design and/or loading, and is often squared off making it vulnerable to swamping.

Portable fuel tanks should be filled outside of the boat. All sources of ignition in the area of fueling (e.g., engines, stoves or heat producing equipment, and electrical equipment) should be secured while fueling.

Strict adherence to the buddy system must be observed in small boats; and all boats should be in direct visual or radio contact with a shore base at all times.

To avoid slipping on wet decks or falling in small boats, personnel should remain seated while boat is underway. Horseplay and speeding is strictly prohibited. Boat operators must also ensure that boats are not overloaded.

Boat shoes, safety sunglasses and hearing protection should be worn by personnel working in or operating small boats where appropriate.

Depending on the specific nature of the operations (e.g., work in remote areas), other emergency equipment which should be considered such as: anchors, radios, bailers, first aid kits, and additional means of propulsion (e.g., paddles).

Boat personnel are cautioned not to use their legs as fenders, or get their hands, arms, or legs between vessels or between vessels and docks.

SAFE WORK PRACTICE: DRUM HANDLING

Handling Drums.

A specific work plan has been developed for handling storage of drums or containers. The plan outlines the appropriate PPE.

- Drums shall be inspected and properly labeled.
- Movement of drums must be kept to a minimum.
- Whenever possible, drums shall not be moved manually.
- Prior to shipment, each drum must be in good condition (or over-packed) and properly labeled in accordance with DOT requirements.
- A log shall be maintained to track sampling, re-packing/over-packing, bulking/consolidation, on-site movement, off -site shipment of each drum.

Opening and sampling drums.

When opening drums, minimize number of employees in the work area.

When drums are moved from their original locations to a work area or staging area, a spill containment area must be constructed for those locations. The containment should be able to contain the maximum loss from any of the containers in the area.

Safe access and egress points must be provided to all staging areas. Adequate room and ramps must be provided for heavy equipment used to handle drums. A secondary emergency egress point must also be identified.

SAFE WORK PRACTICE: DRIVING AND VEHICLES

One of the most dangerous operations performed by personnel is driving to and from the site. This is particularly true when driving unfamiliar vehicles.

Familiarize yourself with your vehicle before driving. Walk around and check the outside condition, familiarize yourself with the interior, and make all adjustments before driving a vehicle. Check for these:

_____ signs of accident damage:
_____ tires inflated, in good condition, changing equipment
_____ gas cap is in place
_____ hood and trunk secured
_____ locate emergency kit
_____ check exterior lights - function properly
_____ headlights (dim)
_____ headlights (bright)
_____ parking lights
_____ emergency flashers (front and rear)
_____ turn signals (front and rear)
_____ brake lights
_____ side/rear mirrors adjusted and in good condition
_____ horn works properly
_____ seat belts are in good condition
_____ locate your sunglasses
_____ locate the headlight switch/dimmer
_____ locate the windshield wiper switch
___ heating and air conditioning switches
_____ check gauges

DRIVE CAREFULLY!

GET YOUR ATTITUDE RIGHT before driving!

Remember no reckless driving.

Forget schedules while driving! The road is no place to make up lost time.

SETTLE DOWN! Do not bring frustrations into the vehicle with you.

Make up your mind to be the most courteous driver on the road. Forget about getting even with bad drivers on the road. Forget about competing with other drivers.

Expect other drivers to make stupid mistakes, and prepare to deal with their mistakes. Expect the other drivers to break the rules.

Use your headlights during all conditions of reduced visibility (dawn, dusk, fog).

Do not drive under the influence of alcohol or drugs. Only time will make you sober.

Look ahead for problems and maintain a safe distance behind the car in front of you.

Slow and steady is the best pace for driving on snow, ice, or other slippery road surfaces. Do not hit your brakes hard or accelerate quickly.

SAFE WORK PRACTICE: HANDLING OILED WILDLIFE

Handling of Birds. Handling of birds must be done properly to ensure the protection of BOTH bird and handler. Wild birds have no way of knowing or understanding human intentions. Even a greatly weakened bird can inflict serious injury to handlers. Eyes are a particular concern. Open wounds on hands and arms present access for oily contaminants and disease vectors to enter the human blood system.

Contact With Oil. The site safety plan will provide a more detailed discussion of health hazards of oils.

The primary health hazard associated with oils (crude oil in particular) is dermatitis from skin contact. This condition may be aggravated for personnel conducting washing operations. Prolonged exposure to soapy water initiates defatting of the skin, and water logging may contribute to an initial skin injury that can aggravate sensitivity to the oil. Once an individual contracts an allergic dermatitis reaction it will be nearly impossible to prevent future outbreaks other than by strict avoidance of any further contact with the oil.

Oils splashed in the eyes will also cause acute irritation and perhaps inflammation.

Injuries inflicted by birds open a path for the chemical components of oils to enter the blood.
The smell of crude oil or diesels may be irritating to sensitive individuals and can cause nausea even at otherwise nontoxic concentration.

Personal Protective Equipment (PPE) for working in REHAB centers:

- Dress adequately and bring a change of clothing.
- Dress adequately for the cold in particular.
- Bring a rain suit if there is any chance of working outside in the rain.
- Bring a change of work clothing if you will be working with oil or contaminated water.
- Use aprons, rain slickers & pants, boots or boot covers, and gloves that are resistant to oils (neoprene is a common material that is resistant to many oils).
- Wear heavy long sleeved garments for protection from bird bites. Bites may become infected and must be properly cleaned and treated.
- Wear glasses or goggles (for beak and splash protection) while handling or cleaning oily birds.

Immunization.

Personnel working in the field or handling birds in centers should have an up-to-date tetanus immunization.

Rabies prophylaxis should be considered for personnel handling wild animals, AND ESPECIALLY if field personnel are bitten by wild animals.

Handling Birds. Never handle birds unless trained in handling procedures

SAFE WORK PRACTICES:
GENERAL PERSONAL PROTECTIVE EQUIPMENT

Hearing Protection

A noise level of 90 decibels (dBa) or greater is known to be a long term hazard to anyone who is not wearing hearing protection; OSHA has also established 85 dBa as an "Action Level" because some people may suffer long term effects from exposure to that level. Hearing protection devices are available, and should be worn.

Hearing Protection Devices:

Expandable Foam Earplugs

The expandable foam earplugs come with or without a cord attached to the plugs. To use roll the plug into a narrow cylinder, insert them all the way into the ear canal, these plugs work by expanding to take on the shape and size of the ear canal.
These plugs are considered disposable, and must be discarded after a daily or single usage, in order to avoid the possibility of infection from accumulated dirt and/or germs.

Sized Rubber Earplugs

These come in a variety of sizes to accommodate most ear canals. These plugs are not considered disposable, and should be cared for and kept clean and free from potential infection. They should be washed with mild soap and water after each usage, and stored in a clean area.

Earmuffs

Earmuffs are also not considered disposable, and should be cared for and kept clean in the same manner as rubber earplugs. It must be noted that the full benefit of wearing earmuffs cannot be obtained while wearing glasses, because the temple pieces on the glasses interfere with the sealing surface on the ear.

Noise Reduction Ratings are assigned to all pieces of hearing protection. Earplugs and earmuffs are assigned Noise Reduction Ratings anywhere from 20 to 35 decibels, meaning that if worn properly, that device will reduce the noise level that many decibels.

HEAD PROTECTION

Head injuries are caused by falling or flying objects, or by bumping the head against a fixed object. The general rule is hard hats are required unless otherwise specified by the Safety Officer.

For maximum protection hard hats are designed to be worn straight on the head with the peak forward. The shell and suspension have been engineered and constructed of materials to provide maximum protection – *do not alter the shell or suspension system.*

FACE and EYE PROTECTION

The general rule is face and eye protection is required unless otherwise specified by the Safety Officer.

The minimum acceptable eye protection is safety glasses with side shields that comply with ANSI Standard Z87.1.

Ordinary personal prescription glasses and commercial safety glasses do not meet this standard and are not permitted. Safety eyewear must be worn in all work areas. Contact lenses do not constitute eye protection.

Goggles and face shields are required for work that could generate excessive particles or present the possibility of a liquid/chemical splash. Face shields add to the protection of the face and eye area and are to be worn with goggles and/or safety glasses.

SAFE WORK PRACTICES: GENERAL PERSONAL PROTECTIVE EQUIPMENT

HAND PROTECTION

The potential for hand injury comes from contact with sharp objects, pinch-points, force, impact; hand burns from contact with high temperatures, with acidic or caustic materials; or other reaction-types of injury from chemicals in general.

No one type of glove protects against all hazards. Some work may require only general purpose leather work glove, while other work may require a variety of gloves for the potential hand hazards they may encounter. Whatever the application gloves should be worn continuously. The only exception would be if a certain activity would be more hazardous with gloves on (such as working around rotating equipment - lathes, etc.).

Handling Objects & Materials

Before grasping objects, inspect them for sharp edges, nails, splinters, metal particles, burrs, or rough surfaces. Do not slide hands along edges of object to grasp them.

Do not use your hands to do the work that vises and clamps are meant to do; and do not use your hands to guide work through table saws - use pusher sticks.

Always keep guards in place on tools and machinery, and keep hands away from moving, rotating, and cutting parts. Avoid wearing rings and jewelry that can be caught in equipment.

Always cut away from the body when using knives, and keep the opposite hand clear of the knife's path.

When removing metal shavings or chips, use a brush, because some of these particles can cut right through gloves.

Always make sure electrically driven equipment is not only shut off at the switch, but shut off and locked out and tagged at the breaker before beginning to do any work on such equipment

Never use compressed air to remove dirt from the hands or body.

FOOT PROTECTION

There is potential for injury in dropping or mishandling loads that are being lifted, carried, or pushed or pulled manually. Other risks are from falling objects, mobile equipment, walking into objects, or from hydraulic equipment.

Foot protection, such as steel toed work shoes can help to minimize the severity and frequency of foot and toe injuries.

Personnel in work areas must wear foot protection consisting of a shoe with a sturdy leather or leather-like upper and an oil resistant sole. Soft leather uppers or soft-toed uppers are not allowed. Shoes must be fully enclosed (no open toes or heels) and resistant to the hazards encountered (i.e., acids caustics, slippery surfaces, etc.). When climbing ladders, stairs, etc. the shoes should have a heel to prevent slippage.

Steel-toed work shoes are not required but are strongly recommended.

Office personnel may wear non-work shoes while in office areas. However, appropriate work shoes must be worn when going out into field locations.

Sneakers or causal shoes are not allowed in work areas.

Additional foot protection may be required for specific work such as working on boats or around spilled material the safety plan will outline the specific protective equipment for specific types of work.

SAFE WORK PRACTICES: General First Aid

Individuals providing first aid care should note that it is possible to be exposed to infectious diseases due to contact with injured people who may be infectious, or contaminated objects during the course of performing first aid duties. Examples of such infectious diseases are Hepatitis B virus (HBV) and human immunodeficiency virus (HIV). Proper personal protective equipment is a must to prevent exposure.

Individuals who may have or suspect they may have been exposed should report the incident immediately. Immediately following a report of an exposure incident a confidential medical evaluation and follow-up conducted.

The *primary* goal is to stop/reduce the bleeding, treat for traumatic shock, and obtain medical care promptly. To accomplish this:

- Apply direct pressure with a clean cloth pad, or place hand firmly over the wound.
- When possible, clean the wound with soap and water and remove all foreign matter.
- Maintain pressure until bleeding stops or lessens.
- Apply additional cloth pads and bind firmly in place. Do not use rope or wire for this purpose.
- Keep the patient lying down, insulated from cold surfaces, but don't induce sweating. If thirsty, give water if there is no evidence of internal bleeding or if not semi-conscious.
- If severe bleeding can not be controlled by direct pressure, arterial pressure should be used.
- When there is bleeding from the mouth, nose, or ears, there may be serious internal wounds.Keep patient lying down and warm (not the point he may sweat). Raise his head if his breathing is difficult. Make sure his mouth and nose are clear of all matter.

A fracture is a break in any bone in the body. These are the various types of fractures:

- Simple fracture is a break that is confined inside the flesh without protrusion of a broken end through the skin.
- Compound fracture is associated with an open wound of the skin.
- A dislocation occurs when a movable bone is displaced from its joint.
- Sprains are injuries to ligaments and tendons that result from abnormal stretching of these tissues at a bone joint.

First Aid Measures

Call for help immediately. Control bleeding and immobilize the fractured area. Always suspect head or spinal injury where there have been severe blows to the head or back from falls or other causes. A person with a possible upper or lower spine fracture must not be moved unless it is absolutely necessary. Do not attempt to reposition any dislocated joint.

Sprains are common. Symptoms are swelling, tenderness, and painful motion. There also may be large discolored areas. Some symptoms resemble those for fractures, knowing the cause of the injury is of help in deciding how to treat.

If there is a possibility of a fracture, immobilize the body part. Otherwise, apply cold water or an ice pack. Do not walk on a badly sprained ankle without proper support. Leave the shoe on but with laces loosened on high-cut shoes.

DAILY SAFETY MESSAGES

Site Description: On-Water & Shoreline Cleanup Activities

Potential Hazards: Slippery and uneven surfaces; exposure to weathered oil; cold/heat exposure; slips, trips, and falls; and boat operations

General Safety Concerns:

ADHERENCE TO ALL PPE REQUIREMENTS

Level D (no known hazard(s))

- **Tyvek-type and /or rain gear.**
- **Hard hat when overhead hazards exist**
- **Safety glasses/goggles/face shield**
- **Work shoes**
- **Disposable boots**
- **Chemical resistant gloves**
- **Hearing protection**

NOTE: Eye Protection is NOT OPTIONAL. ANSI Approved Safety Eye Wear with Side Shields is the minimum eye protection requirement for all activities.

Personal Flotation Equipment (PFDs) are required to be worn properly—fully secured—when working on or near the waters edge. UNSECURED PFDs MEANS NO PFDs!

Gloves and sleeve area and boot and pant leg area should be taped to prevent contact with product.

Use of tobacco products of any kind and eating/drinking is restricted to designated areas only and only following proper personal decon-tamination. Contractors should clearly designate break/rest areas. Otherwise such activity is prohibited.

Special notes –

SPECIAL CAUTION:
STAY CLEAR OF DIVING OPERATIONS BY AT LEAST 200 YDS. THIS WILL BE STRICTLY ENFORCED!

- **In the event clean up activities involve entry to industrial/commercial facilities, safety rules of the facility will apply as long as the safety rules do not contradict this Plan.**
- **ALL INJURIES REGARDLESS OF SEVERITY MUST BE REPORTED TO THE OPERATIONS CENTER AND SAFETY IMMEDIATELY AND A INCIDENT REPORT MUST BE FORWARDED VIA THE FIELD SAFETY REPRESENTATIVE**
- **In the event of a non-life threatening emergency the patient should, if possible, be transported out of the hot zone and decontaminated as much as possible. In life threatening emergencies, where a patient cannot be moved, medical**

personnel will respond into the hot zone properly attired. A second ambulance will be dispatched to transport.

- **ALL PERSONNEL VISITING THE HOT ZONE MUST BE WEARING THE APPROPRIATE PPE.**

Medical Emergency Triage and Evacuation Procedure

Medical Aid is available at the following locations:

Staging Area 3 (The Lagoon)
Paramedics Contact Number: 610-636-8324

In the event of an injury or illness requiring medical attention the following guidelines should be followed:

Non-Life-Threatening

The Field Operations Supervisor should relieve the person from duty and, as possible, conduct personnel decontamination in preparation for medical attention. The person requiring medical attention should be transported immediately to the Medical Aid Station at Hogg Island on the Pennsylvania side or the Miller Staging area on the New Jersey side of the river.

A radio call should be made to Medical 1 (Hogg Island) or Medical 2 (Miller Staging) to let the medical personnel know a patient is in route.

Life Threatening

In the event of a life threatening emergency, the closest Medical Station should be notified immediately and asked to respond to the scene. Be prepared to describe the medical emergency and all actions that have been taken to treat the condition on site.

Medical Station personnel will call 911 immediately and provide the emergency dispatcher with the patient information.

Coordination by the Field Supervisor, Field Safety Representative, and Medical personnel is important to ensure effective transportation and response

Notifications

Notification should be made to the Field Safety Representative or the Safety Officer (Ed Doyle, 302-293-8959 or Archie Gresham, 302-293-8960).

SAFE USE OF PRESSURE WASHERS AND STEAM CLEANERS

Work to Be Done: Removal of contaminants from equipment, shoreline, piers, and similar structures.

Equipment: Steam cleaners, and pressure washers powered by internal combustion engines.

Site Description: Various types of work surfaces, rocks, sand, oily surfaces.

Potential Hazards: Slips, trips, falls, steam burns, injuries from excess pressure, excessive noise, injuries from hot surfaces on the hotsy or pressure washers, insect and animal bites, and potential drowning.

Special notes: All personnel should adhere to the following precautions with steam cleaners and pressure washers:

- All personnel will wear proper personal protective equipment when working operating the steam or pressure wands or assisting personnel using this equipment. This will include Tyvek coveralls, rubber boots, nitrile or neoprene gloves, **face shield with clear or tinted safety glasses with side shields under the shield**.
- All personnel working around pressure washers or steam cleaners must, at a minimum, wear regular safety glasses.
- **Equipment operators should never direct the power spray of the wand to themselves or other personnel.** Steam washers are for decontamination of equipment only. Personal Protective Equipment should not be washed or decontaminated by using steam or power washers.
- Prior to starting the equipment caution should be exercised when filling the tank with gasoline. No smoking will be allowed in the area while equipment is being refueled. Prior to startup all hoses and wand should be connected and rechecked to ensure the connections are secure.
- All supply and wand hoses should be free of kinks and where possible secured to not present a tripping hazard to other personnel.
- Operators should be cautious when using the rope pull to start the engine. Wet hands, slippery hands, pulls or frayed pull rope can lead to injury.
- Operators should ensure that personnel in the area are a safe distance from the wand and equipment operations.
- Noise surveys should be taken to check noise exposure to workers. Generally personnel working on or within 5 feet of steam or pressure should wear hearing protection.
- When working near water, Personal Flotation Devices (PFD's) must be worn.
- Contaminated areas, where personnel are working, should be marked and barricaded, and the surface

covered to prevent spread of contamination. NOTE: If plastic is used for coverage of the surfaces, personnel must exercise care when walking on the plastic surfaces as they can become slick with a combination of contaminant and water. The wearing of rubber oil resistant non-skid boots or the use of cloth covering on the surface instead of plastic is preferable.

- Wand levers should always be held and triggered by the operator's hand. At no time should the lever be wired or taped in the open position.

ATV Safety Practices

Operating ATV's can be hazardous if safety practices are not followed:

- Wear proper protective clothing. This includes an approved helmet, gloves, eye protection, a long-sleeved shirt, and long pants.
- Inspect the ATV before you begin.
- Be aware of potential hazards/obstructions that may be present in the area where you are operating.
- DO NOT carry passengers.
- Be aware of your surroundings.
- Watch out for other personnel and equipment.

Handling characteristics of ATVs vary depending upon basic design and how they are equipped.

ATVs with solid rear axles (and those with locked differentials) turn both rear wheels at the same speed. ATVs with unlocked differentials allow the rear wheels to turn at different speeds. If a rear wheel leaves the ground, it will spin freely. Then when it touches the ground again, it may grab and cause loss of control.

Some ATVs are equipped with four-wheel drive. When operating in a four-wheel drive mode, keep the following in mind:

- Use of only the front brake or only the rear brake has the effect of braking both the front and rear wheels.
- Abrupt deceleration from shifting to a lower gear (engine braking) will affect both the front and rear wheels.

Posture

The correct riding posture will help you to easily operate the controls and help you react more quickly to potential hazards. Proper straight line riding posture includes:

- Head and eyes up, looking well ahead
- Shoulders relaxed, elbows bent slightly out, away from your body
- Hands on the handlebars
- Knees in toward the gas tank
- Feet on the footrests, toes pointing straight ahead
- Always keep both hands on the handlebars and both feet on the footrests. Removing even one hand or foot can reduce your ability to control the ATV, or could cause you to lose your balance and fall off. ATVs are rider-active—to enhance the performance capabilities of the ATV in maneuvers such as turning, negotiating hills, and crossing obstacles, you must shift your body weight.

VESSEL SAFETY

The operator is responsible for the safety of the crew and vessel at all times. The vessel shall never be operated in a manner that threatens safety of the crew or vessel. The operator is to ensure that ALL personnel aboard the vessel are wearing lifejackets AT ALL TIMES! Under no circumstances are personnel to enter the water while the vessel is underway or the vessel's engine(s) is(are) running.

It is the operators' responsibility to ensure the vessel is seaworthy and in safe operating condition prior to leaving shore. The operator will inspect the vessel and determine that all required operational and safety equipment is on board and in proper working condition.

The operator is responsible for safe transport, launch, operation, and recovery of the vessel.

In the event of a boating accident, the operator is the primary person responsible for the vessel and crew. If vessel or crew is in imminent danger, the operator should contact the US Coast Guard immediately.

Ensure vessels are not overloaded with personnel or equipment, and consult vessel capacity according to the boat plate or sticker.

All vessels will carry on board an air horn to be available for emergency sound signaling.

USE THE RIGHT VESSEL FOR THE RIGHT JOB!

Stop Vessel Operations Criteria (Weather)

Vessels will cease operations when any of the following occur:

1. Visible lightning strike
2. 25 knot winds
3. Sea state:

>60' vessels: 6'	30'-60' vessels: 5'	20'-30' vessels: 4'	<20' vessels: 3'

4. Whenever the Safety Officer or one of his assistants deems operations too hazardous to continue.
5. Whenever the vessel operator deems it too hazardous to continue operations.

Vessel operators and response supervisors need not wait for a Safety Officer to deem operations too dangerous. If you feel that the conditions are too hazardous to safely operate in, discontinue operations, notify your supervisor, and then notify the Safety Officer. You may be the first responder to experience hazardous conditions, and your input to the Safety Officer may provide a valuable heads-up to the rest of the command.

Nighttime vessel operations and restrictions

All vessels with lengths of 20 feet or less are required to be safely moored/recovered prior to sunset.

Flat-bottom, “john boat” style boats are not permitted to operate at night and should be safely moored/recovered prior to sunset.

All vessels not specifically restricted from nighttime ops, as detailed above, may only operate after sunset with the proper use of navigation lights as required by Chapter I of the Navigation Rules.

Personal Protective Equipment (PPE) requirements:

All responders working on or near the water must wear a Personal Floatation Device (PFD).

Responders performing the following operations must wear “Mustang” exposure suits:

- Waterborne SCAT teams
- Boom tending and placement teams
- Waterborne vessel decon teams
- Waterborne wildlife recovery teams
- Permanent boat drivers/crew

Crews of vessels equipped with enclosed, heated cabins, where the crew will primarily remain, are excluded from the exposure suit requirement.

Requests for deviation from the above requirements should be directed to the Site Safety Officer, Ed Doyle (302) 293-8959.

Gasoline Safety

Gasoline is a flammable liquid and should be stored at room temperature, away from potential ignition sources such as sparks and flames, space heater, and any other ignition sources. Gasoline vapors are heavier than air and can travel along the ground to an ignition source.

Refueling Advisory

Be aware that fire incidents involving refueling are not unusual. Many of these incidents may be related to static electricity buildup and discharge.

Safety guidelines on filling containers:

- Do not smoke while refueling.
- Shut off the engine using the gasoline along with any engines in the immediate vicinity.
- Only store gasoline in containers with approved labels. Never store gasoline in glass or unapproved containers.
- Portable containers must be placed on the ground, and the nozzle must stay in contact with the container when filling, to prevent buildup and discharge of static electricity.
- Fill the container at a slow rate. This will decrease the chance of static ignition buildup and minimize incidents of spillage or splattering.
- Keep your face away from the nozzle or container opening.
- Avoid prolonged breathing of gasoline vapors.
- Never siphon gasoline by mouth. Do not put gasoline in your mouth—gasoline can be harmful or fatal if swallowed. If someone swallows gasoline, do not induce vomiting. Call for medical assistance immediately.
- Keep gasoline away from your eyes and skin, because it may cause irritation. Wear safety glasses while filling tanks.
- Use gasoline only in open areas that get plenty of fresh air.
- Never use gasoline to wash your hands.
- Remove gasoline-soaked clothing immediately.
- Fill container to no more than 95 percent full to allow for expansion.
- Place cap tightly on the container after filling. Do not use containers that do not seal properly.
- When transporting gasoline in a portable container, make sure the container is secure from tipping and sliding.

Commercial Diving Operations

The following are Health and Safety requirements for all commercial diving operations.

Qualifications of dive team:

- Each dive team member shall have the experience or training necessary to perform assigned tasks in a safe and healthful manner.
- Each dive team member shall have experience or training in the following:
  - The use of tools, equipment and systems relevant to assigned tasks;
  - Techniques of the assigned diving mode: and
  - Diving operations and emergency procedures.
- All dive team members shall be trained in cardiopulmonary resuscitation and first aid (American Red Cross standard course or equivalent).
- Dive team members who are exposed to or control the exposure of others to hyperbaric conditions shall be trained in diving-related physics and physiology.
- Each dive team member shall be assigned tasks in accordance with the employee's experience or training, except that limited additional tasks may be assigned to an employee undergoing training provided that these tasks are performed under the direct supervision of an experienced dive team member.
- The employer shall not require a dive team member to be exposed to hyperbaric conditions against the employee's will, except when necessary to complete decompression or treatment procedures.
- The employer shall not permit a dive team member to dive or be otherwise exposed to hyperbaric conditions for the duration of any temporary physical impairment or condition which is known to the employer and is likely to affect adversely the safety or health of a dive team member.
- The employer or an employee designated by the employer shall be at the dive location in charge of all aspects of the diving operation affecting the safety and health of dive team members.
- The designated person-in-charge shall have experience and training in the conduct of the assigned diving operation.

Safe Practices Manual

- The employer shall develop and maintain a safe practices manual which shall be made available at the dive location to each dive team member.
- The safe practices manual shall contain a copy of this standard and the employer's policies for implementing the requirements of this standard.
- For each diving mode engaged in, the safe practices manual shall include:
  - Safety procedures and checklists for diving operations;
  - Assignments and responsibilities of the dive team members;
  - Equipment procedures and checklists; and

- Emergency procedures for fire, equipment failure, adverse environmental conditions, and medical illness and injury.

Pre-dive procedures

- The employer shall comply with the following requirements prior to each diving operation, unless otherwise specified.
- *Emergency aid.* A list shall be kept at the dive location of the telephone or call numbers of the following:
- An operational decompression chamber (if not at the dive location);
  - As per medical plan, a hyperbaric chamber is located at UPENN Hospital (215) 662-3920
  - Accessible hospitals (Listed on ICS form 206 – Medical plan);
  - Available physicians (Listed on ICS form 206 – Medical plan);
  - Available means of transportation; and
  - A first aid kit appropriate for the diving operation
- When used in a decompression chamber or bell, the first aid kit shall be suitable for use under hyperbaric conditions.
- In addition to any other first aid supplies, an American Red Cross standard first aid handbook or equivalent, and a bag-type manual resuscitator with transparent mask and tubing shall be available at the dive location.
- *Planning and assessment.* Planning of a diving operation shall include an assessment of the safety and health aspects of the following:
  - Diving mode;
  - Surface and underwater conditions and hazards;
  - Breathing gas supply (including reserves);
  - Thermal protection;
  - Diving equipment and systems;
  - Dive team assignments and physical fitness of dive team members (including any impairment known to the employer);
  - Repetitive dive designation or residual inert gas status of dive team members;
  - Decompression and treatment procedures (including altitude corrections); and
  - Emergency procedures.
- *Hazardous activities.* To minimize hazards to the dive team, diving operations shall be coordinated with other activities in the vicinity which are likely to interfere with the diving operation.
- Dive team members shall be briefed on:
  - The tasks to be undertaken;
  - Safety procedures for the diving mode;
  - Any unusual hazards or environmental conditions likely to affect the safety of the diving operation; and

- Any modifications to operating procedures necessitated by the specific diving operation.

- Prior to making individual dive team member assignments, the employer shall inquire into the dive team member's current state of physical fitness, and indicate to the dive team member the procedure for reporting physical problems or adverse physiological effects during and after the dive.
- *Equipment inspection.* The breathing gas supply system including reserve breathing gas supplies, masks, helmets, thermal protection, and bell handling mechanism (when appropriate) shall be inspected prior to each dive.
- *Warning signal.* When diving from surfaces other than vessels in areas capable of supporting marine traffic, a rigid replica of the international code flag "A" at least one meter in height shall be displayed at the dive location in a manner which allows all-round visibility, and shall be illuminated during night diving operations.

Record keeping

The employer shall record the occurrence of any diving-related injury or illness which requires any dive team member to be hospitalized for 24 hours or more, specifying the circumstances of the incident and the extent of any injuries or illnesses.

Danger: Medical Waste and Needles

Protect yourself from needle sticks and contact with medical waste while picking up debris from the shoreline area. All types of debris wash up on the shoreline including medical waste such as used hypodermic needles.

Be Cautious while picking up debris.

If you see medical waste such as hypodermic needles notify your supervisor immediately. Use grabbing tools to pick up debris—**do not pick up with your hands**.

If you are stuck by a needle immediately notify your supervisor who will arrange for medical attention.

Why do you need medical attention?

Because needle stick injuries can expose workers to a number of bloodborne pathogens that can cause serious or fatal infections. The pathogens that pose the most serious health risks are:

- Hepatitis B virus (HBV)
- Hepatitis C virus (HCV)
- Human immunodeficiency virus (HIV) -- the virus that causes AIDS

To date only one hypodermic needle has been report along the shoreline. But there is always the possibility of more hypodermic needles and other medical waste.

Be very careful!

Sharps containers and medical waste will be provided in each work area. All sharps like hypodermic needles must be disposed of in sharps containers and medical waste such as used bandages must be disposed of in the appropriate medical waste bag.

Site Specific Hazards

Site Safety Plan Attachment

9709 CG ICS SSP SPECIFIC HAZARD ATTACHMENT	1. Hazard Products containing Benzene Additional Attachments:		2. Divisions/Groups/Units affected:		3. Job Tasks Involving Hazard:	
Medical Condition	Action Level	Reference	Signs, Symptoms & Potential Health Effects	Exposure Route	Controls: Engineering, Administrative, PPE	Medical Response
Cancer			Bone marrow depression, Abnormal blood counts, Cancer of the blood (leukemia), incapacitating illness & death	Inhalation **X** Absorption **X** Ingestion Injection Membrane _____	- Avoid Contact - Avoid confined & tight spaces - Keep upwind - Air monitoring - Chem resistance clothing - Respirators > PEL	- Test blood & urine for phenol
Dermatitis			Reddening of the skin, benzene is a suspected skin carcinogen	Inhalation Absorption **X** Ingestion Injection Membrane _____	- Avoid Contact - Keep upwind - Wear chemical resistance gloves & clothing - Wash frequently	- Wash skin & exposed areas with soap and water
Eye Irritation			Red eye, weeping eye, blurry vision	Inhalation Absorption **X** Ingestion Injection Membrane _____	- Avoid Contact - Keep upwind - Wear safety glasses - High splash zone, wear chemical resistance goggles	- Flush eyes with water
Central Nervous System Effect			Giddiness, headache, nausea, staggered gait, fatigue -	Inhalation **X** Absorption **X** Ingestion Injection Membrane _____	- Avoid contact, & confined/tight spaces - Keep upwind - Air monitoring - Chem resistance clothing Respirators > PEL	- Test blood & urine for phenol
Respiratory Irritant			Irritation of nose, throat and lungs	Inhalation **X** Absorption **X** Ingestion Injection Membrane _____	- Avoid confined & tight spaces - Keep upwind - Air monitoring - Chem resistance clothing Respirators > PEL	- Test blood & urine for phenol
4. Prepared by:	5. Date/time briefed:		**Last Update: 4/25/05**		**SSP-Attach 1: Benzene** **Page ____ of _____**	

CG ICS SSP SPECIFIC HAZARD ATTACHMENT	1. Hazard Products Containing Hydrogen Sulfide Additional Attachments:		2. Divisions/Groups/Units affected:		3. Job Tasks Involving Hazard:	
Medical Condition	Action Level	Reference	Signs, Symptoms & Potential Health Effects	Exposure Route	Controls: Engineering, Administrative, PPE	Medical Response
Chemical asphyxiation	**Note: Poor Warning Properties**		Headache, dizziness, fatigue, staggered gait, giddiness	Inhalation **X** Absorption Ingestion Injection Membrane _____	- Avoid Contact - Avoid confined & tight spaces - Keep upwind - Air monitoring - SCBA > PEL	
Diarrhea			Runny or loose stool	Inhalation **X** Absorption Ingestion **X** Injection Membrane _____	- Avoid Contact - Keep upwind - Wash frequently - Avoid confined & tight spaces - Keep upwind - Air monitoring - SCBA > PEL	- If ingested, induce vomiting, drink large volumes of water
Respiratory Paralysis			Difficulty breathing, fatigue, strong signs of weakness	Inhalation **X** Absorption Ingestion Injection Membrane _____	- Avoid Contact - Keep upwind - Wash frequently - Avoid confined & tight spaces - Keep upwind - Air monitoring - SCBA > PEL	- Provide support respiration where needed
Chemical Burns			Severe burning of skin, eyes and other external organs -	Inhalation Absorption Ingestion Injection Membrane Contact **X**	- Avoid areas above 10% LEL - Keep upwind - Air monitoring - Flash protective clothing SCBAs > PEL	-Treat for burns as appropriate
Central Nervous System Depression			Headache, dizziness, fatigue, staggered gait, giddiness	Inhalation **X** Absorption Ingestion Injection Membrane _____	- Avoid confined & tight spaces - Keep upwind - Air monitoring - Chem resistance clothing SCBA > PEL	- Remove from site
4. Prepared by:	5. Date/time briefed:		**Last Update: 4/25/05**		**SSP-Attach 2: Hydrogen Sulfide Page ____ of _____**	

CG ICS SSP SPECIFIC HAZARD ATTACHMENT	1. Hazard Generic Signs & Symptoms of Toxic Exposure Attachments:	2. Divisions/Groups/Units affected:	3. Job Tasks Involving Hazard:

Signs and Symptoms	Action to be Taken
- Sudden weight loss or change in appetite. - Unusual fatigue or sleeping difficulties - Unusual irritability - Skin rashes/allergies/sores - Hearing loss - Vision loss or problems - Changes in sense of smell - Shortness of breath, asthma, cough, wheeze, excess sputum - Chest pains - Nausea, vomiting, dizziness - Weakness, tremors - Headaches - Stomach pains - Personality changes	**1. REMOVE PERSON AND OTHERS FROM SITE.** **2. REPORT SYMPTOM TO SUPERVISOR** **3. EVALUATE POTENTIAL SOURCES** **4. REQUEST SITE CHARACTERIZATION BY SITE SAFETY OFFICER**

4. Prepared by:	5. Date/time briefed:	**Last Update: 4/25/05**	**SSP-Attach 3: Signs/Symptoms of Toxic Exposure**

CG ICS SSP SPECIFIC HAZARD ATTACHMENT	1. Hazard Heat Stress Attachments:		2. Divisions/Groups/Units affected:		3. Job Tasks Involving Hazard:	
Medical Condition	Action Level	Reference	Signs, Symptoms & Potential Health Effects	Exposure Route	Controls: Engineering, Administrative, PPE	Medical Response
Heat Stroke	Minimize exposure	NIOSH: Working in Hot Environments	Skin is hot Skin is dry Skin is red and spotted Body Temp: 105 or > Mental confusion Convulsions Unconscious	Inhalation Absorption **X** Ingestion Injection Membrane _____	- Acclimitize workers - Avoid direct sun - Institute work/rest regimens - Provide cool rest areas - Drink 5-7 ounces water every 15-20 minutes - Consider ccoling garments - Use heat stress monitors - Use canopies or other shelter - Minimize workers with illnesses and excessive weight	- Get EMT assistance immediately - Remove victim to cool area - Soak clothing w/water - Fan body to increase cooling
Heat Exhaustion	Minimize exposure	NIOSH: Working in Hot Environments	Extreme weakness Giddiness, headache Nausea, Vomiting Skin is clammy & moist Complexion is pale/flushed Body Temp: normal to slightly elevated	Inhalation Absorption **X** Ingestion Injection Membrane _____		- Notify EMT - Rest victim in cool place - Have victim drink plenty of water
Heat Cramps	Minimize exposure	NIOSH: Working in Hot Environments	Painful spasms of muscles Profuse sweating	Inhalation Absorption **X** Ingestion Injection Membrane _____		- Remove victim from site - Ensure victim drinks plenty of water and replaces electrolytes
Fainting	Minimize exposure	NIOSH: Working in Hot Environments	Victim faints due to lack of blood to the brain	Inhalation Absorption **X** Ingestion Injection Membrane _____		- Remove victim to cool area - Ensure victim drinks plenty of fluid - Ensure victim is not sedentary in direct heat
Heat Rash	Minimize exposure	NIOSH: Working in Hot Environments	Skin rash Experience of prickly heat	Inhalation Absorption **X** Ingestion Injection Membrane _____		- Remove victim to cool place - Ensure victim drinks plenty of water

4. Prepared by:	5. Date/time briefed:	**Last Update: 4/25/05**	**SSP-Attach 4: Heat Stress**

CG ICS SSP SPECIFIC HAZARD ATTACHMENT	1. Hazard Cold Stress Attachments:		2. Divisions/Groups/Units affected:		3. Job Tasks Involving Hazard:	
Medical Condition	Action Level	Reference	Signs, Symptoms & Potential Health Effects	Exposure Route	Controls: Engineering, Administrative, PPE	Medical Response
Hypothermia	Minimize exposure	NIOSH: Working in Cold Environments	Pain in extremities Uncontrollable shivering Reduced core temperature Cool skin Rigid muscles Slowed heart rate Weakened pulse Low blood pressure Slow irregular breathing Slurred speech Drowsiness Incoherence Uncoordination Diminished dexterity Diminished judgement	Inhalation Absorption **X** Ingestion Injection Membrane _____	- Reduce manual work load - Ensure workers drink plenty of water - Establish warm locations for breaks - Establish work & rest regimens - Establish shelters, canopies or other devices to reduce wind effect - Minimize sitting still or standing around - Ensure proper sleep - Ensure proper diet - Ensure right balance of protective clothing - Ensure workers are not overheated by clothing	- Remove victim from wind, snow & rain - Minimize use of energy - Keep person awake - Remove wet clothing - Get into dry clothing - Wrap blanket around - Pack neck, groin, armpits with warm packs or towels - Give sweat warm drinks - Remove person to medical facility
Frostbite	Minimize exposure	NIOSH: Working in Cold Environments	Whitened areas of skin Burning sensation at first Blistering Affected part; cold, numb & tingling	Inhalation Absorption **X** Ingestion Injection Membrane _____		- Cover frozen part - Provide extra clothing & blankets - Place affected part in warm water or with warm packs - If no pads, wrap in blanket - Discontinue warming when part becomes flushed and swollen - Exercise part after warming, but place no pressure on it - Give sweet warm fluids - Do not rub part with anything - Do not use hot heating devices on part - Obtain medical assistance
4. Prepared by:	5. Date/time briefed:		**Last Update: 4/25/05**		**SSP-Attach 5: Cold Stress** **Page 1 of 2**	

CG ICS SSP SPECIFIC HAZARD ATTACHMENT	1. Hazard Cold Stress Attachments:		2. Divisions/Groups/Units affected:		3. Job Tasks Involving Hazard:	
Medical Condition	Action Level	Reference	Signs, Symptoms & Potential Health Effects	Exposure Route	Controls: Engineering, Administrative, PPE	Medical Response
Chilblain	Minimize exposure	NIOSH: Working in Cold Environments	Recurring localized ithcing Swelling, painful inflammation of fingers, toes, or ears Severe spasms	Inhalation Absorption **X** Ingestion Injection Membrane	- Reduce manual work load - Ensure workers drink plenty of water - Establish warm locations for breaks - Establish work & rest regimens - Establish shelters, canopies or other devices to reduce wind effect - Minimize sitting still or standing around - Ensure proper sleep - Ensure proper diet - Ensure right balance of protective clothing - Ensure workers are not overheated	- Remove to warmer area - Consult physician
Frostnip	Minimize exposure	NIOSH: Working in Cold Environments	Skin turns white	Inhalation Absorption **X** Ingestion		- Remove to warmer area - Refer to treatment for frost bite
Acrocyanosis	Minimize exposure	NIOSH: Working in Cold Environments	Hands and feet are cold, blue and sweaty	Inhalation Absorption **X** Ingestion		- Remove to warmer area - Loosen tight clothing - Consult physician
Trench Foot	Minimize exposure	NIOSH: Working in Cold Environments	Swelling of the foot Tingling, itching Severe pain Blistering	Inhalation Absorption **X** Ingestion		- Remove to warmer area - Refer to treatment for frost bite - Consult physician
Raynaud's Disease	Minimize exposure	NIOSH: Working in Cold Environments	Fingers turn white & stiff Intermittent blanching & reddening of fingers and toes Affected areas tingle & becomes very red or reddish purple	Inhalation Absorption **X** Ingestion Injection Membrane		- Remove to warmer area - Consult physician
4. Prepared by:	5. Date/time briefed:		**Last Updated: 4/25/05**		**SSP-Attach 5: Cold Stress** **Page 2 of 2**

CG ICS SSP SPECIFIC HAZARD ATTACHMENT	1. Hazard Helicopter Operations Additional Attachments:	2. Helicopter Location	3. Emergency contacts:

Activity	Safe Work Practice	4. Checked [3]
Pre-boarding	- Receive Safety briefing from helicopter operators	
	- Receive emergency extrication briefing	
	- Know location of emergency equipment	
	- Know water landing procedures	
	- Loose fitting hats, clothing & other gear removed at minimum 100 ft away	
	- Ensure operator knows how to contact emergency services	
	- Ensure operator has good communications with coordinating vessels	
	-	
Approaching and Exiting Helicopter	- Approach from front	
	- Approach only when signaled by pilot	
	- Never walk under tail blade	
	- Approach in clear view of pilot	
	- Approach in crouching position	
Onboard Helicopter/Helicopter Startup	- Wear seatbelts	
	- Wear hearing protection	
	- Ground crew & other persons maintain minimum 50 ft from operating helo	
	- Be alert for ground traffic and air traffic to assist pilot	
Other	-

CG ICS SSP SPECIFIC HAZARD ATTACHMENT	1. Hazard Small Boat Operations Additional Attachments:	2. Small Boat Unit Assignment	3. Emergency contacts:

Activity	**Safe Work Practice**	4. **Checked [3]**
Pre-boarding	- Receive safety briefing from boat crew operators	
	- Receive emergency extrication briefing	
	- Know location of emergency equipment	
	- Ensure operator knows how to contact emergency services	
	- Ensure operator has good comms with coordinating vessels & shore units	
	- Ensure comms schedule with parent unit is understood	
	- Ensure distress signals are available for day & night operations (3 per shift)	
	- Ensure qualified operators are running the boats	
	- Ensure appropriate number of CG approved Type I & II preservers	
	- Confirm location of safe seating from boat operator	
	- Ensure portable fuel tanks are full prior to boarding	
	- Keep all sources of ignition away from fueling area	
	- Ensure boat does not exceed safe load capacity (personnel & equipment)	
	- Ensure proper footwear for maintaining adequate boat deck contact	
	- Ensure equipment on boat is distributed evenly to ensure stability	
	- Ensure at least 2 people are operating the boat	
	- Ensure sun protection is available (glasses, and sun screen)	
	- Ensure adequate food & water is available for duration of operation	
	- Ensure first aid kits, fire extinguishers, alternate means of propulsion	
	- Ensure adequate fenders and mooring lines are available	
Boat Operations	- Remain seated whenever possible. Keep low in the boat.	
	- Ensure boat is able to maintain direct contact visually or by radio	
	- Avoid anchoring the boat by the stern	
Boat mooring and egress	- Keep hands & feet away from pinch points between boat & dock	
	- Stay clear of lines being used for mooring	
	- Do not disembark with bulky or heavy equipment, get assistance	
	- If not assisting in the mooring operation, remain seated until lines are tied	

5. Prepared by:	6. Date/time briefed:	**Last Updated: 4/25/05**	**SSP-Attach 8: Small Boat Safety** **Page ____ of _____**

CG ICS SSP SPECIFIC HAZARD ATTACHMENT	1. Hazard Vehicle Operations:	2. Vehicle Unit Designator	3. Emergency contacts:

Activity	Safe Work Practice	4. Checked [3]
Before driving	- Ensure tires are inflated	
	- Ensure gas cap is in place & tight	
	- Ensure front hood and trunk are secured	
	- Ensure spare tire is in good condition	
	- Locate tire changing equipment	
	- Locate emergency road kit	
	- Check headlights, brake, emergency, turn signals and parking lights	
	- Adjust side mirrors	
	- Adjust review mirrors	
	- Ensure horn is in working order	
	- Ensure seat belts fasten	
	- Ensure sunglasses are available	
	- Locate operating switches for lights, wipers, temperature control, defroster	
	- Ensure adequate directions to destination are available	
	- Check to ensure driving route avoids high crime areas	
	- Ensure adequate fuel (keep half full during emergencies)	
Vehicle Operations	- After ignition, look for warning lights.	
	- Test braking system	
	- Obey all traffic signs and speeds	
	- Do not drive if hearing, sight or appendages are impaired	
	- Take frequent breaks; once every 100 miles	
	- During breaks, if sleeping, park in lighted lot and keep doors locked	
	- Do not drive if tired, on medication or under influence of alcohol	
	- Monitor traffic reports for accidents, weather and construction	
Other Precautions	-	
	-	
	-	
	-	
	-	
	-	

5. Prepared by:	6. Date/time briefed:	**Last Updated: 4/25/05**	**SSP-Attach 9: Vehicle Safety** **Page ____ of _____**

CG ICS SSP SPECIFIC HAZARD ATTACHMENT	1. Hazard Insect Hazards Additional Attachments:	2. Divisions/Groups/Units affected:		3. Job Tasks Involving Hazard:
Hazard Type	Potential Sources	Signs & Symptoms	Control	Medical Treatment
Insect Bites & Stings	Bees	<u>Allergic person</u>: -Swollen throat -Difficult breathing -Noisy breath -Sudden pain -Severe itching, hives, acute redness, swelling -white firm swelling -reduced consciousness, shock	- Recon area prior to work & identify nests & habitats - Identify as hazard areas & place on SSP map - Provide insect repellent - Encourage long sleeves & pants if practical - Conduct tick & bite inspection during breaks and prior to departing site - Identify persons with insect allergies & restrict them where necessary - Obtain emergency insect bite kits	- Wash wound with soap & water - Request med assistance for allergic persons - Remove stinger without pinching or squeezing - Use cold pack to reduce swelling, use pad between skin and pack - Keep wounded area below heart to slow spread of venom - Do not administer aspirin or alcohol
	Black Widow Spider	-Systemic poison -Flu – like symptoms -Severe abdominal pain -Rigidity, muscle pain, cramping, -Chest tightness, breathing difficulty, -Pain in soles of feet -Alternating dry & salivating mouth, -Nausea, vomiting -Profuse sweating or swollen eyelids		- Wash wound with soap & water - Request med assistance address symptoms - Use cold pack to reduce swelling, use pad between skin and pack
	Brown Recluse	-Severe redness -Red circle around bite -Bite takes several months to heal		- Wash wound with soap & water - Request med assistance for allergic persons - Remove stinger without pinching or squeezing - Use cold pack to reduce swelling, use pad between skin and pack
	Ticks	-Flu like symptoms -Fever -Rash, joint pain, headaches		- Wash wound with soap & water - Request med assistance for allergic persons - Remove tick with oil, alcohol or heated tweezers - Use tweezers to remove imbedded head - If fever, rash, unusual markings develop around bite, contact physician
4. Prepared by:	5. Date/time briefed:	**Last Updated: 4/25/05**		**SSP-Attach 10: Insect Hazards** **Page 1 of _____**

CG ICS SSP SPECIFIC HAZARD ATTACHMENT	1. Hazard Animal Hazards Additional Attachments:	2. Divisions/Groups/Units affected:		3. Job Tasks Involving Hazard:
Hazard Type	Potential Sources	Signs & Symptoms	Control	Medical Treatment
Mammal Bites	Dogs, Cats Skunks, Raccoons Foxes, Badgers Wolves, Bears Cows	-Pain & tenderness of wound -Redness, heat, swelling -Puss under the skin -Red streaks around wound -Swollen lymph nodes in arm pits, groin & neck	- Recon area prior to work & identify nests & habitats - Identify animals & any unusual behavior - Relocate animals if necessary using wildlife experts - Report rabid animals to local wildlife authorities - Obtain emergency bite kits	- Get medical attention ASAP to address infection - Ensure tetanus shot is updated - Interview individual to determine appearance/disposition of animal - Control serious bleeding - Apply pressure using gauze pad, tourniquets are inadvisable - Wash before touching wound - Wear rubber gloves when treating victim - Wash wounds that are not bleeding heavily - Cover with clean dressing and bandage
		<u>Rabies</u> -Drooling -Irritability -Strange, abnormal behavior		- Get medical assistance immediately
Snake Bites	Coral Snakes Water Moccasins Rattle Snakes Pit Vipers Ticks	*Some or all of these symptoms may be present:* -Fang marks -Swelling, discoloration, pain -Heat around fang marks -Weakness, sweating, faintness, shock <u>Coral snake</u>: -Respiratory paralysis -Bizarre behavior -Unusual eye movement	- Recon area prior to work & identify nests & habitats - Place locations on SSP map - Identify animals & any unusual behavior - Relocate animals if necessary using wildlife experts - Report agressive animals to local wildlife authorities - Obtain emergency bite kits	- Get medical attention ASAP - Ensure tetanus shot is updated - Interview individual to determine appearance/disposition of snake - Control serious bleeding - Apply pressure using gauze pad, tourniquets are inadvisable - Wash before touching wound - Wear rubber gloves when treating victim - Wash wounds that are not bleeding heavily - Cover with clean dressing and bandage
				Poisoned Victim - Get immediate medical attention - Keep patient still to slow spread of venom - Place bite area below heart to slow venom - Wash with soap & water - Use splint to immobilize bitten arms/legs - Use cold pack with gauze before skin - Do not administer aspirin or alcohol - Do not suck out poison - Do not use tournequets
4. Prepared by:	5. Date/time briefed:	**Last Updated: 4/25/05**		**SSP-Attach 11: Animal Hazards** **Page 1 of _____**

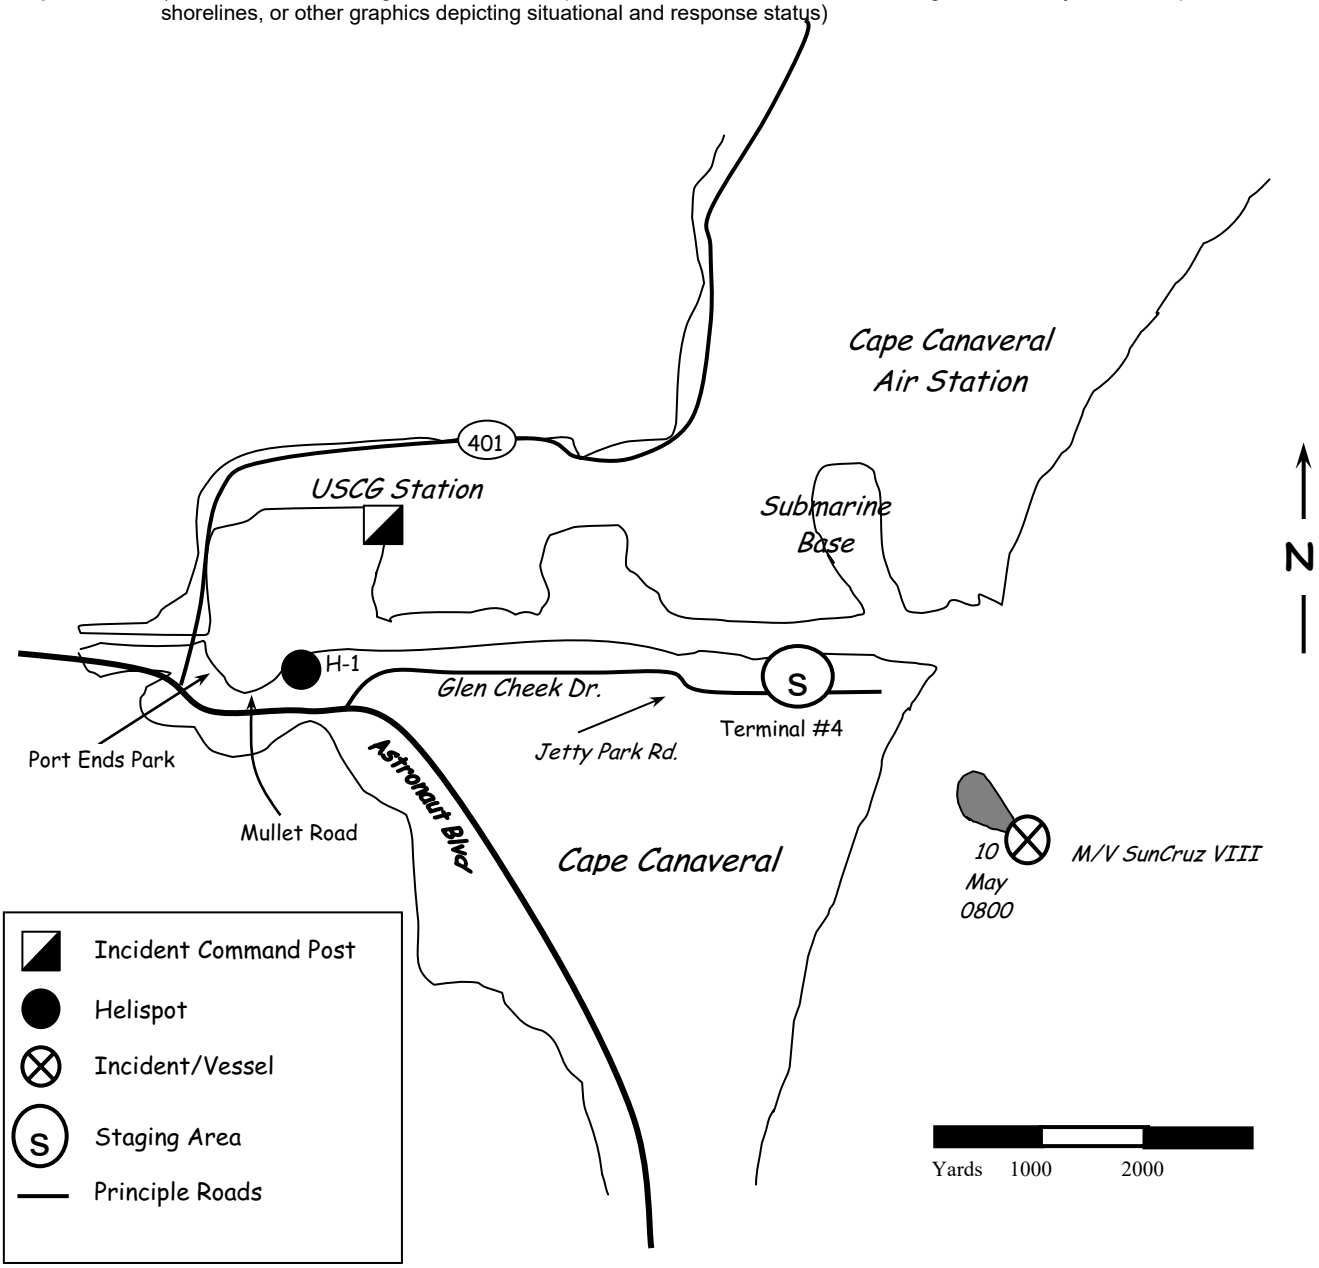
CG ICS SSP SPECIFIC HAZARD ATTACHMENT	1. Hazard Marine Animal and Plant Hazards Additional Attachments:	2. Divisions/Groups/Units affected:		3. Job Tasks Involving Hazard:
Hazard Type	Potential Sources	Signs & Symptoms	Control	Medical Treatment
Animal Stings & Punctures	<u>*Group I*</u> Jellyfish, Portuguese Man-o-war Anemones Corals Hydras <u>*Group II*</u> Urchins, Cone Shells, Stingrays, Spiny fish	-Pain & tenderness of wound -Redness, heat, swelling -Puss under the skin -Red streaks around wound *Sensitive Individuals* -Allergic reactions -Respiratory arrest -Fainting -Infections & tetanus may develop	- Recon area prior to work & identify nests & habitats - Place locations on SSP map - Outfit workers with protective clothing for water activities and to prevent bites	- Get medical attention ASAP to address infection - Ensure tetanus shot is updated - Interview individual to determine appearance of animal - Control serious bleeding <u>*Group I*</u> - Do not rub or scratch affected area - Sprinkle alcohol on affected area, follow with meat tenderizer or talcum if available (denatures toxin) <u>*Group II*</u> - Soak in very warm water for 30 minutes - Do not use very hot water
Plants	Poison Ivy Poison Oak Poison Sumac	*Some or all of these symptoms may be present:* -Itching -Burning -Blistering -Rash & bumpy skin	- Recon area prior to work & identify plant types - Place locations on SSP map - Remove if necessary - Long sleeve shirts and pants should be worn - Gloves should be worn - Wash frequently during breaks & prior to departing work site. - Employ body screen salves	- If contact occurs, wash with soapy water immediately - Do not scratch - Provide medical attention of spreading is severe
4. Prepared by:	5. Date/time briefed:	**Last Updated: 4/25/05**		**SSP-Attach 11: Animal Hazards** **Page 2 of _____**

Example of an ICS-201 Form

9710 Example 201

1. Incident Name	2. Prepared by: B. Nelson, IC	INCIDENT BRIEFING
M/V ATHOS	Date: 20XX Time: 0800	ICS 201-CG

. Map/Sketch (include sketch, showing the total area of operations, the incident site/area, overflight results, trajectories, impacted shorelines, or other graphics depicting situational and response status)



4. Current Situation At 0410 hours today the M/V Sun Cruz VIII, a 600 passenger, 23 crew, 350 ft casino ship reported an explosion aboard and remains on fire. The following key points are known at this time.

- Fire is spreading on board
- The vessel is located about 1½ miles south of Port Canaveral entrance
- An oil slick has been observed in vessel vicinity and is moving in a northwest direction
- Evacuation has been ordered and is underway
- Other vessels are in the area and offering assistance
- There are injuries among the passengers and crew
- Some passengers are in life rafts and are drifting in a northerly direction
- Media helicopters have been observed over the area

9710 Example 201

1. Incident Name **M/V ATHOS**	2. Prepared by: B. Nelson, IC Date: 20XX Time: 0800	INCIDENT BRIEFING ICS 201-CG

5. Initial Response Objectives, Current Actions, Planned Actions

Initial Response Objectives:

- Provide for the safety and welfare of the passengers and nonessential crew.
- Secure scene and immediate area surrounding incident site.
- Ensure accountability and provide temporary shelter for displaced passengers and crew.
- Initiate salvage assessment.
- Initiate efforts to mitigate effects of spilled oil.

Current Actions:

- Establishing safety zone 1 nautical mile around vessel
- Assisting vessel to evacuate passengers
- Picking up persons in lift rafts and transporting to Port End Park
- Attempting to establish a system to account for all passengers and crew
- Establishing medical triage at Jetty Park Road with transport to hospital

Planned Actions:

- Complete accountability of all passengers and crew
- Locate and remove all passengers from life rafts
- Complete triage of injured passengers and crew and transport to hospital
- Order additional resources to begin containment of spill
- Initiate preliminary damage assessment
- Determine extent of oil spill
- Put resources in place to establish and enforce a safety zone
- Order resources for fire suppression operations

Summary: Focus on SAR mission is beginning to phase down and focus on marine safety issues is gearing up. It appears there will need to be a multi-day commitment to mitigate this incident.

Sample Vessel Decontamination Plan

9736 Vessel Decontamination Plan (sample)

The following plan outlines the equipment and proposed methodology to conduct hull decontamination of marine vessels prior to departure from the Captain of the Port Philadelphia zone. The purpose of the plan is to ensure timely and cost effective decontamination of impacted assets related to the casualty and subsequent oil spill.

(5) Decontamination Task Forces are to be utilized with additional systems being available as needed. Each task force will consist of the following:

- (1) Shallow Water Portable Barge System
- (1) Tender Boat
- (2) 16'-18' Flat Boats
- (2) Steam Cleaner
- Containment Boom
- Adsorbent Materials
- (6) Personnel

Prior to commencement of steam cleaning operations, containment boom will be placed alongside or around the vessel as needed. Adsorbent sweep materials will be placed inside the containment boom to collect any residual oil being removed. No detergents or chemicals will be utilized during the decontamination process. All oiled adsorbent material will be bagged and placed in appropriate containers for disposal at an approved TSD facility.

Upon completion of vessel decontamination, each vessel will be inspected and approved by Federal/State representative(s) in accordance with the established Waterways Management protocol prior to transiting outbound.

9744 Tarball and Oiled Debris Removal Plan

I. INTRODUCTION

At 9:30 PM on 26 November, the T/V *Athos I* struck a submerged object while preparing to dock at the Citgo Paulsboro, New Jersey facility. This collision resulted in two holes in the No. 7 port and center tanks. Initial reports indicated that the vessel released 30,000 gallons of a heavy Venezuelan crude oil. On 30 November, the volume spilled was increased to a maximum potential of 473,500 gallons. The final estimate of 265,000 gallons became known on 1/11/05.

The O'Brien's Group (O'Brien's) was notified on the evening of 26 November, as Tsakos Shipping and Trading S.A.'s Qualified Individual, to mobilize their spill management team (SMT) to manage the spill on the Owner's behalf. O'Brien's immediately mobilized their SMT and formed a Unified Command with the U.S. Coast Guard, the State of Delaware, State of New Jersey and the State of Pennsylvania. The Incident Command System continues to be utilized to manage the response.

Given the type and quantity of oil spilled, the National Oceanic and Atmospheric Administration (NOAA) has predicted that tarballs will persist for several months in the Delaware River System. Some tarballs are anticipated to impact the outer coast. The exact location and amount of tarballs depends on the wind, current and tides. Since the mean current along the outer coast is southward, it is anticipated that most of the tarball shoreline contacts will occur south of the Delaware Bay (in Delaware). Local wind events, however, could push tarballs and oiled debris on to New Jersey ocean beaches north of Cape May.

While the general trend for the number of tarballs contacting the outer coast is expected to decrease with time, the exact amount remains uncertain. Thus, there is a possibility that a strong meteorological event or vessel movement could mobilize oil resulting in an episodic increase of tarballs.

This draft plan outlines the actions to be taken by the States and the *Athos I* Unified Command to minimize to environmental and economic impacts of beached tarballs.

II. GENERAL COMMUNITY OUTREACH PLAN

An important part of the tarball and oiled debris removal plan involves outreach to the potentially affected communities. An effective outreach program will provide community members with the information that they need to make informed decisions concerning tarballs in their environment.

In time, it is the goal of this project to develop a specific outreach program for each impacted community. This section describes the general objectives of such a program and lists some possible mechanisms to disseminate this information.

The objectives of the *Athos I* tarball and oiled debris community outreach program are to: (1) Provide the public with contact information should they observe tarballs or oiled debris on the beach, (2) Provide assurance to beach goers that tarballs and oiled debris will be removed from the beach in a timely manner, (3) Provide evidence to community leaders and the tourist industry that the *Athos I* response has a comprehensive plan to manage beached tarballs and oiled debris.

Modes used to disseminate this information may include:

- News releases and advisories with one page fact sheet, contact information including phone number and website (both the states web sites as well as USCG web site).
- Informational letters to elected officials, public agencies, mariners, environmental and conservation groups, tourist groups, health agencies, and law enforcement.
- Website updates and promotion.
- Speaking engagements (selective and targeted).
- Public Service Announcements
- Beachside signage, postings at yacht clubs, marinas, boat stores, lifeguard stations.

9744 Tarball and Oiled Debris Removal Plan

III NEW JERSEY PLAN

A. Community Outreach Plan

In New Jersey, the general community outreach program described in section two will be modified to meet the specific demands of areas where significant beach impacts occur. The New Jersey phone number to report tarballs or oiled debris on the beach is 1-877-WARNDEP (1-877-927-6337). This is the New Jersey Department of Environmental Protection's (NJDEP) Toll Free 24-hour emergency number.

B. Tar Ball & Oiled Debris Response

The New Jersey Department of Environmental Protection (NJDEP) will be contacted should oiled debris or tar balls be sighted on New Jersey beaches. Once contacted, the NJDEP will notify the Cape May County Office of Emergency Management of the situation and then appoint a local state representative to conduct the initial investigation of the beach. The NJDEP Bureau of Emergency Response will decide on the next step in the cleanup process. If the amount of tarballs and/or oiled debris is small, it is likely that the NJDEP will clean the site without using contractors. If the amount of tarball and/or oiled debris is larger, the NJDEP may decide to contact the Operations Section Chief in the *Athos I* Command Center. Depending on the size of the affected area, the Operations Section Chief will either activate local contractors or dispatch a larger crew from the primary response area. In either case, the contractors will remove the tarballs or oiled debris under the supervision of the NJDEP or local state representative. It is not recommended that local state or county representatives remove tarballs or oily debris from the beach.

C. Notifications & Record Keeping

The Operations Section Chief or the Environmental Unit Leader will notify interested parties once cleanup activities have been completed. Notifications may include the NJDEP, Cape May County Office of Emergency Management, and the citizen that made the observation/report. The Environmental Unit Leader will make a record of the report and the cleanup activities and these records will be on file in the *Athos I* Command Center.

IV. DELAWARE PLAN

A. Community Outreach

In Delaware, the general community outreach program described in section two will be modified to meet the specific demands of Sussex County. Specific beach communities in Delaware are likely to include: Slaughter Beach, Fowler Beach, Primehook Beach, Lewes Beach, Rehoboth Beach, State Parks (Cape Henlopen, Delaware Seashore and Fenwick Island), Dewey Beach, Bethany Beach, Fenwick Beach, and Broadkill Beach.

The Delaware phone number to report tarballs or oiled debris on the beach is 800-662-8802 (in Delaware), 302-739-5072 (anywhere), or #DNR (on a Verizon cell phone). This number will connect the caller with the Delaware Department of Natural Resources & Environmental Control (DNREC).

B. Tarball & Oiled Debris Response

The DNREC will be contacted should oiled debris or tar balls be sighted on Delaware beaches. Once contacted, it is likely that the DNREC will assign one of their Environmental Protection Officers and/or an Emergency Response Scientist to conduct the initial investigation. The Environmental Protection Officer and/or an Emergency Response Scientist will decide on the next step in the cleanup process. If the amount of tarballs and/or oiled debris is small, it is likely that the DNREC will clean the site without using contractors. If the affected area is larger, the DNREC may decide to contact the Operations Section Chief in the *Athos I* Command Center. Depending on the size of the affected area, the Operations Section Chief will either activate local contractors or dispatch a larger crew from the primary response area. In either case, the contractors will remove the tarballs or oiled debris under the supervision of the DNREC Environmental Protection officer.

C. Notifications & Record Keeping

The Operations Section Chief or the Environmental Unit Leader will notify interested parties once cleanup activities have been completed. Notifications may include the DNREC, the Sussex County Emergency Operation Center, and the citizen that made the observation/report. The Environmental Unit Leader will make a record of the report and the cleanup activities and these records will be on file in the *Athos I* Command Center.

V. PENNSYLVANIA PLAN

A. Community Outreach Plan

In Pennsylvania, the general community outreach program described in section two will be modified to meet the specific demands of the impacted areas of Pennsylvania. The Pennsylvania phone number to report tarballs or oiled debris on the beach is 1-484-250-5900. This is the Pennsylvania Department of Environmental Protection's (PADEP) 24-hour emergency number Bucks, Chester, Delaware, and Montgomery counties and the city of Philadelphia

.

B. Tar Ball & Oiled Debris Response

The Pennsylvania Department of Environmental Protection (PADEP) will be contacted should oiled debris or tar balls be sighted on Pennsylvania beaches. Once contacted, the PADEP will send a representative to conduct the initial investigation of the beach. The PADEP will decide on the next step in the cleanup process. If the amount of tarballs and/or oiled debris is small, it is likely that the PADEP will clean the site without using contractors. If the amount of tarball and/or oiled debris is larger, the PADEP may decide to contact the Operations Section Chief in the *Athos I* Command Center. The Operations Section Chief will then activate a crew from the primary response area to move to the affected area. The contractors will remove the tarballs or oiled debris under the supervision of the PADEP.

C. Notifications & Record Keeping

The Operations Section Chief or the Environmental Unit Leader will notify interested parties once cleanup activities have been completed. Notifications may include the PADEP and the citizen that made the observation/report. The Environmental Unit Leader will make a record of the report and the cleanup activities and these records will be on file in the *Athos I* Command Center.

VI. MARYLAND PLAN

A. Community Outreach Plan

In Maryland, the general community outreach program described in section two will be modified to meet the specific demands of areas where significant beach impacts occur. The Maryland phone number to report tarballs or oiled debris on the beach is 1-866-MDE-GOTO (1-866-633-4686). This is the Maryland Department of Environment (MDE) Toll Free 24-hour emergency number.

B. Tar Ball & Oiled Debris Response

The Maryland Department of Environment, Emergency Response Division, will be contacted should oiled debris or tar balls be sighted on Maryland beaches. Once contacted, it is likely that the MDE will assign someone from the Emergency Response Division to conduct the initial investigation of the beach. The MDE will decide on the next step in the cleanup process. If the amount of tarballs and/or oiled debris is small, it is likely that the MDE will clean the site without using contractors. If the amount of tarball and/or oiled debris is larger, the MDE may decide to contact the Operations Section Chief in the *Athos I* Command Center. Depending on the size of the affected area, the Operations Section Chief will either activate local contractors or dispatch a larger crew from the primary response area. In either case, the contractors will remove the tarballs or oiled debris under the supervision of the MDE or local state representative. It is not recommended that local state or county representatives remove tarballs or oily debris from the beach.

C. Notifications & Record Keeping

The Operations Section Chief or the Environmental Unit Leader will notify interested parties once cleanup activities have been completed. Notifications will include the MDE, and may include the local Office of Emergency Management, and the citizen that made the observation/report. The Environmental Unit Leader will make a record of the report and the cleanup activities and these records will be on file in the *Athos I* Command Center.

VII. VIRGINIA PLAN

A. Community Outreach Plan

In Virginia, the general community outreach program described in section two will be modified to meet the specific demands of areas where significant beach impacts occur. The Virginia phone number to report tarballs or oiled debris on the beach is 804-674-2400. This is the Virginia Department of Emergency Management (VDEM) 24-hour emergency number at the Virginia Emergency Operations Center (VEOC). The 24-hour toll-free number at the VEOC is 1-800-468-8892.

B. Tar Ball & Oiled Debris Response

Reports of oiled debris or tarballs received by the VEOC will be forwarded to the Virginia Department of Environmental Quality (VDEQ) Tidewater Regional Office (TRO) at 757-518-2077 for appropriate action. VDEQ TRO staff will conduct the initial investigation of the beach or affected area to determine the presence and extent of the tarballs or oiled debris. If the volume of the material is not significant VDEQ TRO will exercise the option to have the tarballs or oiled debris removed as appropriate. If there is a significant amount of material requiring removal, after consultation with the local emergency coordinator and the VDEM Regional Hazardous Materials Officer, VDEQ TRO will contact the Operations Section Chief in the *Athos I* Command Center at 267-765-3445. Depending on the size of the affected area, the Operations Section Chief will either activate local contractors or dispatch a larger crew from the primary response area. In either case, the contractors will remove the tarballs or oiled debris under the supervision of the VDEQ TRO. It is not recommended that any state or local representatives remove tarballs or oily debris from the beach or affected area.

C. Notifications & Record Keeping

The Operations Section Chief or the Environmental Unit Leader will notify interested parties once cleanup activities have been completed. Notifications will include the VDEQ, the local emergency coordinator and the citizen that made the observation/report. The Environmental Unit Leader will make a record of the report and the cleanup activities and these records will be on file in the Athos I Command Center.

Response Functions

With Corresponding Management Units

9749 Potential Response Functions with Corresponding Management Units

The Operations Section Chief (OSC) must identify the response functions that must be accomplished to effectively develop their organization and employ tactical resources. Table 1 lists several response functions (list not inclusive) and the management unit (Groups or Divisions) that provides the best method for accomplishing the particular function. For example, if search and rescue has been identified as a response function, Groups might be the best way to organize search and rescue within the incident command organization.

Response Functions	Management Units
Open water	
□ Product recovery	Group
□ Booming	Group
□ Medical treatment	Group
□ Decontamination	Group
□ Wildlife recovery/rehabilitation	Group
□ Search and Rescue	Group
□ Safety and Security	Group/Division
□ Fire Fighting/overhaul	Group/Division
□ Damage Assessment	Group/Division
□ Salvage	Group/Division
□ Investigation	Group
□ Mass evacuation	Group
□ Skimming	Group
□ Triage	Group
Shoreline	
□ Assessment	Group/Division
□ Pre-impact beach cleanup	Group/Division
□ Safety and Security	Group/Division
□ Beach cleanup	Division
□ Resource protection	Division

Table 1. List of response functions and management units that may be used by the Operations Section Chief to organize their Section.

General Waste Containment & Disposal Checklist

9781 GENERAL WASTE CONTAINMENT AND DISPOSAL CHECKLIST

Consideration	Initials
Estimate types and potential quantities of liquid and solid wastes that will likely be generated	
Make initial determination of hazardous nature of waste materials	
Determine if decanting recovered water will be required and if so begin permitting process	
Identify storage tanks and areas and determine if sufficient capacity is available for each waste type and if not, acquire necessary portable storage	
Identify and contact potential waste transportation contractors to determine capabilities and availability	
Prepare waste management plan [See Waste Management & Disposal Plan]	
Ensure PPE and safe waste-handling procedures are included in the Site Safety Plan and all personnel have reviewed plan and don appropriate PPE	
Construct solid waste storage area including underlying liner and surrounding berms to prevent escapement of contamination	
If offsite waste storage areas are required, collect soil samples prior to use to establish baseline levels of contamination	
Gauge all tanks prior to use to determine quantity of existing contents and enable greater accuracy of quantifying recovered oil accounting	
Designate liquid waste transfer areas and ensure compatibility of transfer equipment with vacuum/tank trucks and/or barges/skimmers	
Ensure proper waste segregation to minimize generation of waste requiring special disposal and assist recovered oil accounting	
Ensure wastes are adequately containerized and secured to reduce potential for further leakage during storage	
Collect representative sample of each waste stream as required for characterization and treatment or disposal	
If the waste is hazardous, contract services of a registered hazardous waste transporter, if not ensure the transporter is registered	
Develop system of recovered oil accounting and waste tracking	
Ensure wastes are transported to approved treatment/disposal sites	
Ensure bill of ladings or manifests are properly completed per DOT requirements and that all copies are maintained in the appropriate files	
Ensure all federal, state, and local laws/regulations are being followed and the appropriate permits have been obtained

PLAN OUTLINE:

1. General Information
2. Guidelines
3. Responsibilities
4. Release Procedures
5. Travel Information

I. GENERAL INFORMATION

Functional Units (Operations, Logistics, Finance & Command) will advise the Planning Section of resources that are surplus to the unit needs. The Planning Section will identify resources surplus to the incident needs. The Demob Function will manage the release and return or reassignment of the surplus resources. The Demob Function consists of two (2) sections, the incident base Demob Unit and Expanded Dispatch. All resources will have a minimum of ___ hours rest prior to leaving the Incident.

The size and location of the Incident Base lends itself to the holding of surplus equipment and personnel while in the Demob process.

II. GENERAL GUIDELINES

A. **NO RESOURCES WILL LEAVE THE INCIDENT UNTIL AUTHORIZED TO DO SO BY THE DEMOB UNIT.**

B. Efforts will be made to ensure that all released personnel arrive home by 2200. All resources must meet individual agency regulations pertaining to rest and travel.

C. All government and hired vehicles leaving the incident will have a safety inspection and deficiencies will be corrected prior to departure for home unless agency head signs a waiver of inspection.

D. All Party Chiefs, Crew Supervisors and Strike Team Leaders will be briefed by the Demob Unit prior to leaving the incident.

E. Notification to incident personnel will be by posting the Projected Releases in advance. Finance and Logistics will be notified as soon as possible when surplus resources are identified for DEMOB.

F. Operators of oversize vehicles (e.g. transports) are responsible for obtaining their own permits required for the return trip back to their point of hire.

G. Actual departure times and ETA at final destination will be relayed to Expanded Dispatch upon departure of all resources from the base. This includes all contract equipment and services.

H. Performance Ratings are required prior to the resource being declared excess to functional needs for:

- **Trainees**
- **Outstanding performances**
- **Deficient performances**
- **By personal request**
- **All Unit Leaders and above**

III. RESPONSIBILITIES

Functional Heads (e.g. Section Chiefs) are responsible for determining resources surplus to their needs and submitting lists (see example attached) to the Planning Section with **Request numbers**, Agency, tentative release date/time, destination, travel needs and availability.

The Demob Unit Leader is Responsible for:

- Preparing the Demobilization Plan.
- Providing Expanded Dispatch with "Projected Releases."
- Providing Expanded Dispatch with confirmation of departing resources (including contract equipment) with their departure time and ETA at their final destination (if they have their own transportation)
- Making notifications to the surplus incident personnel regarding tentative and final releases.
- Ensuring that all signatures are obtained on the Demob Checkout form (ICS-221)

Monitoring the Demob process and making necessary adjustments in the process to avoid untimely delays and ensure accurate and timely flow of release information.

The Incident Commander is responsible for:

- Establishing Incident release priorities in concert with the Santa Barbara County Fire Department.
- Review and approval of the Demobilization Plan.
- Review and approval of projected release lists.

The Safety Officer is responsible for:

- Identifying any special safety considerations of the Demob Plan.
- Approval of projected surplus functional resources.

The Planning Section Chief is responsible for:

- Review and approval of the Demob Plan.
- Review and approval of projected release lists.
- Approval of projected surplus Functional Section resources.

The Logistics Section Chief is responsible for:

- Insuring, through Facilities, that all sleeping and work areas are cleaned up before personnel are released.
- Insuring, through Supply, that all non-expendable property items are returned or accounted for prior to release.
- Insuring, through Ground Support, that there will be adequate ground transportation during the release process and that all government vehicles and hired equipment receive a safety inspection prior to leaving the incident. Any deficiencies must be corrected prior to leaving.
- Insuring, through Communications, that all radios and cell phones have been returned or accounted for.
- Insuring, through Food Unit, that there will be adequate meals for those being released and for those remaining in camp.
- Review and approval of the Demob plan.
- Approval of projected surplus functional resources.

The Finance Section Chief is responsible for:

- Completion of all time and equipment reports, compensation and claims packages for released resources.
- Contract equipment payments for released vendors.
- Providing justification (i.e. excessive shift, coyote, meal breaks etc.) with IC signature to released personnel requesting it.
- Approval of projected surplus Functional Resources.
- Review and approval of the Demob Plan.

The Operations Section Chief is responsible for:

- Review and approval of the Demob Plan.
- Approval of projected surplus Functional Resources.

IV. RELEASE PRIORITIES

The Incident Commander has established the following release priorities:

1.
2.
3.
4.
5.

V. RELEASE PROCEDURES

Section Chiefs will identify surpluses within their units and submit a list (or lists) to the Demob Unit in the Planning Section.

Demob will combine lists and form a "Tentative Release" list to be submitted to the IC for review and approval. Demob will work with Resources Unit so that the resource status board can be kept current. Any incident formed Strike Teams must be disbanded before IC approval and release from the incident.

After IC approval, Demob will notify Expanded Dispatch of the tentative releases and obtain approval. Demob will give Ground Support lead-time to arrange for ground transportation for crews and overhead from the base to the departure point.

Crew Leaders or individuals will take the Demob Checkout form (ICS-221) to:

1. Communications Unit (to return communications equipment).
2. Ground Support (for vehicle safety inspection as needed).
3. Supply Unit (to return all non-expendable property.)
4. Documentation Unit (logs and performance ratings).
5. Time Unit and obtain completed Fire Time Report.
6. DEMOB UNIT WITH ALL SIGNATURES.

DEMOB UNIT WILL BE THE LAST STOP IN THE RELEASE PROCESS. Demob will:

- Collect and sign off the Demob Checkout Form (ICS-221)
- Brief the released personnel on method of travel, schedule, time frames and radio travel frequency.
- Release the resource from the base.
- Advise Expanded Dispatch of ETD & ETA to the home base or transportation point.
- Co-ordinate with the Resource Unit so that resource status is kept current.

9786 Sample Demobilization Plan

DEMOBILIZATION PLAN
M/V BANEASA

GENERAL INFORMATION:

Demobilization will occur in two phases. Phase one will go into effect once the vessel is safely anchored in Adak Harbor. *Phase* two will commence once final disposition of the vessel is safely completed.

All field deployed personnel and equipment can only be demobilized by LCDR Theriault.

No personnel or equipment will leave the incident until authorized to do so.

Demobilization will be accomplished in a cost effective manner

Phase One: Release priorities for personnel and equipment resources will be guided by the following priorities:

1. Non-local responders.
2. Response resources not listed in phase two demobilization.

USCGC Midgett will remain on scene until it is determined it is operational no longer needed or after the vessel is safely anchored in Adak Harbor. Release of the USCGC Midgett will also depend upon the report received from the attending Marine Inspector.

Phase Two: The following resources will remain attached to the incident until ordered to demobilize by the Unified Command. Personnel and equipment will remain with the
vessel.

1 One MSO Anchorage Marine Inspector.
2. One Pacific Strike Team personnel.
3. One "M" type Inmarsat.
4. Commercial towing assets as specified by the Captain of the Port in consultation with other members of the Unified Command.

COMMON RESPONSIBILITIES

1. Safety of personnel is paramount during demobilization
2. All incident response personnel shall follow the guidelines put forth in this plan.
3. ICS Form 221 will be used to check personnel out of the incident.
4. All equipment checked out must be returned to the appropriate section.

9786 Sample Demobilization Plan

SECTION CHIEFS RESPONSIBILITIES

The Planning Section Chief:

1. Shall ensure demobilization information is disseminated in sufficient time to ensure the orderly downsizing of incident resources.

2. Submit proposed release of resources for Unified Command approval. Ensure approved releases receive and comply with Demobilization check-out form ICS Form 221.

Operations Section chief:

1. Identify and communicate excess personnel and equipment available for demobilization to the Planning Section Chief.

Logistics Section Chief:

1. Coordinate all personnel and equipment transportation needs to final destinations.
2. Ensure all communications equipment is checked in and verified.

Finance/Administration Section Chief:

I. Is responsible for completion of personnel time reports.

2. Completion of equipment time reports.

AIRCRAFT

C-130: Demobilization will be contingent upon all Adak Harbor response personnel and equipment being returned to Anchorage/Sacramento.

H-60: Demobilization will be determined after evaluation of operational requirements in Adak Harbor

ACTUAL CHECKOUT PROCEDURES

When final approval and instructions are obtained the Demobilization Unit will:

1. Notify personnel to be released as soon as possible.
2. Prepare ICS Form 221.

COMMAND POST RELOCATION

9786 Sample Demobilization Plan

The Unified Command will evaluate and establish the date to transfer all command post functions from the state emergency operations center to MSO Anchorage.

ICP Move Plan

INCIDENT COMMAND POST MOVING PLAN T/V ATHOS I

NOVEMBER 29, 2004

TABLE OF CONTENTS

PG. 1..... OBJECTIVES
PG. 2-3.....USCG COMMAND POST CHECKLIST
PG. 4..... PARKING
PG. 5-6.....MAP
PG. 7..... MEALS
PG. 8-9..... COMMAND POST LAYOUT
PG. 10..... PHONE NUMBERS

OBJECTIVE:

The purpose of this plan is to ensure a timely and effective movement of the Incident Command Post, from Sector Delaware Bay to the Holiday Inn Historic District (see Mapquest directions and map on pages 5-6).

All personnel are requested to bring all equipment necessary to conduct work in their ICS positions

(printers, laptops, etc.)

2.0 INCIDENT COMMAND POST CHECK OFF SHEET

2.1 Site Selection Criteria

- ❑ Determine organization size and the space requirements of each function
- ❑ Is the facility in a secure area
- ❑ Locate in proximity to the incident
- ❑ Convenient for Agency/ Organization Executives to access
- ❑ Adequate secure parking
- ❑ Appropriate work space separation
- ❑ Adequate meeting/ briefing room space
- ❑ Additional telephone lines are available and the facility will accommodate the
- ❑ Able to control public access
- ❑ Proximity to helo [pad/landing zone
- ❑ Quite area away form major distractions such as airports and railroads
- ❑ Close proximity to billeting and feeding facilities such as other agency operations centers and EOC's
- ❑ Rental or lease cost of facility
- ❑ Adequate wall space for required displays
- ❑ Locate of harms way
- ❑ Need for a separate Joint Information Center
- ❑ Additional space available for co-locating the incident base

2.2 Setup and Operating Requirements

- ❑ Develop sketch map of facility
- ❑ Designate name of ICP (incident name)
- ❑ Develop clear directions map along with reference points for locations facility
- ❑ Establish a check-in desk with recorder and ICS 211 forms
- ❑ Assign work space and identify each functional area
- ❑ Ensure that check-in has location of all functions
- ❑ Provide security for the facility and parking area
- ❑ Establish facility and services contract and agreement to include daily maintenance
- ❑ Procure required furniture, equipment, and supplies
- ❑ Install communications system
- ❑ Conduct facility and grounds safety and security evaluation and mitigate problems as needed
- ❑ Develop and post an emergency evacuating plan and brief staff
- ❑ If required, augment sanitation facilities
- ❑ If required, negotiate facility use agreement

2.3 Equipment Requirements

- ❑ Fax machines incoming and outgoing

- Professional quality copy machine
- Video projector and projection screen
- Easels and flip charts
- Wall clocks
- Television with necessary connections to be comparable with audio visual equipment
- Computers and printers radios display processor for displays digital and video camera
- ICS position vest
- Maps and charts as needed
- Dry erase boards
- T-card racks (resource status)
- Admin support kits for plans, logistics and finance

PARKING

1. Parking is free to all Command Post Personnel.

2. Personnel are to park in the garage and report to Command Post Sign-in. This area is located in front of the Franklin Room.

3. Upon signing in, you will receive a parking pass to be displayed in your vehicle windshield.

Driving Directions
Sector Delaware Bay
To
Holiday Inn, Historic District

1. From Sector Delaware Bay, Philadelphia turn RIGHT onto Columbus Blvd. Proceed approx. 1 mile.

2. Take RIGHT ramp toward HISTORIC AREA / MARKET STREET / CENTER CITY.

3. Turn LEFT onto Market Street.

4. Turn RIGHT onto 3rd Street.

5. Turn LEFT onto Arch Street.

6. Turn LEFT onto 4th Street.

7. Holiday Inn Parking Entrance is on the RIGHT.

Shoreline Signoff Plan

9797 Shoreline Sign Off Example

T/V ATHOS I Response Shoreline Sign-Off Plan

I – Introduction

It has been recognized that a method is needed to assess the status of affected shoreline with respect to the Unified Command (UC) approved cleanup endpoints. The following procedures detail the persons required to conduct the assessment, what data is necessary to be documented, and what actions are warranted in response.

II – Purpose

This document outlines the procedures used to determine if a shoreline segment meets the UC approved endpoints and to release that segment from planned cleanup operations.

III – Scope

These procedures are effective for all identified SCAT zones of the Delaware River and Delaware Bay shoreline, unless otherwise determined by the UC.

IV – Method

A flowchart illustrating the procedures for Sign-Off is provided as Figure 1.

A –Preliminary Inspection

While a segment of shoreline is in active cleanup it is the responsibility of a site supervisor and an FOSC representative under the operations section. At such time as the responsible supervisor and the FOSCR deems a segment to meet the UC Approved Endpoints, or that further action will not yield a net environmental benefit, the supervisor will notify the Environmental Unit (EU) and request an preliminary inspection. The EU will then conduct a review of shoreline conditions in the segment. This review will result in an internal report to the Operations section that indicates either continuing deficiencies with respect to the endpoints and/or a recommendation for a formal inspection.

B – Formal Inspection

Once a segment of shoreline passes EU review, a formal inspection will be scheduled. This inspection will be conducted by a Shoreline Inspection Team (SIT). The SIT will evaluate the segment with respect to the UC approved cleanup endpoints.

C – Shoreline Inspection Team

Formal inspection of shoreline will be conducted by a Shoreline Inspection Team (SIT). Each team will consist of the FOSC, the SOSC for the segment being inspected, and any additional representative deemed appropriate by them. In addition, an SOSC from the other two states is requested to be in attendance but not required. The OSCs may be substituted by authorized agents. A representative of the EU will also attend as a non-signatory facilitator and recorder.

D – Inspection Dates

Formal inspection will take place as soon as possible after recommendation by the EU, taking into consideration tide and weather conditions.

E – Recorded Data

During a formal inspection, the SIT will document their findings on the Shoreline Sign-Off Inspection Form (SSIF). This form is a recommendation to the UC on shoreline conditions. Each form will document whether a segment meets the approved endpoints and any recommendation for future actions in that segment.

- For any segment where additional work is recommended, the SIT must record specific sites, along with photo documentation, where the work is to be performed and indicate precisely what work should be undertaken.
- In all cases, the SIT should strive for consensus on recommendations. If, however, consensus cannot be reached, the dissenting party should indicate their disapproval in the appropriate checkbox and provide a written explanation of the reason for the dissent.
- All OSCs, or their representatives, in attendance, as well as any invited interested parties, must sign the inspection form in order for the recommendation to be passed to the UC.

F – Post Inspection

All SSIFs will be presented to the UC for review. After considering the findings of the SIT, the UC will determine what actions, if any, will be take in a particular segment. If further action is required in a segment, the UC will return the recommendations, in whole or in part, to the Planning section, along with any other recommended action it deems necessary. The segment will then reenter a cycle of internal review until all items are corrected or it is determined by operations that no further work is feasible. The site will then be presented for re-inspection by a SIT.

- Once a SIT determines that a segment meets the endpoints, or that no further action is feasible, the segment can be recommended for monitoring. The duration and type of monitoring will be recommended by the SIT, taking into consideration previous oiling conditions, conditions of adjacent segments and seasonal variations. Final determination on monitoring status will also be reserved to the Unified Command.
- The UC will indicate their acceptance of the recommendations of the SIT for each segment on the Shoreline Sign-Off Record (SSR) for that segment.

G – Sign-Off

The UC reserves to itself the final determination of the status of any shoreline segment. When a segment is ready to be released from the response, the UC will indicate this on the SSR by checking the appropriate box. There are two options: Sign-Off and Sign-Off with Comments.

- Sign-Off – this indicates that a segment of shoreline is released from the response with respect to further planning and action.
- Sign-Off with Comments – this indicates that the shoreline is released from the response with some special consideration. These considerations can include, but are not limited to, a condition below the approved endpoints, special monitoring instructions, and/or future maintenance actions. The comments are to be written in the given space on the SSR. Sign-Off, with or without comments, of any segment does not preclude any subsequent action that may be deemed necessary by the Unified Command.

REVIEWED BY:

Safety Staff Safety Officer 12/9/04

PURPOSE

This plan serves to identify general guidance procedures to be followed by personnel involved in the decontamination of oil spill recovery vessels, boats, boom, vehicles, equipment, etc. either contaminated or suspected of being contaminated with oil, to return it to a non-oiled state.

SITE SPECIFICS

Site Location: The Lagoon, Essington, Pennsylvania

Description: Crude oil spill from the M/T ATHOS I

Contact Person: _____

Phone: _____

CONCEPT OVERVIEW

In view of the extensive equipment inventory involved in this response effort, the responsible party will oversee decontamination of oil spill recovery vessels and equipment.

METHODOLOGY

Spill Response Vessels

Decontamination of spill response vessels will occur at The Lagoon, Essington, PA.

All vessels that can be hauled from the water for cleaning will be hauled out utilizing the crane available in the decon area. The vessel will be transferred to a decontamination pool. The vessels will be blocked using jack stands and wood cribbing or appropriate size trailers. Some response vessels may also require cleaning of skimming units, tanks, decks and other ancillary equipment.

Large vessels that cannot be removed from the water will be placed inside standard contractor containment boom (~8x12) during the decontamination process. This decontamination zone area may utilize a boom anchoring system to prevent the collapse of the perimeter protection during tidal changes and surges. Sheen emanating from the process of decontaminating these vessels will be collected with sorbents. Floating sorbent materials shall be utilized in

natural collection points as needed to retain free-floating oil. These sorbents will be tended and replaced as necessary.

If necessary for larger vessels, a mobile decontamination team will be assigned to its moored location. A vessel specific work plan will be developed for the each to ensure that skimming equipment, storage tanks, piping systems, deck gear and the vessel hull is cleaned to agreed-upon standards. A marine chemist or a ***shipyard competent person*** may be utilized to determine tank entry (if required) and the Qualified Individual or designated representative will certify cleanliness of affected equipment.

If necessary, a decontamination work plan may be created for each response vessel. These plans may be added as appendices to this document. Preplanning for protection of adjacent areas shall be accomplished in order to minimize cross contamination.

CONFINED SPACE

If a tank or space fits the definition of a Confined Space as outlined in the attached NRCES Injury and Illness Prevention Program procedure, a confined space permit will completed as outlined and a confined space rescue plan will completed. These confined spaces entry will be conducted in compliance with all applicable State and Federal regulations.

Recovered oil retained in cargo tanks will be removed from the cargo tanks. A citrus-based cleaner may be sprayed onto the floors and walls of the cargo tanks to facilitate cleaning. The walls, floor, ladders, domes, hatchways, etc. will be cleaned with hot water pressure washers. Sludge, scale, cleaning wastes and rinse waters will be removed by vacuum truck or by hand as appropriate.

Before confined space entry and cleaning begins, a personnel decon station will be established on the vessel being cleaned. The decon station will consist of sorbent rug, boot wash tubs, scrub brushes, cleaning solvent, and a container for contaminated PPE.

CONTAINMENT BOOM & PORTABLE EQUIPMENT

Containment boom, skimmers and other small equipment will be decontaminated in decon pools. Items to be decontaminated will be placed within a decon pool where it will be washed with diesel or an approved degreaser followed by a fresh water wash.

EQUIPMENT PRIORITY

A priority assessment will be attached to each piece of equipment to ensure a timely flow of equipment through the cleaning process. The Decon Site Manager will prioritize the spill response to be cleaned. Depending upon priority, equipment will be hauled by the mobile crane.

CLEANING PROCESS

All wastewater will be pumped to a portable storage tank or vacuum truck for disposal. All pumps, hoses and piping will be left in place to facilitate speedy evacuation of retain. The final disposal of wash water, oiled sorbents and materials will be accomplished in accordance with the Disposal Plan.

A citrus-based cleaning solution will be utilized as a degreaser. The degreaser may be applied by Hudson sprayer. When applying the degreaser the technician will stand upwind. By utilizing the citrus-based degreaser product, which will not emulsify the oily water, it is possible to recycle / reclaim the rinsates. Because this cleaning solution is citrus based is does not leave a petroleum sheen on the equipment after the cleaning process.

Actual pressure washing, if required, will utilize a hot/cold pressure washer with a temperature range up to 220° F and a pressure rating up to 3000 psi.

All personnel involved in the cleaning operation will wear modified PPE Level D including rain gear, gloves, rubber boots, and eye protection (face shield and safety glasses). In addition, any personnel working within the arc of an overhead crane or travelift will wear a hard hat.

Once the piece has been determined clean to the accepted standard, the equipment is transferred to the designated "clean" holding area.

DIESEL OIL

The use of diesel oil as a cleaning agent requires additional safety procedures including air monitoring, respiratory protection and appropriate PPE. The Safety Staff must be notified before an decontamination with diesel oil commences.

AIR MONITORING

The Safety Staff has devised an air monitoring plan for the application of the citrus-based degreaser and if utilizing diesel oil.

Prepared by	Compliance Services Group Acuity Specialty Products Group 1420 Seaboard Industrial Blvd. Atlanta, GA 30318

Section 2. Composition, Information on Ingredients

Name of Hazardous Ingredients	CAS #	% by Weight	Exposure Limits
D-LIMONENE - orange distillate; citrus terpene; cyclohexene, 1-methyl-4-(1-methylethenyl)-, (R)-	5989-27-5	>90	Not available.

Section 3. Hazards Identification

HMIS

	1
	2
Reactivity	0
Personal Protection	B

Acute Effects Routes of Entry Eye contact. Skin contact Inhalation.

Skin	Hazardous in case of skin contact (irritant, sensitizer). May cause allergic reactions to certain individuals. Prolonged or repeated contact may dry skin and cause irritation.
Eyes	Hazardous in case of eye contact (irritant). Inflammation of the eye is characterized by redness, watering, and itching.
Inhalation	Hazardous in case of inhalation. Over-exposure by inhalation may cause respiratory irritation.
Ingestion	Aspiration hazard if swallowed- can enter lungs and cause damage. No data on acute toxicity of the product when ingested.

Carcinogenic Effects Ingredients: Not listed as carcinogen by OSHA, NTP or IARC.

Chronic Effects Prolonged or repeated contact may dry skin and cause irritation. Defatting properties, may aggravate an existing dermatitis

See Toxicological Information (section 11)

Section 4. First Aid Measures

Eye Contact	Immediately flush eyes with running water for at least 15 minutes, keeping eyelids open. Get medical attention if irritation develops.
Skin Contact	Wash with soap and water. Cover the irritated skin with an emollient. Get medical attention if irritation develops.
Inhalation	If excessive quantities inhaled, remove to fresh air. If symptoms persist, seek immediate medical attention.
Ingestion	Do NOT induce vomiting unless directed to do so by medical personnel. Never give anything by mouth to an unconscious person. If affected person is conscious, give plenty of water to drink. Get medical attention immediately.

Section 5. Fire Fighting Measures

Flash Point	CLOSED CUP: 49.4°C (120.9°F). (Tagliabue.)
Flammable Limits	Not determined.
Flammability	COMBUSTIBLE.
Fire Hazard	Combustible liquid and vapor.
Fire-Fighting Procedures	Use foam or all purpose dry chemicals to extinguish. Carbon Dioxide (CO_2). Cool closed containers exposed to fire with water. Wear special protective clothing and positive pressure, self-contained breathing apparatus.

Section 6. Accidental Release Measures

Spill Clean up Eliminate all ignition sources. Put on appropriate personal protective equipment (see Section 8). Absorb with an inert material and place in an appropriate waste disposal container. To clean the floor and all objects contaminated by this material, use detergent. Finish cleaning by spreading water on the contaminated surface and dispose of according to local and regional authority requirements.

Product Code (HS) Last Safety Data Sheet Product Name: BIO ORANGE (LIQUID)

Section 7. Handling and Storage

Handling Keep away from heat, sparks and flame. Avoid contact with skin and eyes. Avoid breathing vapors of this product. Wash thoroughly after handling. Wash contaminated clothing before reusing.

Storage Store and use away from heat, sparks, open flame or any other ignition source. Keep container tightly closed in a cool, well-ventilated place. Store between 40°F - 120°F. Keep out of the reach of children.

Section 8. Exposure Controls/Personal Protection

Personal Protection

Protective Clothing (Pictograms)

Eyes Safety glasses.

Body Gloves.

Respiratory Use with adequate ventilation. Provide exhaust ventilation or other engineering controls to keep the airborne concentrations of vapors below their respective threshold limit value. Wear appropriate respirator when ventilation is inadequate.

Section 9. Physical and Chemical Properties

Physical State	Liquid.	**Color**	Orange.
pH	Not applicable.	**Odor**	Orange. (Strong.)
Boiling Point	170°C (338°F)	**Vapor Pressure**	0.3 kPa (1.9 mmHg) (at 20°C)
Specific Gravity	0.85 (Water = 1)	**Vapor Density**	4.7 (Air = 1)
Solubility	Emulsifies in water.	**Evaporation Rate**	<1 compared to Water
		VOC (Consumer)	789 (g/l). (92.7%)

Section 10. Stability and Reactivity

Stability and Reactivity The product is stable.

Incompatibility Avoid contact with strong oxidizers, excessive heat, sparks or open flame. Incompatible with some strong acids. Reactive with acidic Cl[illegible].

Hazardous Polymerization Will not occur.

Hazardous Decomposition Products Carbon Dioxide, Carbon Monoxide and Other organic materials.

Section 11. Toxicological Information

Toxicity to Animals d-Limonene:

ORAL (LD50): Acute: 5600 mg/kg [Mouse]. 4400 mg/kg [Rat].

DERMAL (LD50): Acute: >5000 mg/kg [Rabbit

Section 12. Ecological Information

Ecotoxicity Not available.

Biodegradable/OECD Not available.

Section 13. Disposal Considerations

Waste Information Waste must be disposed of in accordance with federal, state and local environmental control regulations.

Waste Stream Code: D001
Classification: Hazardous Waste
Origin: RCRA

Consult your local or regional authorities.

Section 14. Transport Information

Proper shipping name Not applicable.

DOT Classification Not a DOT controlled material (United States). **UN number** Not applicable.

Section 15. Regulatory Information

U.S. Federal Regulations

SARA 313 toxic chemical notification and release reporting: No products were found.

Clean Water Act (CWA) 311: No products were found.

Clean air act (CAA) 112 regulated toxic substances: No products were found.

Section 16. Other Information

To the best of our knowledge, the information contained herein is accurate. However, neither the above named supplier nor any of its subsidiaries assumes any liability whatsoever for the accuracy or completeness of the information contained herein.

Final determination of suitability of any material is the sole responsibility of the user. All materials may present unknown hazards and should be used with caution. Although certain hazards are described herein, we cannot guarantee that these are the only hazards that exist.

APPENDIX B

NRCES INJURY AND ILLNESS PREVENTION PROGRAM PROCEDURES

The Safety Staff has reviewed these procedures and requires the following modifications when doing Confined Space Entry.

23.4 Rescue Services

23.4.2.1 NRCES Entry Supervisor shall ensure at least one standby personnel at the site is trained and immediately available to perform non-entry rescue and emergency services.

23.4.2.3 If Fire Department rescue teams are not available, the Safety Staff must be notified. An appropriate rescue team must be made available from another source.

21.0 Cold Stress

21.1 PURPOSE

FES recognizes that work must be performed in various weather conditions, including cold weather. In order to minimize cold related illnesses, site supervisors are to be aware of the symptoms of and environmental conditions that lead to cold-related illnesses. Appropriate steps must be taken to prevent cold-related illnesses. This procedure describes the causes, symptoms, treatment and/or prevention of cold-related illness.

21.2 GENERAL INFORMATION

21.2.1 When the temperature of the surrounding air or water is much colder than the worker, the body's physical processes must increase to maintain thermal balance. Shivering is the body's attempt to generate increased heat.

21.2.2 Shivering, pain and numbness are not trustworthy indicators to cold exposures, because prolonged cold exposure numbs all body sensations.

21.2.3 Wind-chill temperature is a better means of evaluation as it takes into account the wind's ability to strip heat from the body through convection.

21.2.4 Protective clothing that is wet with sweat or from rain will cause heat loss through conduction.

21.2.5 Personnel are at an extreme cold stress hazard when performing spill clean-up in boats in cold weather situations. Falling into cold water can rob body heat very quickly.

21.3 COLD INJURY

21.3.1 **TRENCH FOOT** occurs as a result of extended exposure of the feet to cold and moisture. Capillary walls of the feet are injured, resulting in tingling, itching and pain. Blisters may form followed by ulceration of the skin.

21.3.2 **FROST-NIP** is localized superficial freezing of extremities such as ears, nose, toes, and fingers. Initially there is a dark bluish color due to bleeding under the skin that at times can become gangrenous.

Worker experiencing frost nip are susceptible to future injury and should avoid chilling.

21.3.3 **FROSTBITE** occurs when the moisture in the skin actually freezes, forming ice crystals, resulting in the damage of skin cells. The injured area becomes red, then blue/red. A burning pain is noted initially, then pain decreases and numbness sets in. The skin becomes waxy pale in appearance because of lack of oxygen. The ears, nose, toes and fingers are most susceptible. The damaged area can become gangrenous resulting in the loss of tissue, finger tips and toes.

21.3.4 **HYPOTHERMIA** occurs when heat production of the body is not sufficient to replace heat lost to the environment. The results are a lowering of the core body temperature, the pulse rate slows, muscular weakness occurs, mental abilities dull and the worker becomes uncoordinated. Signs of hypothermia are evident at 95 degrees Fahrenheit body core temperature and consciousness is lost between 89.6 - 86.0 degrees Fahrenheit. At lower core temperatures, cardiac arrest is possible.

Exposure to cold water decreases the body core temperature rapidly and consciousness is quickly lost. Workers on or over water should be acutely aware of the danger of immersion during cold weather.

Hypothermia results in dulling of the senses and could result in poor decision making. Workers that are exposed to extreme cold should not be given tasks that are critical to their health and safety and that of others.

21.4 PREVENTION

Just as with heat stress, cold stress must be controlled in order to prevent cold related illness. The following are cold stress prevention guidelines.

21.4.1 **EDUCATION** - All personnel will receive training on the cause, symptoms, and most importantly, methods of prevention of cold stress injuries.

21.4.2 **CLOTHING** - Prevention of hypothermia and other cold injuries is best accomplished by protecting workers from cold and moisture. Clothing is the most important factor in prevention of injury. Personnel working on land should layer clothing with the outer layer being wind and water-resistant. The layers should be capable of being vented at the

wrist, neck and waist to reduce wetting by perspiration. Feet should be kept dry and socks should be changed when they become wet. Gloves that protect the hands from cold, but allow freedom of movement, are necessary. Never allow bare skin to contact metal surfaces at sub-zero temperatures.

21.4.3 **ACCLIMAZATION** - A limited degree of acclimatization can occur from exposure and working in cold environments. Some physiological changes do occur but people also learn how to more effectively protect themselves from temperature extremes.

21.4.4 **FLUID REPLACEMENT** - Cold weather does cause significant water loss as a result of the dryness of the air. Fluid intake should be increased to prevent dehydration, which directly affects blood volumes and flow to the extremities. Warm, sweet, caffeine-free, nonalcoholic drinks and soup offer the best fluid replacement and provide caloric energy.

21.4.6 **WORK/REST REGIMENS** - When air temperatures are less than 20^0F (actual or wind-chill), heated warming shelters should be made available. Workers should use these on regular basis.

21.4.7 **DIET** - As with any work in extreme temperatures, personnel will be instructed to eat a well-balanced diet to replace calories burned and to provide necessary vitamins and nutrients.

21.4.8 **ENVIRONMENTAL MONITORING** - Regular monitoring of the environment by recording wind speed and actual thermometer readings for comparison to the wind-chill chart should occur at regular intervals depending on conditions.

21.4.8 **PROHIBITED ACTIVITIES** - Alcohol should not be consumed because it increases blood circulation to the skin and interferes with internal thermostatic control. Alcohol also interferes with mental acuity, which can lead to risk taking. Cigarette smoking should be prohibited since the nicotine restricts the flow of blood to the extremities.

21.4.9 **MARINE OPERATIONS** - Personnel involved in marine operations aboard vessels, skimmers and/or shoreline cleanup will be provided with Mustang (or equivalent) full exposure suits. Great care should be taken to reduce the risk of personnel falling into the water due to ice or slippery conditions on vessel decks, ladders, docks and rocks.

23.0 Confined Space Entry

23.1 PURPOSE

The purpose of this procedure is to establish confined space entry standards for all NRCES employees and subcontractors. This procedure exceeds the guidelines contained in the Occupational Safety and Health Administration (OSHA) Permit-required Confined Spaces standard 29 CFR 1910.146 and requirements outlined in Cal OSHA Article 108 -5157.

NRC Environmental Services Corporation (NRCES) and subcontractors shall enforce this procedure as a means of protecting the health and safety of workers while entering, working in, and exiting confined spaces. Before entry, the worker will be made aware of the hazards of confined space work and the safe work practices necessary.

23.2 DEFINITIONS

23.2.1 **Acceptable entry conditions:** The conditions that must exist in a permit space to allow entry and to ensure that employees involved with a permit-required confined space entry can safely enter into and work within the space.

23.2.2 **Attendant:** An individual stationed outside one or more permit spaces who monitors the authorized entrants and who performs all attendant's duties assigned in the employer's permit space program.

23.2.3 **Authorized entrant:** An employee who is authorized by the employer to enter a permit space.

23.2.4 **Confined space:** A space that:

(1) Is large enough and so configured that an employee can bodily enter and perform assigned work; and

(2) Has limited or restricted means for entry or exit (for example, tanks, vessels, silos, storage bins, hoppers, vaults, and pits are spaces that may have limited means of entry.); and

(3) Is not designed for continuous employee occupancy.

23.2.5 **Entry:** The action by which a person passes through an opening into a permit-required confined space. Entry includes ensuing work

activities in that space and is considered to have occurred as soon as any part of the entrant's body breaks the plane of an opening into the space.

23.2.6 **Entry permit (permit):** The written or printed document that is provided by the employer to allow and control entry into a permit space and that contains the information specified in paragraph (f) of this section.

23.2.7 **Entry supervisor:** The person (such as the employer, foreman, or crew chief) responsible for determining if acceptable entry conditions are present at a permit space where entry is planned, for authorizing entry and overseeing entry operations, and for terminating entry as required by this section. An entry supervisor also may serve as an attendant or as an authorized entrant, as long as that person is trained and equipped as required for each role he or she fills. Also, the duties of entry supervisor may be passed from one individual to another during the course of an entry operation.

23.2.8 **Hazardous atmosphere:** An atmosphere that may expose employees to the risk of death, incapacitation, impairment of ability to self-rescue (that is, escape unaided from a permit space), injury, or acute illness from one or more of the following causes:

(1) Flammable gas, vapor, or mist in excess of 10 percent of its lower flammable limit (LFL);

(2) Airborne combustible dust at a concentration that meets or exceeds its LFL;

(3) Atmospheric oxygen concentration below 19.5 percent or above 23.5 percent;

(4) Atmospheric concentration of any substance for which a dose or a permissible exposure limit is published in Subpart G, Occupational Health and Environmental Control, or in Subpart Z, Toxic and Hazardous Substances, of 29 CFR 1910 and which could result in employee exposure in excess of its dose or permissible exposure limit;

(5) Any other atmospheric condition that is immediately dangerous to life or health.

23.2.9 **Immediately dangerous to life or health (IDLH):** Any condition that poses an immediate or delayed threat to life or that would cause irreversible adverse health effects or that would interfere with an individual's ability to escape unaided from a permit space. **(Note: in virtually all instances, spaces that are 10% LFL or below, may still be in excess of the IDLH for that substance.)**

23.2.10 **Oxygen deficient atmosphere:** An atmosphere containing less than 19.5 percent oxygen by volume.

23.2.11 **Oxygen enriched atmosphere:** An atmosphere containing more than 23.5 percent oxygen by volume.

23.2.12 **Permit-required confined space (permit space):** A confined space that has one or more of the following characteristics:

(1) Contains or has a potential to contain a hazardous atmosphere

(2) Contains a material that has the potential for engulfing an entrant

(3) Has an internal configuration such that an entrant could be trapped or asphyxiated by inwardly converging walls or by a floor which slopes downward and tapers to a smaller cross-section, or

(4) Contains any other recognized serious safety or health hazard

23.2.13 **Rescue service:** The personnel designated to rescue employees from permit spaces.

23.2.14 **Retrieval system:** The equipment (including a retrieval line, chest or full-body harness, wristlets, if appropriate, and a lifting device or anchor) used for non-entry rescue of persons from permit spaces.

23.2.15 **Testing:** The process by which the hazards that may confront entrants of a permit space are identified and evaluated. Testing includes specifying the tests that are to be performed in the permit space.

23.3 RESPONSIBILITIES

23.3.1 Attendants shall:

- Know the hazards that may be faced during entry in the permit-required confined space, including the signs, symptoms and consequences of over-exposure.
- Be aware of possible behavioral effects of hazard exposure to the entrants.
- Continuously maintain an accurate count of authorized entrants.
- Remain outside the permit-required confined space during entry operations until relieved by another attendant.
- Communicate with authorized entrants as necessary to monitor entrant status and to alert entrants of the need to evacuate the space if necessary.
- Monitor activities inside and outside the space to determine if it is safe for entrants to remain in the space and order the authorized entrants to evacuate the permit-required confined space immediately if necessary.
- Summon rescue and other emergency services if necessary.
- Take the appropriate actions when unauthorized persons approach or enter a permit space while entry is underway.
- Perform non-entry rescues as specified by this procedure
- Perform no duties that might interfere with the attendant's primary duty to monitor and protect the authorized entrants.

23.3.2 Authorized entrants shall:

- Know the hazards that may be faced during entry, including information on the route of entry, signs or symptoms, and consequences of the exposure.
- Properly use the required equipment.

- Communicate with the attendant, as necessary, to enable the attendant to monitor entrant status and to enable the attendant to alert entrants of the need to evacuate as necessary.

- Alert the attendant whenever the entrant recognizes any warning sign or symptom of exposure to a dangerous situation, or the entrant detects a prohibited condition.

- Exit from the permit-required confined space as quickly as possible whenever:

  (1) An order to evacuate is given by the attendant or the entry supervisor,

  (2) The entrant recognizes any warning sign or symptom of exposure to a dangerous situation,

  (3) The entrant detects a prohibited condition, or

  (4) An evacuation alarm is activated.

23.3.3 **Entry supervisors shall:**

- Know the hazards that may be faced during entry, including information on the routes of entry, signs or symptoms, and consequences of the exposure.

- Verify, by checking that the appropriate entries have been made on the permit, that all tests specified by the permit have been conducted and that all procedures and equipment specified by the permit are in place before endorsing the permit and allowing entry to begin.

- Terminate the entry and cancel the permit when entry operations covered by the permit are complete or when a prohibited condition arises in or near the space.

- Verify that rescue services are available and that the means for summoning them are operable.

- Remove, or have removed, unauthorized individuals who enter or who attempt to enter the permit-required confined space during entry operations.

- Determines that entry operations remain consistent with terms of the entry permit and that acceptable entry conditions are maintained.

23.4 RESCUE SERVICES

23.4.1 Rescue Plan

Prior to any confined space work, a site-specific written rescue plan will be developed that addresses minimum requirements. The rescue plan will be addressed on the confined space permit and covered with the entrants prior to initial entry.

23.4.2 Basic Rescue Requirements

23.4.2.1 NRCES Entry Supervisor shall ensure that at least one standby personnel at the site is trained and immediately available to perform rescue and emergency services.

23.4.2.2 A trained attendant will be assigned to each confined space with a fully charged SCBA or airline and egress unit in the event that monitoring indicates Oxygen deficient or atmospheres >PELs. The attendant is to keep life lines clear, to maintain contact with all workers within the confined space and to summon help if needed.

23.4.2.3 If Fire department rescue teams will be utilized, the supervisor must ensure that the rescue team has been contacted in advance and has the capability to perform a rescue. It should be understood, that the time required to recognize the need for rescue; contact the fire department and allow them to safely perform the rescue may require at least 45 minutes. For this reason, any rescue plan should be realistic. It should be noted that in may states or cities, FD rescue is not an option.

23.4.2.4 The equipment required to rescue an unconscious victim must be in-place before the first person enters the confined space. This means that personnel must be wearing harnesses; and rescue tripod /winch is set-up and operational.

23.4.2.5NRCES Entry Supervisor shall ensure that each member of the rescue service is provided with, and is trained to use properly, the personal protective equipment and rescue equipment necessary for making rescues from permit spaces.

23.4.2.6Training Requirements for Rescue Team Members

- Each member of the rescue service must have been trained to perform the assigned rescue duties.
- Each member of the rescue service must also receive the training required of authorized entrants.
- Each member of the rescue service must practice making permit space rescues at least once every 12 months by means of a simulated rescue operation (i.e. remove dummies, manikins or actual persons) from spaces representative of the type they may encounter.
- Each member of the rescue team shall be trained in basic first-aid, cardiopulmonary resuscitation. At least one member of the rescue service holding a current certification in First aid shall be available on the team.

23.4.3 **Entry Rescue Procedures**

23.4.3.1 Entry rescue procedures should be specifically designed for each permit-required confined space and should be included, where applicable, in the written site health and safety plan. The rescue plan shall:

- Include provisions for emergency communication.
- State how the rescue team and other emergency services will be summoned to the site.
- State what level of personal protective equipment is necessary for rescue operations.
- State what other types of equipment may be needed, including escape personal protective equipment for injured entrant(s), if necessary.

23.4.3.2 Attendants may perform entry rescue operations only if properly trained **and** if relieved of the attendant duties by another qualified attendant.

23.4.4 Non-entry Rescue Procedures

23.4.4.1 Non-entry rescue operations shall be facilitated as much as possible in order to decrease the risks associated with emergency entry into a confined space. All company attendants shall be trained to perform non-entry procedures.

23.4.4.2 Retrieval systems or methods shall be used for all entries into permit-required confined spaces unless the retrieval system would increase the overall risk of the entry or would not work adequately in the space being entered.

23.4.4.3 Retrieval systems shall consist of chest or body harnesses with a retrieval line attached to the center of the entrant's back, near shoulder level. The retrieval line shall be attached to either a fixed point or, for spaces more than five feet deep, a mechanical device. The fixed point or mechanical device shall be located outside the confined space.

23.4.4.4 Wristlets may be used in lieu of the chest or full body harness if it can be demonstrated that the use of a chest or full body harness is infeasible or creates a hazard and that the use of wristlets is the saNRCESt and most effective alternative.

23.5 CONFINED SPACE ENTRY PROCEDURE

23.5.1 Permit System

23.5.1.1 All "permit required confined space" entries will be preceded by the completion of a confined space entry permit.

23.5.1.2 All confined space entry permits will address the following:

- Location
- Past and present contents of the tank

- Hazards Isolation
- Lockout / Tagout
- PPE and special equipment
- Air monitoring requirements and results of such monitoring
- Personal monitoring
- Training required
- Attendants to be present as alternates
- Communication procedures
- Emergency / rescue procedures
- Confined space classification
- Posting of notification

23.5.2Training

NRCES will train employees involved in confined space entry, confined space rescue and the hazards associated with confined space work. This training will, as a minimum, cover the following:

- Hazard recognition
- Air monitoring, capabilities and limitations
- Emergency entry and exit
- Respirator use
- First aid
- Lock-out procedures
- Safety equipment

- Rescue drills
- Permit system
- Work practices
- Communication requirements

23.5.3 Atmospheric Testing and Monitoring

23.5.3.1 Initial Monitoring - Entry into a confined space is prohibited until initial monitoring of the atmosphere for oxygen content and toxic gas concentration is conducted from the outside. Initial monitoring gives critical information concerning oxygen level, flammability and toxicity hazards.

23.5.3.2 Hot Work - All hot work is prohibited in confined spaces in which monitoring indicates that there are flammable compounds in excess of 10% of the Lower Explosive Limit (LEL). The monitoring device must be intrinsically safe for flammable atmospheres or explosion proof. If hot work must be performed in the confined space, a hot work permit must be completed. Cutting gas cylinders and welding machines will not be taken into confined space.

23.5.3.3 Calibration - All monitoring equipment will be calibrated before each use and those calibrations will be logged in the equipment records. The calibration record will be kept for a minimum of one year from the date of measurement. In addition, the response charts associated with the calibration gas will be kept with the CGI at all times.

23.5.3.4 Oxygen Requirement - The percent oxygen for entry will not be less than 19.5% for confined space entry unless supplied air respirators are utilized. If oxygen levels are greater than 22%, the confined space must be ventilated prior to any "hot work." Any oxygen reading above or below 20.9% will be reported to the project manager before further entry is attempted. IN the event of deficient oxygen, the tank will be ventilated until such time as the level of O2 is brought up to 20.9%

23.5.3.5 Permissible Exposure Limits (PEL) - NRCES employees will be provided with and will be required to properly use protective

clothing and respiratory protective equipment when contaminants in the atmosphere reach or exceed the PEL. The personal protective equipment (PPE) selected will reduce exposure to contaminants to acceptable levels.

23.5.4 Labeling and Posting

23.5.4.1 Any signs warning of dangers in the work area will be in English and the predominant language of any non-English reading workers.

23.5.4.2 All entrances to confined spaces at NRCES facilities and on-going projects will have appropriate signs posted. The signs should include the following, if applicable:

Danger
Confined Space
Entry by Permit Only

The following statements shall be added where necessary:

Respirator Required for Entry
Lifeline Required for Entry
Hot Work Permitted

or

No Hot Work

23.5.4.3 Emergency numbers will be conspicuously posted near the work area or at the telephone nearest the work area.

23.5.5 Safety Equipment and PPE

The project manager or site supervisor shall determine, and list on the confined space permit, the necessary safety equipment and PPE. The site supervisor will ensure that the safety equipment is properly used and is maintained in the proper working condition. These items may include, but are not limited to:

- Eye / face protection
- Head protection
- Foot protection
- Protective clothing
- Hearing protection
- Respiratory protection
- Safety bells/Alarms
- Harnesses
- Lifelines
- Wrist harnesses
- Life jackets
- Fall nets
- Barricades
- Retrieval systems

23.5.6 Work Practices

23.5.6.1 Purge and Ventilation - During purge and ventilation procedures, blower controls will be a safe distance from the confined space. Initial testing is to be conducted prior to purge/ventilation to determine what precautions are necessary. If a flammable atmosphere exists, all electrical equipment must be intrinsically safe or explosion proof. Continuous ventilation will be required when welding or painting in a confined space, or where a toxic atmosphere may form from desorption from walls, or evaporation of chemicals. Ventilation systems must not prevent egress from the area or interfere with communications.

23.5.6.2 Exhaust of Confined Space Gases – duct work will be installed on the exhaust outlet for the confined space to insure that any purged gases are directed away from work/decon/support or ignition source areas.

23.5.6.3 Bonding/Grounding – all ventilation equipment will be bonded and grounded to isolate and remove the potential static discharge.

23.5.6.4Isolation / Lock-out / Tag-out - Each confined space will have isolation procedures specifically developed. The confined space must be completely isolated from all systems by physical disconnect, block and bleed, or blanking and tagging. Electrical systems must be de-energized and locked out. All systems should be checked for stored energy before any entry into confined space is attempted.

23.5.6.5Cleaning - Cleaning procedures will be reviewed and approved by the qualified person. Initial cleaning will be conducted from outside the tank whenever possible to minimize exposures to employees. Cleaning may be accomplished by flushing with water or chemical cleaners. At times the use of a "Butterworth" cleaning head may be required. In any case, the cleaning method must be reviewed before entry is performed.

23.5.7 Equipment and Tools

All equipment that is used in confined space will be inspected and as a minimum, will meet the following requirements:

- Hand tools will be kept clean and in proper working condition.
- Electric tools, equipment and lighting will be intrinsically safe or explosion proof for flammable atmospheres and be equipped with ground fault circuits interrupters (GFCI).
- Extension cords will be industrial quality, 3 wire and 12 gauge as a minimum.
- With the exception of SCBA tanks or life saving equipment, compressed gas cylinders will never be taken into a confined space,.

- Ladder and scaffolding will meet or exceed OSHA requirements contained in 29 CFR 1910.25-28.

32.0 Forklifts (Powered Industrial Trucks)

32.1 PURPOSE

The purpose of this procedure is to describe the requirements for the inspection use and maintenance of forklifts (and other powered industrial trucks). This procedure is based upon the requirements of 29 CFR 1910.178 and standard safe operating practices. NRC personnel who operate forklifts and other powered industrial trucks must be specifically qualified and trained in their inspection, maintenance, and safe operation.

32.2 GENERAL REQUIREMENTS

32.2.1 All forklifts used at the decontamination facilities and project sites must meet the design and construction requirements of the American National Standards Institute (ANSI) standard B-56.1 - 1969 "Standard for Powered Industrial Trucks, Part II" and bear a plate indicating compliance with this standard. No modifications shall be made to the forklift except by the manufacturer.

32.2.2 Forklifts used in hazardous locations should be appropriate for that hazardous location. The OSHA regulations contained in 29 CFR 1910.178 outline the requirements for forklifts used in potentially flammable or combustible atmospheres, confined spaces, or in general use. For general use in non-hazardous areas, industrial trucks designated by the manufacturer as Type D, E, G, or LP may be used (as approved for intended use by a nationally recognized testing laboratory). In Class I, Division I locations, only "EX" designated trucks will be used. In Class I, Division II locations, only "EX", "EE" or "DS" trucks may be used.

32.2.3 Fuel handling and storage shall be in accordance with the National Fire Protection Association (NFPA) standard 58 - 1969 for liquefied petroleum gas and 29 CFR 1910.178 (f). If batteries are used as power, battery changing and storage shall be as required in 29 CFR 1910.178 (g).

32.2.4 The rated lifting capacity of the forklift must appear in a prominent location.

32.2.5 Forklift trucks shall be fitted with overhead guards and flashing lights.

32.2.6 Spinner knobs on steering wheels are prohibited.

32.3 OPERATING REQUIREMENTS

32.3.1 Lighting in operating areas shall be adequate (at least 2 lumens per square foot). If lighting is not adequate the forklift most be provided with auxiliary directional lighting.

32.3.2 Care shall be exercised inside buildings to ensure that internal combustion forklifts do not create a hazard from carbon monoxide.

32.3.3 Only trained and authorized operators shall be allowed to operate forklifts. A forklift training program has been devised by the Corporate Health and Safety Manager for operators in each region. Contractor personnel must also be trained and qualified and must present FEIS with appropriate written documentation prior to truck operation.

32.3.4 Operators shall perform "pre-use" inspections of the forklift to be operated. The "pre-use" inspections shall be performed each shift that the forklift is operated. All inspection discrepancies must be corrected prior to operation of the forklift. The "Forklift Pre-Use Inspection Sheet" is contained in the appendix of this manual. If the discrepancy can not be corrected immediately, the forklift must be tagged out of service.

32.4 FORKLIFT OPERATION

32.4.1 When a forklift is left unattended, the load shall be fully lowered, controls neutralized, power shut off, and brake set. The wheels must be chocked if parked on an incline. A forklift is unattended when the operator is more that 25 feet away, or out of view of the forklift. Forklifts shall not be parked where they obstruct aisles, stairways, or fire protection equipment.

32.4.2 If loading or unloading by forklift from trucks, freight cars, or other wheeled vehicles, the wheels of the vehicle being unloaded must be chocked to prevent movement.

32.4.3 Forklifts shall not be used to lift personnel.

32.4.4 Face the direction of travel at all times when you operate the forklift; do not go over the speed limit; and travel with the forks carried as low as possible.

32.4.5 Give pedestrians the right-of-way. Warn them with your horn well ahead of time. Be alert at intersections. Sound the horn and move ahead cautiously at blind corners. Come to a full stop before you go through a doorway.

32.4.6 Stay a safe distance behind other vehicles. Under normal conditions, three truck lengths are safe.

32.4.7 When ascending or descending grades in excess of 10 percent, always drive with the load upgrade. Drive slowly and cautiously when proceeding down ramps to allow yourself enough room to stop.

32.4.8 Watch out for storage racks, stock and other obstacles when you raise or lower a load.

32.4.9 Look behind you before you back up.

32.4.10 Check the load capacity of floors, elevators, trucks and trailers. Be sure they can handle the weight of your forklift and the load.

32.4.11 Keep your arms, legs and other body parts inside the operator's compartment at all times. Do not reach between the mast arms to turn off the key or to move the forks. Do not remove guards on your forklift.

32.4.12 Do not exceed the load capacity of your forklift. If the load is too heavy, it may damage the vehicle, make it hard to steer, or cause the forklift to tip forward or overturn.

32.4.13 When you carry a load, make sure it rests against the carriage. Keep the mast of the forklift tilted backward to hold the load in place. Lift and lower loads slowly and avoid sudden movements.

32.4.14 For proper balance and stability, position forks all the way into the load. Also, adjust forks to the width of the load.

32.4.15 Do not lift loads with only one fork.

32.4.16 Do not push heavy loads with a forklift.

32.4.17 Do not carry passengers on your forklift or lift anyone on the forks except in an approved safety platform.

32.4.18 Wear the proper personal protective equipment when operating a forklift.

32.4.19 Do not take part in stunt driving or horseplay.

32.4.20 Never stand or pass under elevated forks.

32.4.21 Refuel forklifts at locations specifically designed for that purpose and pay attention to posted instructions. Refueling locations should be

well-ventilated and at least 10 feet from all sources of ignition. Forklifts must have at least a 2½ lb ABC dry chemical fire extinguisher attached.

32.4.22 Never elevate the forks when you travel, turn or move the truck into position.

32.4.23 Park at safe distances from the edges of all ramps and platforms.

32.4.24 Forklift safety rules shall be posted in the areas in which forklifts are being operated.

36.0 Safety Showers and Eyewash Stations

36.1 PURPOSE

This procedure describes the types and locations of safety showers and eyewash stations to address the requirements found in 29 CFR 1910.151(c) and the American National Standards ANSI Z358.1-1990 for emergency eyewash and shower equipment. It is the policy of NRC to provide suitable facilities for quick drenching or flushing of the eyes and body within the work area when employees may be exposed to hazardous chemicals.

36.2 REQUIREMENTS

36.2.1 Eyewash stations shall be located throughout the decon facilities and jobsites for emergency first aid in the event of chemical splashes to the eyes and skin. The general requirements for emergency eyewash stations are as follows:

- In general when a chemical exposure occurs to the eyes, they should be flushed immediately for a minimum of 10 minutes. Flush both eyes simultaneously.
- Eyewash units shall be in an accessible location, located no further than 100 feet from the hazard. Where strong caustics or acids are present, the travel distance should be 10 feet or less.
- Identify the location of the eyewash station with a highly visible sign in a well-lighted area.
- Eyewash unit shall be positioned so that the water nozzles are 33-45 inches from the floor and 6 or more inches from the wall
- The supply line for plumbed units shall provide an uninterrupted supply of potable water at a minimum of 30 lbs. per square inch of pressure.
- Eyewash units shall deliver not less than 0.4 gpm for 15 minutes.
- Provide freeze protection of the eyewash station when the possibility of freezing conditions exist.
- There shall be no sharp projections in operating area of unit.
- The nozzles must have quickly removable caps to protect them from airborne contaminants.

- Self-contained units shall be constructed of materials that will not corrode in the presence of flushing fluid.

- The valves must have "stay open" feature allowing both hands free to open eyelids.
- The valves must be capable of being turned on in 1 second or less.
- The valve activator shall be large enough to be easily located and operated by user.

36.2.2 Safety showers shall be located throughout company facilities and jobsites for emergency first aid in the event of chemical splashes to the face, head and/or body. The general requirements for safety showers are as follows:

- The height of the safety shower head should be at least 82 inches and not more than 96 inches from standing level.
- The water spray pattern should be a minimum of 20 inches in diameter, 60 inches from standing level.
- The center of the water spray should be at least 16 inches from any obstruction.

- The safety shower should deliver 30 gallons of water per minute, meeting the water spray pattern.

- Provide freeze protection of the safety shower when the possibility of freezing conditions exist.

- The control valve should stay on once activated, and should be able to be activated from "off" to "on" in one second.

- Safety showers should be located the closer of no more than 10 seconds or 100 feet from the hazard. In situations where strong caustics or acids are present, the distance should be 10 feet or less.

- The safety shower should be identified with a sign and should be located in a well lit, brightly painted area.

36.2.3 In order to ensure proper working conditions, all safety showers and eyewash stations must be inspected on a weekly basis. Records of these inspections should be kept on the device. Substandard conditions must be repaired immediately.

All safety showers and plumbed eyewash stations must also be tested as part of the inspection. For eyewash stations that are not plumbed, the water should also be checked and replaced per the manufacturer's instructions. Trash or debris should be removed from any eyewash basins.

APPENDIX C

SAFETY MESSAGE, DECEMBER 2, 2004

SAFE USE OF PRESSURE WASHERS AND STEAM CLEANERS

SAFE USE OF PRESSURE WASHERS AND STEAM CLEANERS

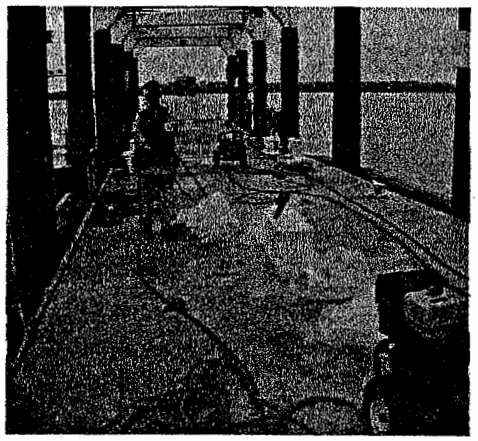
Work to Be Done: Removal of contaminants from equipment, shoreline, piers, and similar structures.

Equipment: Steam cleaners, and pressure washers powered by internal combustion engines.

Site Description: Various types of work surfaces, rocks, sand, oily surfaces.

Potential Hazards: Slips, trips, falls, steam burns, injuries from excess pressure, excessive noise, injuries from hot surfaces on the hotsy or pressure washers, insect and animal bites, and potential drowning.

Special notes: All personnel should adhere to the following precautions with steam cleaners and pressure washers:



- All personnel will wear proper personal protective equipment when working operating the steam or pressure wands or assisting personnel using this equipment. This will include Tyvek coveralls, rubber boots, nitrile or neoprene gloves, **face shield with clear or tinted safety glasses with side shields under the shield**.
- All personnel working around pressure washers or steam cleaners must, at a minimum, wear regular safety glasses.
- **Equipment operators should never direct the power spray of the wand to themselves or other personnel.** Steam washers are for decontamination of equipment only. Personal Protective Equipment should not be washed or decontaminated by using steam or power washers.
- Prior to starting the equipment caution should be exercised when filling the tank with gasoline. No smoking will be allowed in the area while equipment is being refueled. Prior to startup all hoses and wand should be connected and rechecked to ensure the connections are secure.
- All supply and wand hoses should be free of kinks and where possible secured to not present a tripping hazard to other personnel.
- Operators should be cautious when using the rope pull to start the engine. Wet hands, slippery hands, pulls or frayed pull rope can lead to injury.
- Operators should ensure that personnel in the area are a safe distance from the wand and equipment operations.
- Noise surveys should be taken to check noise exposure to workers. Generally personnel working on or within 5 feet of steam or pressure should wear hearing protection.
- When working near water, Personal Flotation Devices (PFD's) must be worn.
- Contaminated areas, where personnel are working, should be marked and barricaded, and the surface covered to prevent spread of contamination. NOTE: If plastic is used for coverage of the surfaces, personnel must exercise care when walking on the plastic surfaces as they can become slick with a combination of contaminant and water. The wearing of rubber oil resistant non-skid boots or the use of cloth covering on the surface instead of plastic is preferable.
- Wand levers should always be held and triggered by the operator's hand. At no time should the lever be wired or taped in the open position.

Overview

The Marina Decontamination Procedure is applicable to decontamination of marinas at multiple locations throughout the Delaware River Valley as required. Individual operations will be sized to effectively meet site-specific needs.

All operations will be conducted in accordance with the site safety plan. Proper PPE appropriate for the operations being conducted including PFDs will be worn in an approved manner.

All decontamination operations will depend on weather conditions. Severe weather will require cancellation of operations until operations can be conducted safely in accordance with the site safety plan.

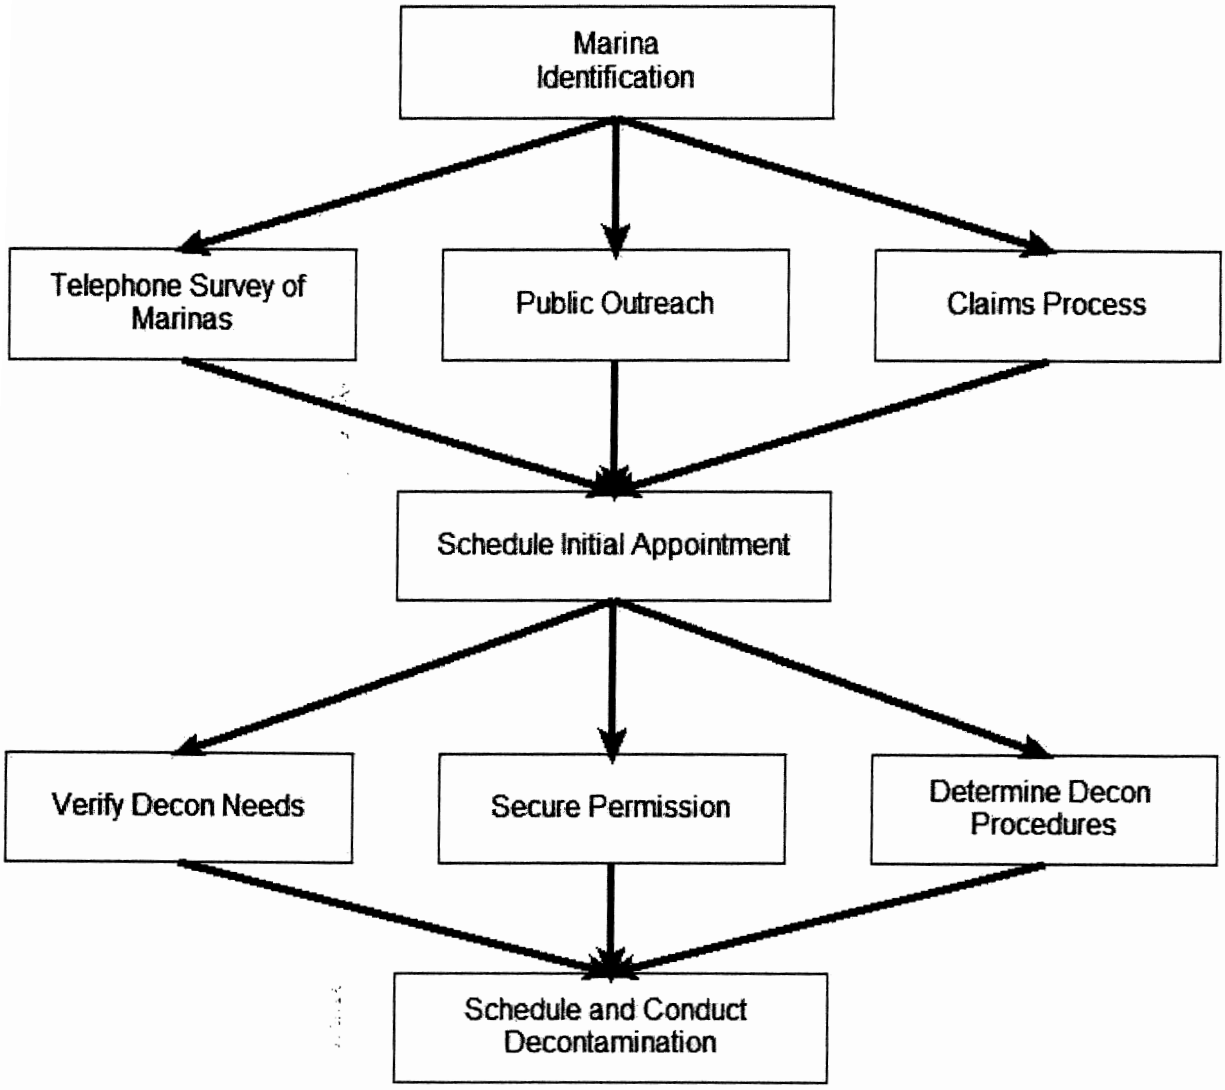
Marina Decontamination Procedures

Marina Decontamination Flow Diagram



Marina Identification

The Delaware River Valley is an important area for both commercial and recreational users. The Athos I incident has impacted both categories of users. Commercial activities are a year round operation. Recreational activities slow down during the fall and winter seasons.

The decontamination of commercial activities is the subject of separate plans and procedures.

The O'Brien's Group under the guidance and direction of the Unified Command has pursued an aggressive effort to identify, examine and develop procedures for the decontamination of recreational facilities. Recreational boat decontamination operations are currently proceeding in accordance with other plans. This plan for decontamination of marinas was developed to ensure that the marinas are prepared to open the spring season.

As required by OPA90, Hudson Marine Management Services (HMMS) advertised the claims phone number (866-401-0353) in six (6) newspapers covering the impacted area. This generated a number of claims inquiries for marinas that were then communicated to the O'Brien's Group.

In a parallel effort, marinas in the area were contacted by the O'Brien's Group via telephone to identify if the marinas and boat owners are aware of the claims phone number (866-401-0353). This also served to start the process for the boat and marina decontamination procedure.

In addition, O'Brien's personnel, in the normal course of their duties while directing other decontamination operations, met with boat owners, marina owners and other interested citizens to develop listings of marinas. The O'Brien's Group personnel also met with marina and yacht club owner/operators at different community outreach and town hall meetings.

Schedule Appointment

From the contacts developed above, The O'Brien's Group personnel will schedule an appointment with each marina owner/operator to verify and identify the following:

1. Impact on the marina resulting from the incident. This includes identifying the portion of the marina that was impacted and the extent of the impact.

2. If the marina was impacted, what steps have been taken by the marina owner/operator with regard to personal insurance claims and filing claims with HMMS.

3. The decontamination procedures to be implemented.

4. Permission necessary from the owner/operator to access the marina property and commence decontamination operations.

5. Any special conditions applicable to the marina.

Schedule Decontamination

Based on the weather conditions and available personnel and equipment resources, decontamination of the marina will be scheduled. The marina owner/operator will be contacted and informed of the decontamination schedule. Note it may not be possible to complete a marina in a single period of time. In any case the owner/operator will be kept informed.

Decontamination Procedures

General

In most cases, decontamination will be accomplished with high-pressure washers. In all cases a test will be conducted prior to full decontamination. If necessary, approved and permitted cleaning agents may be used in this process. The usage shall be in the minimum amount necessary and in accordance with application guidelines.

All contaminated debris and sludge resulting from the decontamination process, will be collected, removed from the water and disposed of in an approved manner. Waste minimization practices will be followed in all cases.

The below procedures are applicable to the three general portions of a typical marina (bulkheads/sea walls, floating and fixed dock structures and pilings). They may be modified to more properly reflect the actual conditions at the individual marina.

Decontamination standards will comply with the "end points" document approved by the Unified Command.

Bulkheads/Sea Walls

Every effort will be made to prevent overspray or additional contamination of surrounding areas due to the decontamination operations. The following procedures will be followed in the decontamination of bulkheads and sea walls:

1. A temporary plywood wall will be erected between the bulkhead/sea wall and the surrounding area.
2. Hard boom, lined with sausage boom, will be placed at the base of the bulkhead/sea wall.
3. A small area of the bulkhead/sea wall will be tested to determine the best technique for decontamination. The test will be carefully observed to determine if adjustments are necessary to prevent overspray.
4. As each area of the bulkhead/sea wall is decontaminated, all soiled sausage boom and other materials will be collected and disposed of in an approved manner. Dislodged contaminated material will be collected with sorbent pads as necessary. The temporary plywood wall will be moved along the bulkhead/seawall and the procedure repeated as necessary.

Floating/fixed dock structures

Every effort will be made to prevent overspray or additional contamination of surrounding areas due to the decontamination operations. The following procedures will be followed in the decontamination of floating/fixed dock structures:

1. Hard boom, lined with sausage boom, will be placed around the floating/fixed dock structure.
2. A small area of the floating/fixed dock structure will be tested to determine the best technique for decontamination. The test will be carefully observed to determine if adjustments are necessary to prevent overspray. In addition, the floatation will be carefully examined to prevent damage.
3. Particular attention shall be paid to the underside of the floating/fixed dock structure and connecting wiring and piping to prevent damage.
4. As each area of the floating/fixed dock structure is decontaminated, all soiled sausage boom and other materials will be collected and disposed of in an approved manner. Dislodged contaminated material will be collected with sorbent pads as necessary.
5. The procedures will be repeated as each section of floating/fixed dock structure is decontaminated.

Pilings

Every effort will be made to prevent overspray or additional contamination of surrounding areas due to the decontamination operations. The following procedures will be followed in the decontamination of the pilings:

1. Hard boom, lined with sausage boom, will be placed around the pilings.
2. A small area of the pilings will be tested to determine the best technique for decontamination. The test will be carefully observed to determine if adjustments are necessary to prevent overspray.
3. Particular attention shall be paid to rollers and sliding mechanisms on the pilings that move with the tide to insure that they are decontaminated and free of debris.
4. As each area of the pilings is decontaminated, all soiled sausage boom and other materials will be collected and disposed of in an approved manner. Dislodged contaminated material will be collected with sorbent pads as necessary.
5. The procedures will be repeated as each section of piling structure is decontaminated

Decontamination Closure

A TOG claims adjuster(s) will be present during decontamination operations and will consult with the marina owner/operator to close each decontamination request.

All day-to-day scheduling, direction, supervision of decontamination operations, and closing of claims will be under the responsibility and supervision of The O'Brien's Group. Necessary work force levels will be determined by The O'Brien's Group.

Situation Status

The Claims Unit will provide a daily update of Marina Decontamination Activity. The daily update will include the following information:

Location(s) of decontamination activity
Decontamination activities underway
Percentage of decontamination completed.

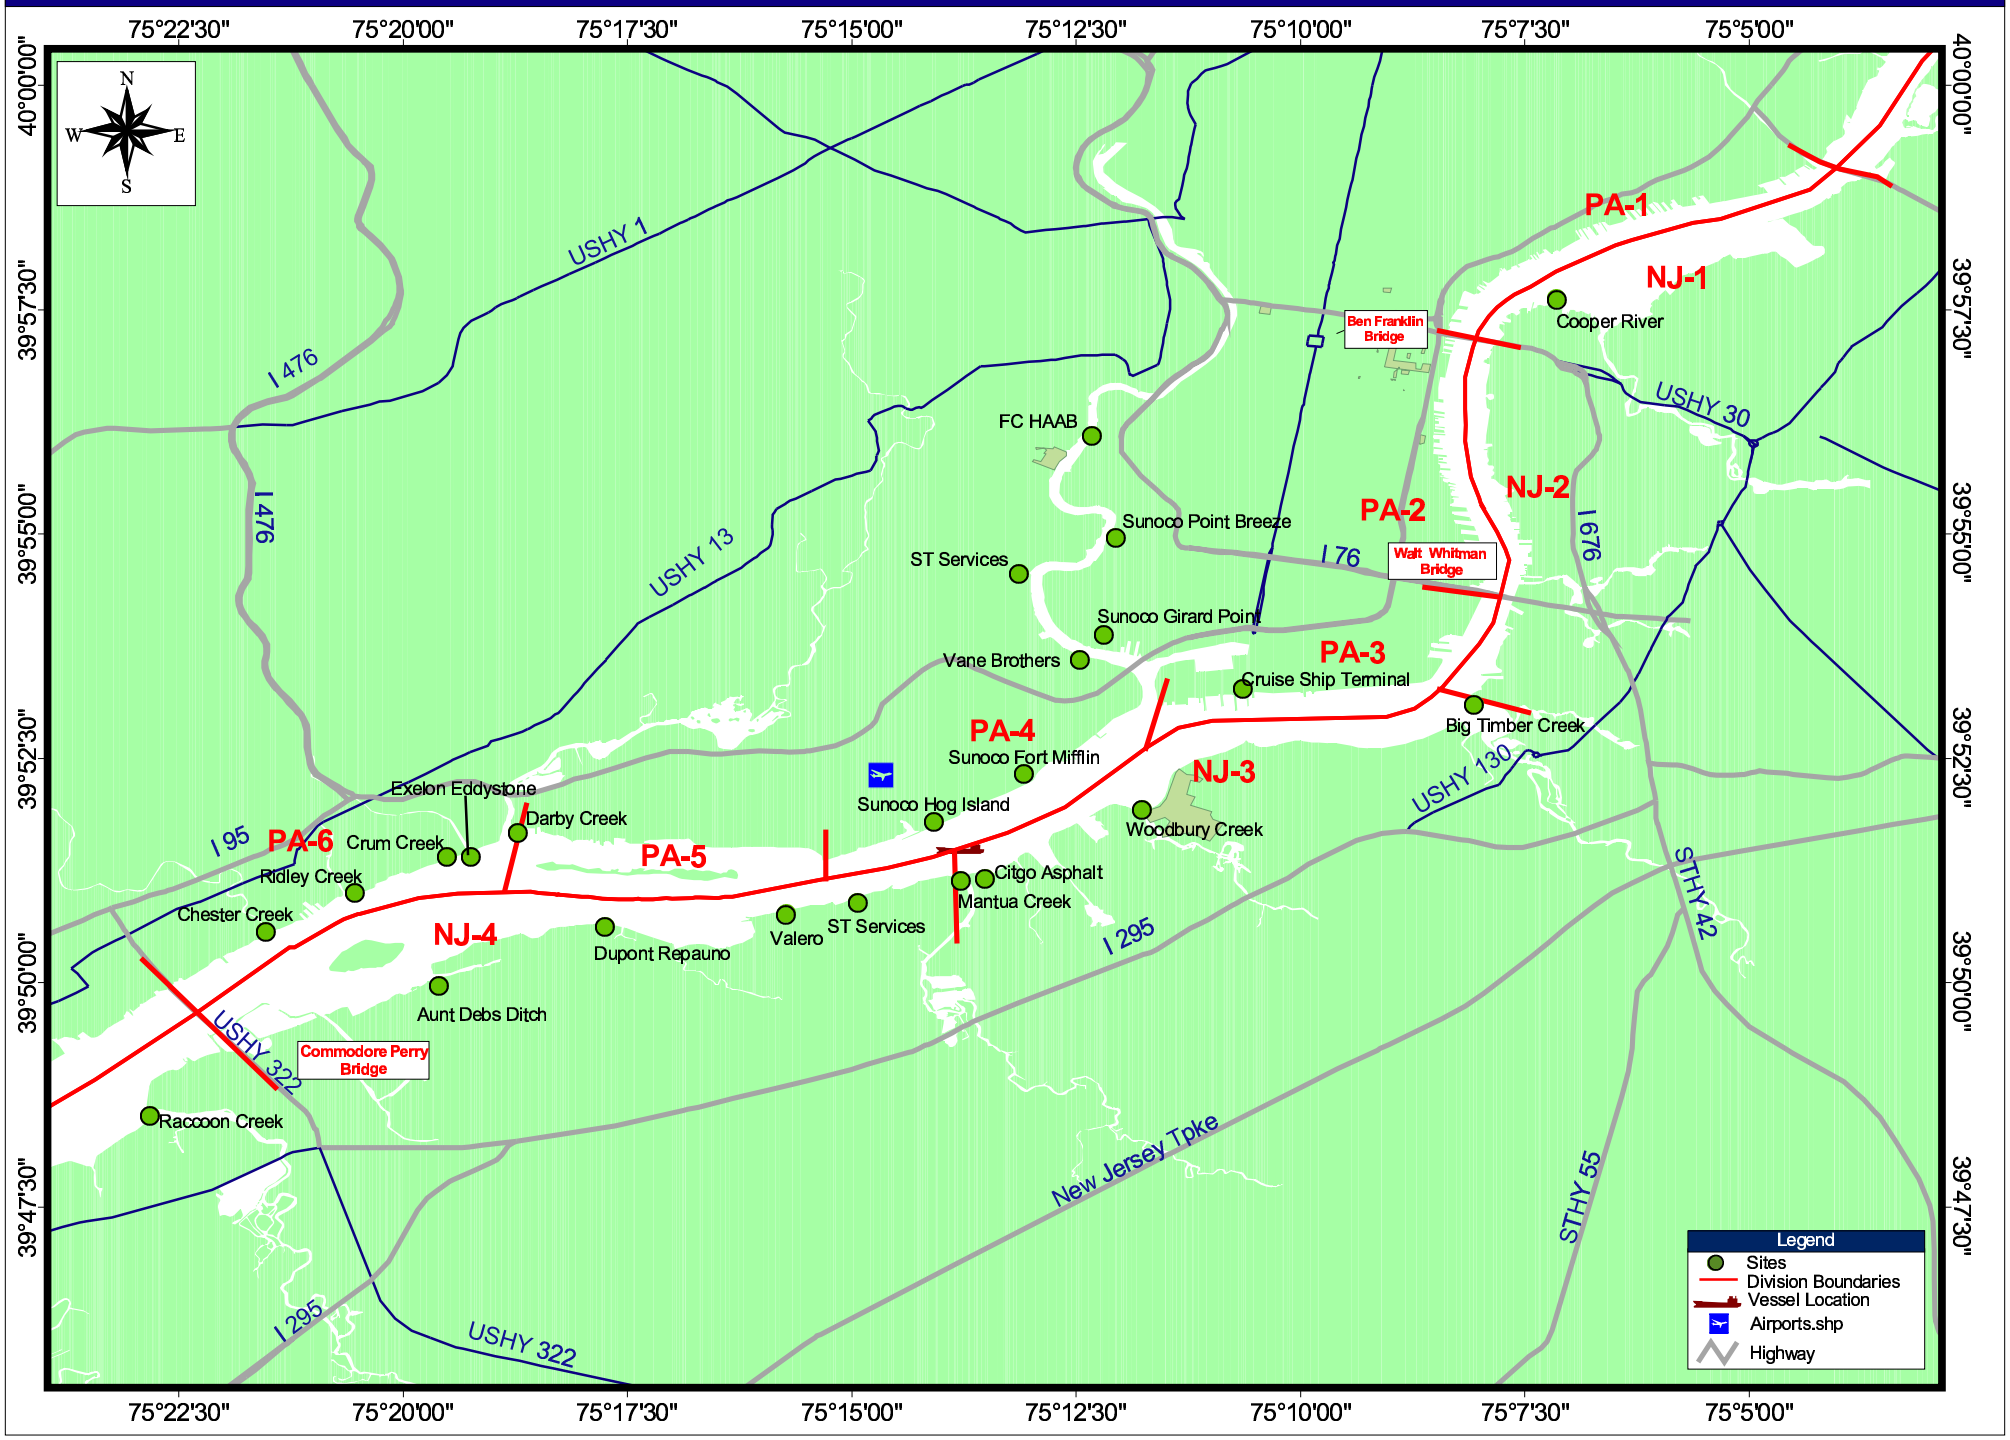
The Response Group
Emergency Response Pre-Planning & Support



ICS 202 - General Response Objectives

Incident:	MV Athos I	**Prepared By:**	Section, Planning **at** 11/28/2004 11:43
Period:	Period 3 (11/29/2004 06:00 - 11/30/2004 06:00)	**Version Name:**	Unified Command Objectives

Overall and Tactical Objectives

	Assigned To	Status
Conduct shoreline cleanup assessment operations.		
Stabilize vessel & take corrective action through implementation of salvage plan.		
Monitor exiting sensitive site booming strategies & implement additional strategies as appropriate.		
Collect and recover free-floating oil.		
Collect and recover injured wildlife.		
Implement decon plan (including decon of commercial and recreational vessels, personnel and equipment).		
Continue to enforce safety zone.		
Implement vessel transit protocols to facilitate vessel movement in effective port areas, as possible.		
Continue to keep state holders and public informed.		
Conduct operations I.A.W. safe work practices.

ICS 204 - Assignment List

Incident:	MV Athos I	**Branch:**	Recovery & Protection Branch
Period:	Period 3 (11/29/2004 06:00 - 11/30/2004 06:00)	**Division/Group:**	Debris Group
Prepared By Signature:		**Task Force:**	
Approved By Signature:			

Operations Personnel

Title	Person	Radio	Phone	Pager
Operations Section Chief	Theo Camlin		425-501-5430	
Operations Section Deputy	V. Huyck/Jamie Bethard		215-778-5453	
Division/Group Supervisor				
Safety Officer	Bud Kline		985-960-0585	

Resources Required

Area of Operation	Resource Type	Description	Quantity	Size
Debris Group	Manpower: Responder	Laborers	12 each	
Debris Group	Manpower: Supervisor	Supervisors	1 each	
Debris Group	Roll Off Box	Roll Off Boxes	12 each	
Debris Group	Vehicle	Crew Trucks	3 each	

Assignments

Pre-shoreline cleanup down river beyond PA-6 and NJ-4.
1. Ensure protective measures are adequate if not supplement.
2. Report pooled oil or heavily impacted shoreline areas to the Situation Unit Leader by 0400hrs., 1300hrs, and 1600hrs. at 271-4909

Special Environmental Considerations

CUT NO GRASSES WITHOUT SCAT TEAM APPROVAL. REPORT OILED WILDLIFE TO SITUATION UNIT

Special Site-Specific Safety Considerations

REVIEW SITE SAFETY PLAN(CONTRACTORS) WITH SPECIAL ATTENTION TO PPE, SLIPS, AND TRIPS & FALLS.
ALL PERSONNEL ARE REQUIRED TO FOLLOW DECON PROCEDURES IN SITE SAFETY PLAN.

Delaware Bay & River COOF	Boom	Bottom Seal - BT- 91	150 feet	20 inch(es)	Assigned

Assignments

Monitor & maintain deployed boom at site. Assure it's effectiveness.

Description of Work

Oldmans Creek is difficult to locate while traveling downstream on the Delaware River because of the angle with which its mouth opens towards downstream. Its mouth is characterized by dredge spoil deposits on both shores. Tidal flats exist upstream of the Rt. 130 Bridge. There are two launching areas at the Gateway Truck Terminal on Rt. 130 south in Oldmans Township. The boom is stored at Sunoco Marcus Hook. Land access to the mouth is possible via the US Army Corps of Engineers dirt road off of Rt. 130 approximately 2 miles south of Oldmans Creek drawbridge.

Location of Work

NJ 76.97
Access:Water

Delaware Bay & River COOF	Boom	American Marine Boo	1400 feet	12 inch(es)	Assigned
Delaware Bay & River COOF	Boom	Bottom Seal - SV-62(	300 feet	20 inch(es)	Assigned

Assignments

Monitor & maintain deployed boom at site. Assure it's effectiveness.

Description of Work

Raccoon Creek has a relatively wide mouth at the Delaware River. The upstream side rises from the Delaware due to deposits of dredge spoil. The downstream side is characterized by old bulkheading and pilings which are just visible at high water. Tidal flats exist just upstream of the Rt. 130 Bridge. There is no land access to the mouth. Access is off of Rt. 130, Bridgeport. The boom is stored at the Tosco Refinery. Installation of the shore seal boom must be done quickly due to the narrow tide window and very shallow water. Hip waders are necessary for the down river deployment. A second scenario is not shown. The closest place an attempt might be made is where the Rt. 130 bridge crosses Raccoon Creek.

Location of Work

NJ 80.66
Access:Water

Assignments

Monitor & maintain deployed boom at site. Assure it's effectiveness.

Description of Work

Aunt Debs Ditch is a narrow channel between Monds Island and the New Jersey river bank. It is open only on the south end.. There is an access road to the boom site and a small jon boat can be launched from a bridge on the access road. Recovery of oil can be accomplished using a vacuum truck.

Location of Work

NJ 85.35
Access:Water/Land

Assignments

Monitor & maintain deployed boom at site. Assure it's effectiveness.

Description of Work

The mouth of Darby Creek opens into a wide cove. Upstream of the mouth are two railroad bridges, the Rt. 291 Bridge and the I-95 Bridge. Upstream marshes on Darby Creek are very sensitive and are considered of great value. The John Heinz National Wildlife Refuge is located on Darby Creek. A series of collection booms can be run between the railroad bridges and the Rt. 291 Bridge. A removal effort will need to be mounted here. The boom is stored at EXCELON Eddystone.

ICS 223 - Health and Safety Message

Incident:	MV Athos I	**Prepared By:**	Section, Safety	**at** 11/29/2004 18:00
Period:	Period 3 (11/29/2004 06:00 - 11/30/2004 06:00)	**Version Name:**	November 29, 2004	

Major Hazards and Risks

Potential Hazards: Slippery and uneven surfaces; exposure to weathered oil; cold/heat exposure, slips, trips and falls; and boat operations.

Narrative

Site Description: On-Water & Shoreline Cleanup Activities

Potential Hazards: Slippery and uneven surfaces; exposure to weathered oil; cold/heat exposure, slips, trips and falls; and boat operations.

General Safety Concerns:

ADHERANCE TO ALL PPE REQUIREMENTS

Level D (no known hazards) For Exclusion/Safety Zone Operations involving oil removal operations

- Tyvek-type and/or rain gear
- Hard hat when overhead hazards exist
- Safety glasses/ goggles/ face shield
- Work shoes
- Disposable boots
- Chemical resistant gloves
- Hearing protection

Special Notes -

In the event clean up activities involve entry to industrial/ commercial facilities, safety rules of the facility will apply as long as the safety rules do not contradict this plan.

ALL INJURIES REGARDLESS OF SEVERITY MUST BE REPORTED TO THE OPERATIONS CENTER AT 215-271-4911 AND SAFETY IMMEDIATELY AND AN INCIDENT REPORT MUST BE FORWARDED VIA THE FIELD SAFETY REPRESENTATIVE

In the event of a non-life threatening emergency the patient should, if possible, be transported out of the hot zone and decontaminated as much as possible. In life threatening emergencies, where a patient cannot be moved, ambulance personnel will respond into the hot zone properly attired. A second ambulance will be dispatched to transport.

ALL PERSONNEL VISITING THE EXCLUSION ZONE MUST BE WEARING THE APPROPRIATE PPE - NO SNEAKERS ALLOWED.

Oil Recovery Branch Director	Nelson Fettgetter		713-569-9304	
Safety Officer	Ed Doyle		302-993-9081	

Resources Required

Area of Operation	Resource Type	Description	Quantity	Size
NJ-4 Division	Boom	Boom	6100 feet	
NJ-4 Division	Manpower: Responder	Labor Tech	50 each	
NJ-4 Division	Manpower: Supervisor	Fish and Wildlife Rep	1 each	
NJ-4 Division	Manpower: Supervisor	Supervisor	1 each	
NJ-4 Division	Manpower: Supervisor	NSF Reps	2 each	
NJ-4 Division	Pressure Washers / Wash	Pumps	2 each	
NJ-4 Division	Skimmer	Skimmer Unit	2 each	
NJ-4 Division	Vacuum Transfer Unit	VTU	2 each	
NJ-4 Division	Vessel	Greater than 21'	1 each	
NJ-4 Division	Vessel	Less than 21'	2 each	

Assignments

-Manually recover oil and oil coated debris.
-Employ and assess effectiveness of various techniques:
  -Low pressure flushing
  -Squigees
  -Snares
  -Vacuum Unit
-Line area with hard boom and snare during flushing.

Location of Work

Mantua Creek and Commodore Perry Bridge.

Special Environmental Considerations

LONG, NARROW CREEK WITH SPOTTY OIL THROUGHOUT SAUSAGE BOOM REQUIRED. NO GRASSES SHOULD BE CUT WITHOUT STATE APPROVAL. REPORT OILED WILDLIFE TO SITUATION UNIT

Special Site-Specific Safety Considerations

REVIEW SITE SAFETY PLAN(CONTRACTORS) WITH SPECIAL ATTENTION TO PPE, SLIPS, AND TRIPS & FALLS. ALL PERSONNEL ARE REQUIRED TO FOLLOW DECON PROCEDURES IN SITE SAFETY PLAN.

Incident Name:	MV ATHOS I	Location:	Philadelphia, PA

Daily Health and Safety Message
November 30, 2004

Site Description: On-Water & Shoreline Cleanup Activities

Potential Hazards: Slippery and uneven surfaces; exposure to weathered oil; cold/heat exposure; slips, trips, and falls; and boat operations

General Safety Concerns:

ADHERENCE TO ALL PPE REQUIREMENTS

Level D (no known hazard(s))

- **Tyvek-type and /or rain gear.**
- **Hard hat when overhead hazards exist**
- **Safety glasses/goggles/face shield**
- **Work shoes**
- **Disposable boots**
- **Chemical resistant gloves**
- **Hearing protection**

NOTE: Eye Protection is NOT OPTIONAL. ANSI Approved Safety Eye Wear with Side Shields is the minimum eye protection requirement for all activities.

Personal Flotation Equipment (PFDs) are required to be worn properly—fully secured—when working on or near the waters edge. UNSECURED PFDs MEANS NO PFDs!

Gloves and sleeve area and boot and pant leg area should be taped to prevent contact with product.

Use of tobacco products of any kind and eating/drinking is restricted to designated areas only and only following proper personal decon-tamination. Contractors should clearly designate break/rest areas. Otherwise such activity is prohibited.

Special notes –

- **In the event clean up activities involve entry to industrial/commercial facilities, safety rules of the facility will apply as long as the safety rules do not contradict this Plan.**
- **ALL INJURIES REGARDLESS OF SEVERITY MUST BE REPORTED TO THE OPERATIONS CENTER AND SAFETY IMMEDIATELY AND A INCIDENT REPORT MUST BE FORWARDED VIA THE FIELD SAFETY REPRESENTATIVE**
- **In the event of a <u>non-life threatening</u> emergency the patient should, if possible, be transported out of the hot zone and decontaminated as much as possible. In life threatening emergencies, where a patient cannot be moved, medical personnel will respond into the hot zone properly attired. A second ambulance will be dispatched to transport.**
- **ALL PERSONNEL VISITING THE HOT ZONE MUST BE WEARING THE APPROPRIATE PPE.**

Safety Contact (302) 293-8958 Ed Doyle x8960 Archie Gresham

Prepared By Signature:		**Task Force:**	
Approved By Signature:			

Operations Personnel

Title	Person	Radio	Phone	Pager
Operations Section Chief	Theo Camlin		425-501-5430	
Operations Section Deputy	V. Huyck		215-778-5453	
Waterway Management Branch	LT Sligh		215-778-4534	
Vessel Management Group	ENS Munch		215-271-4805	

Resources Required

Area of Operation	Resource Type	Description	Quantity	Size
Vessel Traffic Management Grc	Manpower: Supervisor	USCG Vessel Manageme	6 each	

Assignments

Coordinate entry / exit of commercial vessel traffic.

- Prioritize departing vessels for cleanup.
- Coordinate with Vessel Decon Group Supervisor for priority vessels for cleanup and departure.

Report situation status to the situation unit each day at 0900, 1300, and 1600 hrs to the Situation Unit Leader at 267-765-3446/3448

Additional Information

Provide following information at each report:

Vessels Activity:
- Authorized Inbound
- Authorized & Arrived Inbound
- Departed
- Authorized Shift/Conduct Business
- Decon List
- Enroute Decon
- Being Deconed
- Decon Completed
- Inspection List (PA)
- Inspection List (NJ)

Incident Name:	MV ATHOS I	Location:	Philadelphia, PA

Daily Health and Safety Message

December 1, 2004

Site Description: On-Water & Shoreline Cleanup Activities

Potential Hazards: Slippery and uneven surfaces; exposure to weathered oil; cold/heat exposure; slips, trips, and falls; slippery surfaces while conducting boat operations.

General Safety Concerns:

ADHERENCE TO ALL PPE REQUIREMENTS

Level D (no known hazard(s))

- **Tyvek-type and /or rain gear.**
- **Hard hat when overhead hazards exist**
- **Safety glasses/goggles/face shield**
- **Work shoes**
- **Disposable boots**
- **Chemical resistant gloves**
- **Hearing protection**

NOTE: Eye Protection is NOT OPTIONAL. ANSI Approved Safety Eye Wear with Side Shields is the minimum eye protection requirement for all activities.

Personal Flotation Equipment (PFDs) are required to be worn properly—fully secured—when working on or near the waters edge. UNSECURED PFDs MEANS NO PFDs!

Gloves and sleeve area and boot and pant leg area should be taped to prevent contact with product.

Use of tobacco products of any kind and eating/drinking is restricted to designated areas only and only following proper personal decon-tamination. Contractors should clearly designate break/rest areas. Otherwise such activity is prohibited.

Special notes –

- **In the event clean up activities involve entry to industrial/commercial facilities, safety rules of the facility will apply as long as the safety rules do not contradict this Plan.**
- **ALL INJURIES REGARDLESS OF SEVERITY MUST BE REPORTED TO THE OPERATIONS CENTER AND SAFETY IMMEDIATELY AND A INCIDENT REPORT MUST BE FORWARDED VIA THE FIELD SAFETY REPRESENTATIVE**
- **In the event of a <u>non-life threatening</u> emergency the patient should, if possible, be transported out of the hot zone and decontaminated as much as possible. In life threatening emergencies, where a patient cannot be moved, medical personnel will respond into the hot zone properly attired. A second ambulance will be dispatched to transport.**
- **ALL PERSONNEL VISITING THE HOT ZONE MUST BE WEARING THE APPROPRIATE PPE.**

Today through Friday, partly cloudy skies are expected.

Temperatures:
Today through Friday, the temperatures are expected to range from lows in the low 30’s to highs in the mid 40’s.

Extended Outlook:
Saturday, the winds are forecast to be from the W winds 5-10 knots. Partly cloudy skies. No precipitation is expected. Seas, 1-2 feet.
Sunday, the winds are predicted to be from the SW at 5-10 knots. No precipitation is forecast.

ICS 202 - General Response Objectives

Incident:	MV Athos I	**Prepared By:**	Planning Section **at** 12/2/2004 12:00
Period:	Period 7 (12/3/2004 06:00 - 12/4/2004 06:00)	**Version Name:**	Unified Command Objectives

Overall and Tactical Objectives

	Assigned To	Status
Conduct operations in accordance with site safety plan.		
Continue implementation of vessel transit protocols to facilitate vessel movement in affected port areas.		
Implement decon plan (including decon of commercial/government vessels)		
Continue to enforce safety zone.		
Continue aggressive shoreline cleanup operation.		
Continue to assess the location and extent of oil impact.		
Continue execution of salvage plan.		
Monitor existing sensitive site booming strategies & implement additional strategies as appropriate.		
Collect and recover free-floating oil.		
Collect, recover, and rehabilitate injured wildlife.		
Continue to keep stake holders and public informed.		
Implement Disposal Plan		
Conduct assessment on submerged oil. Review options for removal		
Unified Command Emphasis:		
• Equate economic impact of spill on an equal level with environmental impacts without diverting any resources from environmental protection and cleanup		
• Accelerate effort to collect maritime industry economic information, prioritize cleanup efforts, and increase cleanup resources to minimize economic impact		
• Safety Officer to ensure that all safety issues/concerns are tailored to operations.

Vessel Decon Group	LCDR T. Scheel/Jim Kearne		215-778-4076	
Tactical Rep	Mike Noel		713-824-3991	
Safety Officer	Ed Doyle/Archie Greshan		302-293-8959/8960	

Resources Required

Area of Operation	Resource Type	Description	Quantity	Size
Vessel Decon Group	Barge: Inland	Portable Barge Set	1 each	
Vessel Decon Group	Boom	Boom	200 feet	
Vessel Decon Group	Manpower: Responder	5 person decon team	1 each	
Vessel Decon Group	Manpower: Responder	2 person assessment tea	8 each	
Vessel Decon Group	Manpower: Supervisor	Supervisors	1 each	

Assignments

- As directed clean commercial vessels in accordance with vessel decon plan (steamcleaning).
- Note any heavily impacted facilities and report information to ops.

Accomodate testing of surface washing agents

Special Site-Specific Safety Considerations

- Safety: Ensure proper PPE such as face shields are used during pressure washing operations.

Additional Information

- Conduct decon ops in accordance with Vessel Decon Group Supervisor.

- See attached Vessel Decon Plan and waterways reporting instructions.

10 Task Forces Total:

Vessel Decon Task Force 1
Vessel Decon Task Force 2
Vessel Decon Task Force 3
Vessel Decon Task Force 4
Vessel Decon Task Force 5
Vessel Decon Task Force 6
Vessel Decon Task Force 7
Vessel Decon Task Force 8
Vessel Decon Task Force 9
Vessel Decon Task Force 10

Each Task Force is comprised of equipment listed above.
